Abstract

An expanded paradigm is required to explain how public Laundromat services are implemented. Technological revolution influences countries economic growth, employment levels and wage rates. Kenya as a country is enjoying faster growth when it comes to industrialization. Public Laundromat service in Kenya is one of the concepts that have not been implemented. This paper presents a review of the extant theoretical on two constructs linked to technological revolution in the phenomenon leading to operational performance. Conceptualization and examination of the knowledge gap concept and techniques for implementation of public Laundromat services by the county government are critically discussed, in order to be on the bigger picture of vision 2030 agenda in Kenya. The paper will also discuss the techniques used to operationalize this concept and make it understandable for research participants and beneficiary of the study who are the county government for the proper implementation of the idea. The relevant theories constructs are reviewed, their operational indicators identified and emergent knowledge gaps identified. The theories underpinning the study include dynamic capability theory, the relationship marketing theory, evolutionary economic theory and innovation diffusion theory. This paper proposes the implementation of mixed research method, simple random sampling technique and use of questionnaire for data collection. The paper finally proposes a multidisciplinary based to advance knowledge gap by county government on implementation of public Laundromat services in this area together with the accompanying implications for future research.

Keywords: ***Technological revolution, Operational performance, Public Laundromat services***

1. Introduction

The thrust of investment in developed countries has created entities enhanced technology in form of invention and innovation that has led to increased efficiency of laundry machines in terms of turn-around timelines (laundry within an hour unlike earlier several days) quality of service, and the most environmentally beneficial being significantly less consumption of water, energy and cleansing agents.

Regardless of societal status, education level, and economic performance, food, shelter and clothing are among the most basic needs of the human person. Consequently, doing laundry is an indispensable part of everyone's lifestyle and dates back to the introduction of garments. The only variance is in how the laundry is done, as there are two major ways; namely washing manually and using washing machines.

Developing countries like Kenya, most public institutions are experiencing detritions in terms of performance due to both internal and external issues (Magutu, et al., 2010). Due to various factors including lack of time, inabilities and lifestyle choice, some people outsource the washing of their own clothes; this led to the birth of payable laundry outlets. According to the United States Environmental Protection Agency (EPA, 2002) laundry is the second highest consumer of water domestically (after toilets). This therefore means that any effort towards minimize usage of water for laundry will make a significant impact on water conservation efforts.

The purpose of carrying out this study was first to, discussed the techniques used to operationalize this concept and make it understandable for research participants and beneficiary of the study who are the scholars, policy makers, general public and government for the proper implementation of the idea. Secondly, a review of the theoretical conceptual literature and methodological gap on the constructs showing the relationship between technological revolution and operational performance critically reviewed. Lastly, the study proposes a conceptual model for implementation of the relationship that exists between technological revolution and operational performance.

2. Public Laundromat services

Laundromats are cleaning services that have been actualized mostly in the west. In the Laundromat the users who are the clients are required to pay a small token preferably using a coin for each load of the cloth. The Laundromat owners need to provide a simple payment system that can be loaded with the token once a client what to use the services.

Despite the compelling need for every household to do laundry regularly, water continues to be a limited hence scarce resource; more so for Nairobi residents who must contend with frequent rationing (Water

Services Regulatory Board (Kenya) Impact Report, 2018). While the government of Kenya strives to address the water problem by addressing the supply side e.g. Ruiru 2 and Karemenu 2 dam projects, there is need to consider a more sustainable approach by addressing the demand side of the equation. In a speech read on his behalf during the Africa Green Building pre-summit in Nairobi, Retired President Kibaki (2017) and the Unesco special envoy for water in Africa, challenged Kenyans to rethink water conservation at household level.

Recognizing that not all Kenyans can afford washing machines which would allow for economical usage of water for laundry, this study proposes that the County Government of Nairobi considers undertaking installation of laundry marts at strategic locations within Nairobi County. Residents would then pay a fair fee for using the service, which would allow for sustainability of the service; as is the case with the public toilets project in the county. The county government will then redirect all water from these laundry marts and sanitize it for recycling to flush toilets and wash cars, among other secondary uses.

3. Problem statement

In pursuit of achieving technological revolution aspect operational performance has to be considered. This study was undertaken to empirically review the relationship between technology revolution and operational performance on introduction of public Laundromat. However, the aspect of operational performance on public Laundromat is a buzzword that has not well be conceptualized by most authors (Teece, Pisano, & Shuen, 1997).

The use of different conceptualization on the operational performance of public Laundromat by different authors is an issue that needs to be addressed because of mixed up contradictions (Olepein, 2015;Eristavi, 2012;Teece, 2007). Anecdotal evidence as provided by business daily on Sunday 2017 revealed that public Laundromat concept has not been operationalized in Kenya. Consequently, the theories and models used to anchor aspect of operational performance lack commonality.

Lastly the numerous definition of operational performance that lacks meaning sometimes is a key issue to address (Kiprotich, Njuguna, & Kilika, 2018;Olepein, 2015;Eristavi, 2012). This being a contradiction there is need to seek common grounds when bringing up the concept of operational performance based on different market environment or economies. In construst therefore the study sourt to establish the knowledge gap on technological revolution and operational performance on implimentation of public laundromat services in kenya.

4. Theoretical Conceptualization of key constructs

To fulfill the fundamental question on the objective of this study, this section shows a brief summary of theoretical conceptual literature applied. This call for in-depth understanding of these concepts as pertains to this study. This section therefore reviews the constructs theoretically that anchor the study which includes, dynamic capability theory, relationship marketing theory, the evolutionary economic theory and innovation diffusion theory.

4.1 Dynamic capability theory

The dynamic capability theory was developed by(Teece & Pisano, 1994).the theory tries to configure how most firms, integrate, build and reconfigure the internal and external specific competencies into new competencies that match their turbulent environment(Olepein., 2015).The concept of dynamic capabilities arose from a key shortcoming of the resource-based view of the firm. Several authors have used different constructs toward the main theoretical contribution to dynamic capability theory. According (Teece, Pisano, & Shuen, 1997) proposes the dynamic capability theory considers process, positions and path as the key prepositions anchoring the theory. Similarly, Eristavi(2012) ascertain dynamic capabilities refer to efficient exploration and implementation of new resources and recommends efficiency as a construct on dynamic capability. Further, Teece (2007) developed the component of efficiency- based to show how firm specific capabilities could be of importance and how combinations of competencies and resources can be developed, deployed and protected. Therefore, the theory is applicable to this study because by introduction of public Laundromat services the service providers can enhance operational performance to provide efficiency and effectiveness services.

4.2 The relationship marketing theory

Berry(1983) developed the relationship marketing theory. Relationship marketing theory is a form of marketing developed from direct response marketing campaigns which emphasizes customer retention and satisfaction, rather than a dominant focus on sales transactions (Alexander, Schouten, & Koenig, 2002). The theory is relevant to the study since it ensures retention of customers in the service providers through varying means and practices to ensure repeated trade from preexisting customers by satisfying requirements above those of competing companies through a mutually beneficial relationship (Albers-Millers & Straughan , 2009).

4.3 The evolutionary economic theory

Nelson and Winter (1982) can be perhaps be credited for developing the evolutionary economic theory and their motivation was on the need to explain a wide range of phenomena associated with economic change stemming either from shifts in product demand or factor supply conditions, or from innovation in parts of the firm. The different aspects on economic change included the response of firms and the industry to changed market conditions, economic growth and competition through innovation.

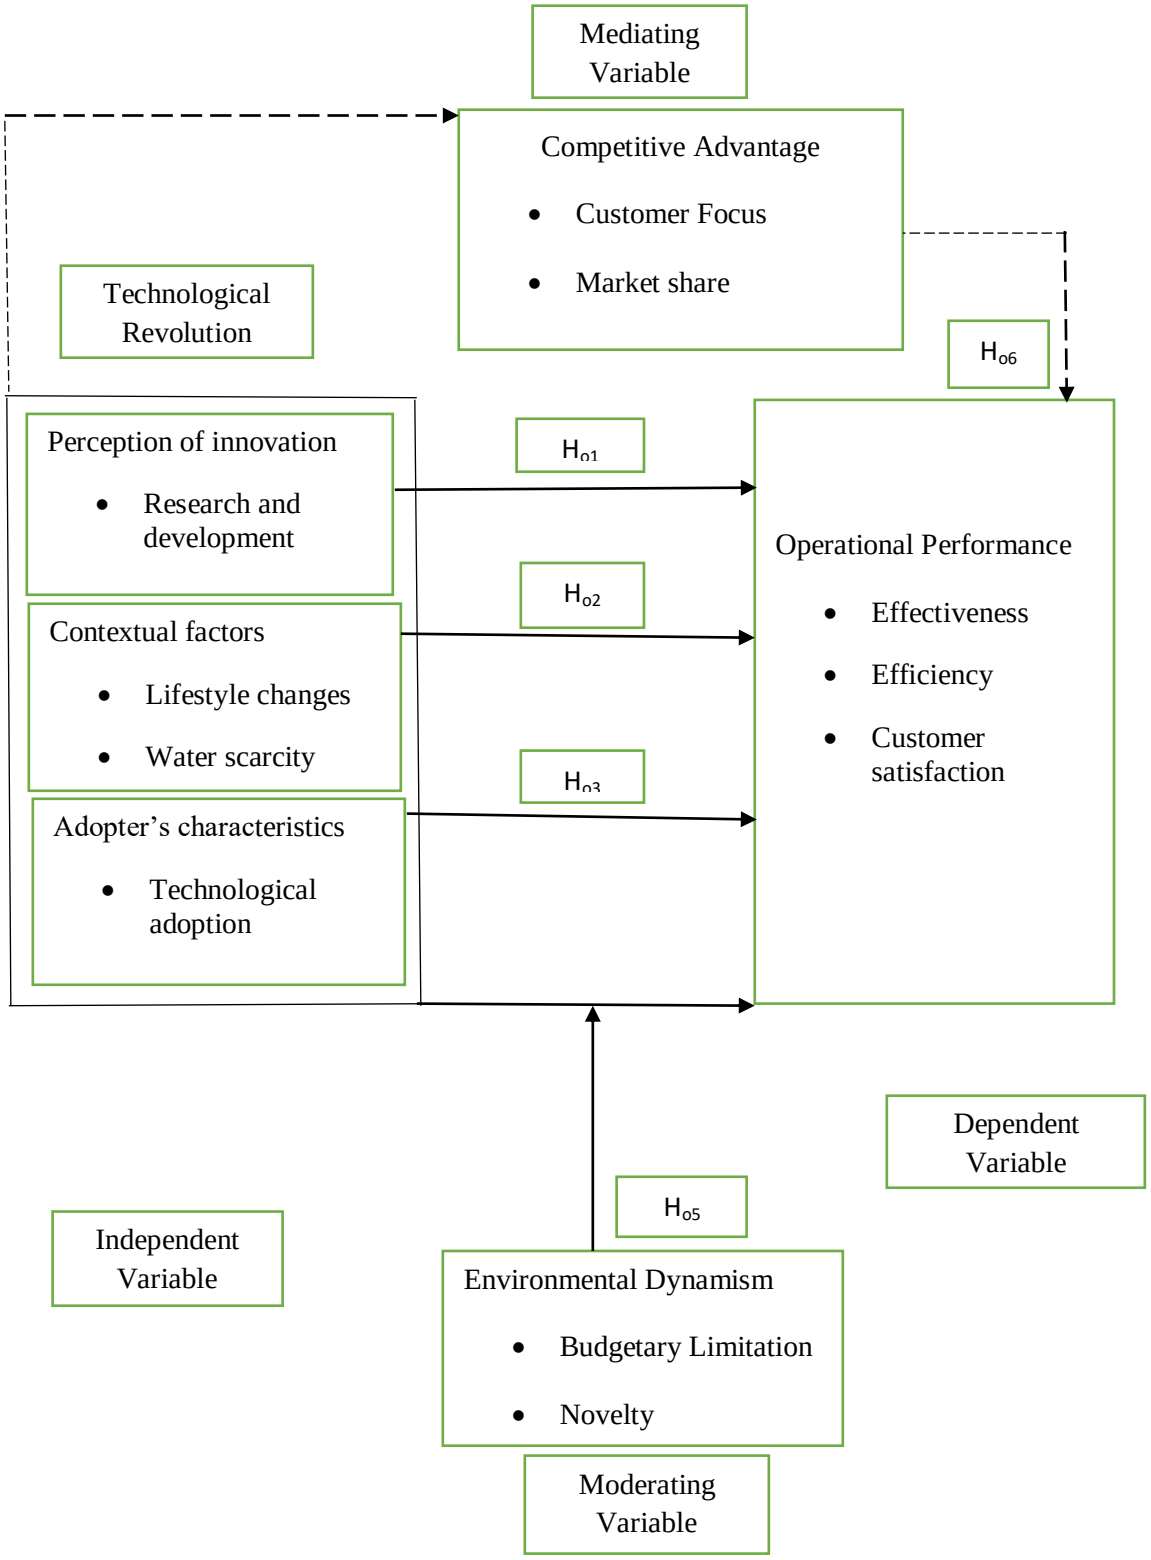
Nelson and winter (1982) proposed organizational routine for all regular and predictable behavioral patterns of firms and defined routine as "a repetitive pattern of activity in an entire organization, to an individual skill, or to smooth uneventful effectiveness of such an organizational or individual performance". They propose organizational routines to include characteristics of firms that range from technical routines for production, through hiring and firing procedures, ordering inventory, or stepping up production of items in demand, to policies regarding investment, research and development (R&D), or advertising, and business strategies about product diversification and overseas investment.

4.4 Innovation diffusion theory

The theory of innovation diffusion was implemented by(Rogers, 1995). Innovations referring to technologies, ideas, practices or products that are alien to the society and which are spread and shared through communication by members of the society (Rogers, 2009). This theory suggested the three main sources that influence the diffusion and adaption of an innovation includes perception of innovation characteristics, adopter's characteristics and contextual factors. The theory emphasizes that innovation spreads slowly over time and among people resulting in various adopter categories. This theory is applicable to study the technological revolution in such a way it could bring about significant changes to public Laundromat work practices and could also cause resistance to change.

5. Proposed conceptual framework linking technological revolution and operational performance

Competitive advantage has been proposed as a mediating variable with measures being the customer focus of Laundromats, and the anticipated capture of a huge market share given that laundry service is required by all. The projected convenience and affordable service costs will facilitate change of behavior from washing manually to using Government provided Laundromat services. The moderating variable for the proposed study would be environmental dynamism whereby the County government may be constrained financially to undertake this massive project, or the concept, like all new ideas, may encounter some resistance from opponents of change both at policymaker and consumer levels.



Source: Researchers (2019)

6. Proposed methodology

This study recommends adoption of mixed method research designs. Saunders, Lewis and Thornhill (2009) combining different designs in one study enables triangulation in addition to increasing the validity of the findings to achieve optimal results. Consequently, simple random sampling technique is recommended for selecting respondents for this study. The study will rely on primary data collection method. Semi-structured questionnaire will be used for data collection method whereby they will be administered via drop and pick. The respondents of the study will be selected based on the knowledge and information of Laundromat services in Nairobi estates. The use of multiple regresion model will be used for data analysis. However, this study will employ the use of descriptive statistics and inferential statistics with the help of Statistical Package for Social Sciences (SPSS) version 20 to achieve the objectives of the study.

7. Conclusions and Recommendations

From the reviewed literature as well as basing on the success stories where public Laundromats have been implemented, there is evidence of a strong case for the County Government to invest in public Laundromats with enhanced value of leading from the front in water conservation efforts. As clearly illustrated, doing laundry is a universal basic need; just like water conservation is for the common good of all habitats of mother earth. Therefore, not only will this become a flagship project in management of water as a scarce resource, it will attract development partners seeking to replicate the same across the country and the world at large. There is need, therefore, for further research in this area, so as to fast-track the implementation of the concept of public Laundromats given the economic and non-monetary benefits it promises.

Based on the theories discussed, the study conclude, Dynamic capability theory, relationship marketing theory, evolutionary economic theory and innovation diffusion theory are significant theories that are used for discussion of technological revolution and operational performance for future successive implementation of public Laundromat services. Further, the study proposes a knowledge gap in the area of technological revolution and operational performance in the implementation of public Laundromat in Kenya. The study was conducted on the technological revolution and operational performance but similar studies would be conducted on other variables apart from the one discussed to show their relationship to capture the public Laundromat services contextual aspect.

Saving and Credit Cooperative (Sacco) Strategic investment expansion decisions and financial performance for a better Kitui central sub-county

Acronyms

SASRA Sacco Societies regulatory authority

Sacco Savings and credit cooperatives

ICA International Cooperative Alliance

KNBS Kenya National Bureau of Statistics

ILO International Labour Organization

1.0 Introduction

The Cooperative movement in Kenya is the most vibrant ranking first in Africa and seven in the whole world. In April 2019, the daily reported that "Against all odds, Sacco continue to make super normal profits."As a developing nation, Kenya's devolution process has propelled Sacco as avenues for achieving Vision 2030 through mobilising savings, creating jobs and alleviating poverty for her citizenry. This is in accordance with Njeru, Agnes, Florence and Ondabu (2015) who assert that, 63% of the Kenyan population are involved directly or indirectly in Sacco increasing financial assess in the country. The Sacco continues to command profits even with the vibrancy of mobile banking and existence of the contemporary banking sector.

Sacco is an important party in addressing the Kenya Big four agenda through their participation in the building sector with the SASRA report of 2018 asserting that, the largest proportion of Sacco lending

totalling 118 Billion and accounting for 36% of the total outstanding credit as at December 2016 was channelled towards land and housing sector. According to World Bank report of 2017, it is estimated that up to 90% of housing finance in Kenya is supplied by savings and credit cooperatives and housing cooperative networks. With this seemingly bright star, the Sacco business has also had its own share of challenges especially in the area of investment decisions some case in point being Egeza; Stima and Mwalimu Sacco investments. This necessitates strategic investment expansion decisions.

1.2 The Overview of Sacco business

According to International Cooperative Alliance (ICA) (2014) and Kivuvo and Olweny (2014) a cooperative is an autonomous association of persons who voluntarily unite so as to meet their common economic, social and cultural needs and aspirations through a jointly owned and democratically controlled enterprise. The Cooperative Societies Act chapter 490, defines a cooperative society as a society registered under section four of the Act.

The Sacco Society's Act 14 of 2008 defines a Sacco society as a savings and credit cooperative society registered under the Cooperative Societies Act (no.12, of 1997). Lari (2009), on the other hand defines a saving and Credit Cooperative (SACCO) as an undertaking whose main objective involves pooling together of member savings and providing credit facilities in return; SASRA website, defines a Sacco as a financial cooperatives. Compared to other financial institutions, Sacco's are unique considering their financial performance measurement since they use declared dividends and surplus or deficits announced to measure financial performance (Momanyi, 2014).

According to Amalendu, Somnath and Gautam (2011) financial performance of a firm is its overall financial health over a given duration of time or a Sacco's ability to utilise assets to generate revenues. Sacco financial performance in this study adopted Dividends and surplus as adopted by Muriuki (2015). Sacco compete with banks in the financial sector utilising the benefits advanced to customers in form of dividends and cheap loan products vs. Lower capped interest rates and longer loan periods from banks (Kagonia (2017).

Sacco performance in 2017 according to SASRA indicated a diminishing rate of growth in total assets, gross loans and total deposits at 12.4%, 11.3% and 12% respectively, compared to growth rates of 14.8%, 15.3%, and 14.8% respectively which was registered the previous year. The non-performing loans as indicated by loan allowance showed an upward trend to reach 10.7 billion which is an increase of 23.4% from Kshs 8.6 Billion recorded in 2016.

1.3 Strategic Investment Expansion Decisions

According to James and John (2010) expansion decisions involve the addition of new products, new lines of business/production, and addition of capacity or diversification of operations. Pandey (2015) asserts that an organizations' expansion involves increase in existing capacity so as to expand existing operations. Bang (2010) asserts that, an expansion strategy involves: improving consumption & purchasing ability, improving willingness to buy, creating affordability and improving sustainability. Organizations have set short-term and long-term goals and objectives which guide their operations and hence investment expansion decisions have to align to these goals for them to be realized.

People join a Sacco with an economic motive of generating income; this implies that, members will join a Sacco when the economy is in viable state (Mpiira, et al., 2013). According to Hesse and Cihak (2007) Sacco still retain their stability even during crisis periods since their investment pattern utilises member's capital strategically to satisfy both short term and long term needs and interests. This is because, Sacco create synergies that support territory resilience to external shocks and they are typically motivated by long-term gains as compared to short term gains, making expansion investment strategies less risky (International Labour Organization-ILO, 2009).

1.4 Overview of Kitui Central sub-county

According to Kenya national bureau of statistics-KNBS report of (2013), Kitui County which is in arid and semi-arid parts of Kenya experiences one of the highest inequality levels in the country in terms of differences in lifestyles and access to services and hence presents a good diversity for Sacco membership. It

is also stated to posses the largest area coverage in kilometre (KM^2) compared to all other counties of eastern Kenya combined together. Despite the above, Sacco distribution in the county in terms of location is concentrated in Kitui central sub-county with only a few in Mwingi Town (SASRA, 2018)

1.5 Reasons for this study

Due to the unique nature for Sacco's in their concern for time when making investment expansion decisions, there's a great need for them to be strategic This will help them in meeting the diverse needs for its members and sustaining the Sacco to achieve its vision, mission and goals. Without a focus on strategic investment expansion decisions, managers can end up engaging in doubtful investments, negatively affecting members' confidence and face challenges in addressing the needs for the new members. It should be noted that, reversing a wrongly made investment decision also comes at a cost.

LITERATURE REVIEW

2.1 Theoretical Review

This research work is anchored on two theories; the product life cycle theory by Raymond Vernon (1966) and Modigliani and miller theory by Modigliani and Miller (1950). The product life cycle explains the benefits a firm obtains on expanding across borders through technology and innovation which maximises returns and optimises costs. This theory helps in addressing the effects of different Sacco expansion policies adopted. On the other hand, Modigliani and Miller theory (1950) indicates that, financing a firm which is a form of expansion on capital structure does not influence the firm's value due to market imperfections. This theory addresses Sacco welfare in case of strategic investment expansion decision given different capital combinations.

2.2 Empirical Review

Farok, Kumar and Sumit (2007) did a study on the nature of the relationship between international expansion and performance; the case of emerging market firms. They compared internationally expanding firms with their rivals from emerging economy (India). Their study results indicated a U-shaped curve

depicting internationalization-performance relationship in India with service firms gaining more positive benefits of internationalization expansion than manufacturing firms.

Richard, Jonathan, and Sharon (2004) conducted a study on business climate and international franchise expansion by examining how a country's business climate affects international expansion decision of US franchise companies. The study was testing various hypotheses on how franchise companies international plans are influenced by elements of a country's business climate. The study estimated a panel regression model using different specifications. The study results supported the hypotheses and demonstrated that a country's business climate is an important predictor of foreign firm's expansion into that country.

Roger and Paul (2010) does a study on the question, does asset allocation policy explain, 40, 90 and 100 percent of performance? The study adopted a balanced mutual fund and pension fund data to answer the question. The study found out that 40% and 90% of fund performance is explained by expansion policy while 100% of fund performance is explained by policy return level.

Vishal and Kesava (2007) did a study on the effects of firm size and sales growth rate on inventory turnover performance in the US retail sector with respect to size, the study found a strong evidence of diminishing returns to scale. With respect to sales growth rate the study found out that inventory turnover increases with sales growth level but rate of increase depends on firm size and on whether sales growth rate is positive or negative.

2.3 Study methodology

This research adopted an empirical research design and used time series data for the periods 2009 to 2019. Targeted population consisted of twelve (12) Sacco in Kitui Central Sub-County. The researcher used census to collect data from all sources from the finance officer of each Sacco. Both primary and secondary data were used in the study. Simple multivariate analysis was conducted using statistical package for social sciences (SPSS-Version 21) and data presented by the use of tables. The models adopted were as follows;

$Y_1 = \beta_0 + \beta_1 ED + \varepsilon$ and $Y_2 = \beta_0 + \beta_1 ED + \varepsilon$

Whereby; Y_1= Performance as measured by dividends

Y_2 =Performance as measured by surplus

β_0 =Constant term or the Y-intercept for both equations

β_1 = Regression coefficients or slope of the regression lines

ED = Expansion decision

ε = Represents the error term

The researcher sought to determine the effect of strategic investment expansion decisions on the financial performance of Sacco as measured by dividends and surplus

STUDY FINDINGS

3.1 Strategic Investment Expansion Decisions on Financial Performance of Sacco

Strategic investment expansion decisions were found to affect Sacco performance as measured by dividends in the following ways

3.1.1 Correlation

		ED	DIV
Expansion decision (ED)	Pearson Correlation	1	.485
	Sig. (2-tailed)		.155

The results above indicate a positive relationship between expansion decisions and Sacco performance measured by dividends though the relationship is not significant at 5% significance level.

3.1.2 Model summary

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate	Change Statistics				
					R Square Change	F Change	df1	df2	Sig. F Change
1	.485[a]	.236	.140	4.42998E7	.236	2.465	1	8	.155

a. Predictors: (Constant), total strategic investment expansion decisions in Sacco

Results indicate that 23.6% of Sacco performance as measured by dividends is explained by strategic expansion decisions while 76.4% is explained by other variables.

3.1.3 ANOVA

.		Sum of Squares	Df	Mean Square	F	Sig.
1	Regression	4.837E15	1	4.837E15	2.465	.155[a]
	Residual	1.570E16	8	1.962E15		
	Total	2.054E16	9			

a. Predictors: (Constant), total strategic investment expansion decisions in Sacco

b. Dependent Variable: illustration of total dividends allocated

The model asserts that the effect of strategic investment decision on Sacco performance measured by dividends is not statistically significant at 0.05% level of significance at 0.155

3.1.4 Coefficient table

Model	Unstandardized Coefficients		Standardized Coefficients	T	Sig.	Collinearity Statistics	
	B	Std. Error	Beta			Tolerance	VIF
1 (Constant)	1.137E8	1.916E7		5.932	.000		
total STRATEGIC expansion investment in Sacco	.094	.060	.485	1.570	.155	1.000	1.000

a. Dependent Variable: illustration of total dividends allocated

Given the above results, the model can be illustrated as follows; $Y_1 = 1.137E8 + \beta_1 0.094 + \varepsilon$

This indicates that, on assumption that there are no strategic expansion decisions; Sacco performance as measured by dividends will increase by 1.137E8, while if strategic expansion decisions increase by one unit, Sacco performance measured by dividends will increase by 0.094

3.2 Strategic Investment Expansion Decisions on Financial Performance of Sacco

3.2.1 Correlation

Strategic investment expansion decisions were found to affect Sacco performance as measured by surplus in the following ways

		ED	SURPLUS
Expansion decision (ED)	Pearson Correlation	1	.738
	Sig. (2-tailed)		.015

The results of the study showed a strong positive correlation between Sacco performance measured by surplus and strategic expansion decisions. The correlation between the two variables is significant at 5% level of significance.

3.2.2 Model Summary

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate	Change Statistics				
					R Square Change	F Change	df1	df2	Sig. F Change
1	.738[a]	.544	.487	1.76738E7	.544	9.547	1	8	.015

a. Predictors: (Constant), total expansion investment in Sacco

Results indicate that 54.4% of Sacco performance as measured by surplus is explained by strategic expansion decisions while 45.6% is explained by other variables.

3.2.3 Anova

Model		Sum of Squares	df	Mean Square	F	Sig.
1	Regression	2.982E15	1	2.982E15	9.547	.015[a]
	Residual	2.499E15	8	3.124E14		
	Total	5.481E15	9			

a. Predictors: (Constant), total expansion investment in Sacco

b. Dependent Variable: Illustration of total Surplus realized by Sacco

The model asserts that the effect of strategic investment decision on Sacco performance measured by dividends is statistically significant at 0.05% level of significance at 0.015

3.2.4 Coefficients

Model	Unstandardized Coefficients		Standardized Coefficients	T	Sig.	Collinearity Statistics	
	B	Std. Error	Beta			Tolerance	VIF
1 (Constant)	2.556E7	7644001.475		3.344	.010		
total expansion investment in Sacco	.073	.024	.738	3.090	.015	1.000	1.000

a. Dependent Variable: Illustration of total surplus or deficits realized by Sacco

Given the above results, the model can be illustrated as follows; $Y_2 = 2.556E8 + \beta_1 0.073 + \varepsilon$

This indicates that, on assumption that there are no strategic expansion decisions; Sacco performance as measured by surplus will increase by 2.5567E8, while if strategic expansion decisions increase by one unit, Sacco performance measured by Surplus will increase by 0.073

The results of this study indicate that, strategic investment decisions have a weak positive correlation to Sacco performance measured by dividends. This is supported by the positive contribution strategic investment decision has on financial performance of Sacco. However the model does not have a significant effect on financial performance. This supports Modigliani and Miller Theorem of 1958 as the theory stated that increase in investment does not have significant effect to firm performance due to ever present market imperfections. This is supported by Vishal (2007) who asserts that expansion to inventory turnover increases sales growth and Roger (2010) who asserts that asset expansion policy explains the 40, 90, and 100% fund performance.

On the other hand, is also indicated in that strategic expansion decisions have a strong positive correlation to Sacco performance as measured by surplus. This is supported by the positive contribution Sacco surplus has on financial performance. In addition to this, the model has a significant effect to Sacco performance at 0.05% level of significance. This is in support with Rose (2003) who states that modern day Cooperative

decision to expand into services has made them to increase on funds to the Cooperative. Also Farouk (2007) states that service firms get more gains of international expansion as compared to manufacturing firms. The findings also support the product life cycle theory which indicates that returns to a firm increase with expansion.

3.3 Conclusion

In view of the aforementioned analysis, this study concludes that, strategic investment expansion decisions positively affect Sacco performance as measured by dividends issued and surplus. The study also confirms that strategic investment expansion decisions affect Sacco's performance more on Sacco surplus because the surplus makes up the retained earnings which the Sacco utilises for its expansion policies.

4.1 Recommendations for further study

This study focused on strategic expansion decisions alone excluding all other strategic financial functions which can be studied too. Other measures of financial performance can be studied in relation with strategic expansion decisions. The study can also applied to cooperative sector and compare the results with Sacco results.

ABSTRACT

The development of any country cannot be complete without the contributions of the SMEs. They provide significant contribution in all sectors of the economy. They serve as the hub for employment, innovation and improving the standard of the people in the country. The SMEs sector is impeded by factors beyond their control among them are tax policies that are injurious to their growth and development at all stages of

their development such as resource maturity, take-off, success, survival and existence. Twelve (12) variables such as tax laws should be simplified enough for SMEs, tax burden should be lighter to SMEs, tax rate should be rational and appropriate to SMEs, tax policies should favour SMEs to grow, double taxation and other factors are militating against the growth of SMEs and poorly executed tax are disincentives to the taxpayer among others were selected to assess its effect on the various stages of development of SMEs.

The study employed descriptive design. Primary data was collected on valuables contributing to tax influence and their effect of the growth of SMEs. A sample of 114 respondents representing 53% of target population of 215 SMEs in the New Juabeng Municipality of Ghana was selected through stratified sampling techniques. Data was collected through questionnaires, interviews and observations were analyzed through SPSS to evaluate the effect of these variables on stages of growth of SMEs. The study found that there was a significant correlation between taxation and SMEs sector growth. The study recommends that tax laws should be simplified enough in order to make compliance easier for SMEs. Again, most SMEs are liquidated at early stages as a result of multiple tax system. The Government can therefore lower the tax rate of SMEs at early stage to ensure their survival and growth.

Keywords: Tax Policy, Take-off, Survival, Resource Maturity, Growth.

1. Introduction

Economic growth in every country is defined by the performance of its production sector. In many highly developed countries, a great share of production is manufactured by small and medium enterprises (SMEs).It is acknowledged worldwide that small and medium enterprises (SMEs) are the engines of economic development and industrial growth, solving the twin problems of unemployment and poverty. They are said to account for approximately 95% of all the companies in the world. Small medium enterprise's Ghana Award (SMEGA '14).

There has not been any general definition of small and medium enterprise (SMEs). Some define it in terms of their total number of employees while others also define it in terms of the size of capital investment. The European Union defines Small and medium-sized enterprises (SMEs) as non-subsidiary, independent firms

which employ less than a given number of employees. This number varies across countries and the most frequent upper limit designating an SME is 250 employees.

SMEs are important for poverty reduction; they tend to employ poor and low income workers. These businesses are sometimes the only source of employment in poor regions and rural areas. SMEs inadvertently, are the panacea to unemployment and poverty reduction in developing countries like Ghana. SMEs have the potential to contribute substantially to the economy and can provide a strong foundation for the growth of new industries as well as strengthening existing ones.

In Ghana, SMEs contribute immensely to the industrial output and export of goods and services. They play an important role as the engine of growth of our economy registering about 90% of businesses in Ghana with about 70% contribution to GDP, accounting for 85% manufacturing employment and 75% general employment (SMEGA '14).

It has been recognized that SMEs creates the needed employment and creates a vibrant economy for any country. It has also been recognized that taxes any the only means through which the nation can mobilize the needed resources for infransture development. Taxes serve as payment imposed by the government on the citizenry. This serves as the only source of revenue for the nations at large. Without taxes Government income and expenditure would fall short. However, tax policies of every country are closely related to the type of business enterprises in that country. These policies must favour these enterprises to ensure their growth. As these businesses grow and flourish they create more opportunities for the citizenry to better their lives. It could be deduced that taxes and business growth must depend on each other for growth of the economy. If taxes are higher to the disadvantage of the various enterprises it cripples them at early stages and they cannot grow. Governments all over the world take taxes to meet the aspiration of people. The Government of Ghana, in its attempt to widen the tax base and collect more revenue has had to levy the SMEs which constitute a large part of the formal sector. These taxes charged include; corporate tax, income tax, capital gains tax, value added tax (VAT), tax on interest and many others. Although all the taxes are

important to be investigated, but for the purposes of this study, the researcher would like to investigate income tax which is levied (SMEs) in the New Juabeng Municipality of Ghana.

The lifeblood of any economy is taxation. It helps Governments to generate the needed revenue to provide social amenities and maintain law and order. SMEs and taxation are not mutually exclusive by any means. In a study conducted by (Ojeka, 2011), on "taxes have been more harmful to the survival of SMEs" produced a surprising result of high tax rates, multiple taxation, complex tax regulations and lack of proper enlightenment or education as the major challenges of SMEs. In this work, the researcher investigates the effect of taxation SMEs growth and development.

The general objective is to evaluate the variables chosen and its effect on SMEs and the effect of taxation on the stages of their growth.

Objective of the Study

1. To find out the effects of government taxation policy on SMEs in Ghana
2. To evaluate the effect of taxation on SMEs stages of growth.

Hypothesis:

H_o: There is significant relationship between tax and the SME's stages of growth.

The study would be useful to all stakeholders in the country particularly tax authorities and all SMEs that fall within the tax bracket. It would also inform policy makers to adjust tax policies to suits the requirement of small medium enterprise.

LITERATURE REVIEW

2.1 Conceptual Framework

Mungaya, et al (2012), in their work on "tax systems impact on the growth of small and medium enterprise (SMEs): with reference to shinyanga municipality, Tanzania" adopted this conceptual framework which would be used in this research work.

Conceptual Framework

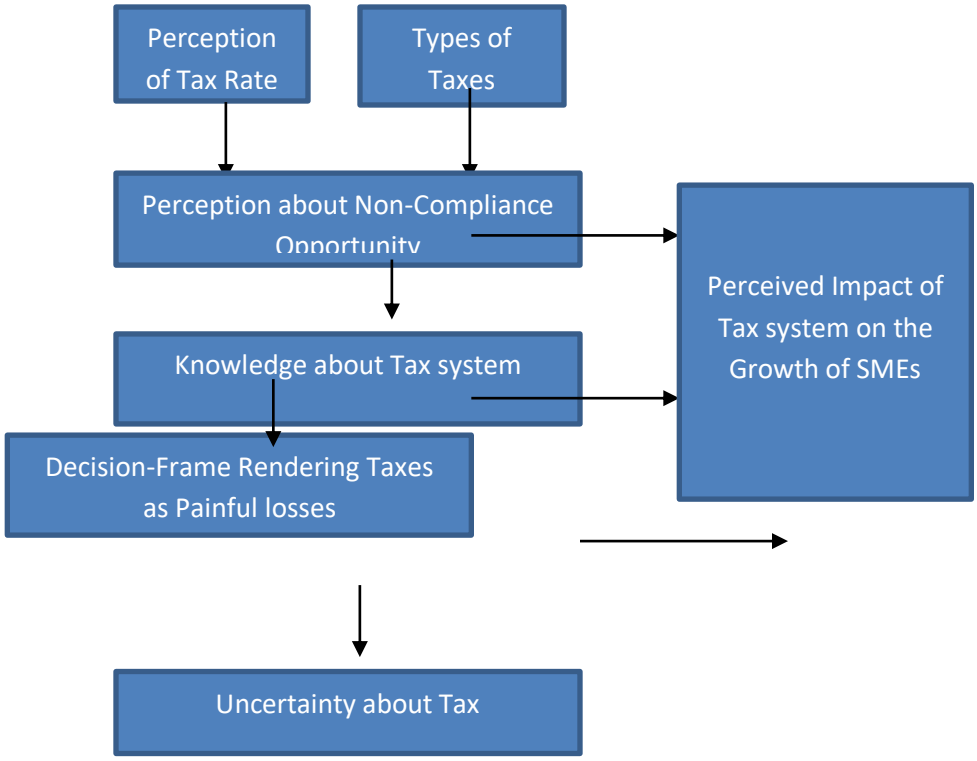

Fig. 1: Conceptual Framework of the Research

2.2 Theoretical review

Theories of Business Growth

Researchers have propounded theories on stages of business growth. One of such well known theory is the one propounded by Gibart (1931) that is the " Law of Proportionate Effect" cited by Elhiraika & Nkurunziza (2006) in their work "Facilitating firm entry, growth and survival with special attention to SMEs" stated that the rate at which businesses grow are independent to its initial size. This means that large firms are holds the key to private sector growth and development because they could employ more people compared to small businesses. Notwithstanding, Jovanovic (1982) also stated that small firms grow faster in the economy with respect to time. In his model, that is the 'Learning model' he said "because small firms

acquire experience over time and this help them to perform better". The researcher was of the view that small businesses grow faster than old firms. He concluded that there is a point of convergence for small businesses and large firms where small businesses also become as large firms. Churchill and Lewis (1983) as cited in Olawale & Garwe (2010) stated that small businesses go through growth stages as: existence, survival, success, take-off and resource maturity. In all the stages of business development different factors invariable affect its survival and success. The Churchill model helps us to identify the stages of development of SMEs. The exact time when start-ups become new business has not been theoretically ascertained. In other words, the idea of business survival could be equated with a firm that has fully completed the transition from the initial stage to the next stage in the five stages of small business growth. Churchill and Lewis (1983) stages of business development would be adopted by the researcher to assess the effect of taxes on businesses in Ghana.

2.4 Empirical framework

Researchers have conducted extensive work on tax policy and its effect on the economy of countries. In the work of Ojeka (2011), on "tax policy and the growth of SMEs: implications for the Nigerian Economy at Covenant University, Nigeria" stated that friendly tax policy is the only instrument that could survive the growth of SMEs. Notwithstanding, taxes have been more harmful to the survival of SMEs because as they increase running costs and it slows down their growth. He realized that most SMEs face problem of high tax rates, multiple taxation, complex tax regulations and lack of proper enlightenment or education about tax related issues.

Mungaya et.al., (2012), in his work on "Study of Tax System Impact on the Growth of Small and Medium Enterprises (SMEs): With Reference to Shinyanga Municipality, Tanzania" at Mzumbe University Dar Es Salaam, Tanzania also opined that changes in tax rates lead to the changes in prices of various goods and services. This normally results in higher production, distribution and selling costs which lead to higher prices which eventually leads to change in behavior of consumers.

Kamar (2015), in his work on "Effects of government taxation policy on sales revenue of SME in Uasin Gishu County, Kenya" at Kisii University Eldoret Campus (Kenyatta University)

Said that taxes have both positive and negative effect on SMEs therefore Governments should levy SMEs lower rate to ensure their survival.

PONORÎCĂ and Juhi AL-SAEDI H (2015) in their work on "the importance of taxation systems for SME tax compliance" said the tax system of SMEs should be simplified in a more comprehensive manner for their understanding.

Ocheni and Gemade (2015) in their work on "Effects of Multiple Taxation on the Performance of Small and Medium Scale Business Enterprises in Benue State" said that multiple taxations have negative affect on the survival and growth of SMEs in Benue State. Therefore, tax authorities in Africa should take a critical look at it.

3.0 RESEARCH METHODOLOGY

A survey method was used for the study since the views of corporate employers on effect of tax small and medium scale enterprises in the New Juabeng Municipality of Ghana.

3.1 POPULATION

The study was conducted among small and medium scale enterprises in the New Juaben Municipality in the eastern region of Ghana. The population of registered small and medium

scale enterprises in the municipality is broken down as following;

Table 1: Population of Employers in the Municipality

Source: NBSSI Koforidua, 2018.

Size of Firm	Population	Percentage
Small scale Enterprises	86	40
Medium Scale Enterprises	69	32
Large Scale Enterprises	60	28
Total	215	100

3. Sample size

The major participants in the informal sector that is to say the small-scale business was too wide so there was a need to choose a few manageable respondents to participate in the study. The size of the sample and the way in which it was selected would definitely have implications on the confidence one can have in the data and the extent to which the team can generalize. The study adopted the formula from (deVaus 2002), Surveys in Social Research with the following assumptions; 95% confidence level, 5% margin of error and estimated heterogeneity of the population to be 20%.

n= p%* q%* [z/e%]^2

Where n is the minimum sample size required

p% is the proportion belonging to the special category

q% is the proportion not belonging to the special category

z is the value belonging to the level of the confidence level required, and

e% is the margin of error.

n= 0.20*0.80*[1.96/0.05]^2

n= 245

Based on the sample size of 245 an adjusted sample size can be obtained as

N' = n/1 + n/N

Where; N' is the adjusted sample size, n is the minimum sample size and N is the total population.

N' =245/1+ [245/215] =114.8696

N= 114

The adjusted sample size was 114 which represented 53% of the total population of SMEs in New Juabeng Municipality.

Table 2: SMEs selected for the study.

Size of Firm	Population	Sampled
Small scale Enterprises	86	46
Medium Scale Enterprises	69	36
Large Scale Enterprises	60	32
Total	215	114

In order to gather information on the effect of taxation on SMEs growth and development, a questionnaire survey was conducted. The questionnaire instrument was developed using a 5- point likert after which it was administered to some lecturer at Koforidua technical University. After the pilot test some corrections were made and the final questionnaire came out. The test instruments were validated with a Alpha Crombach analysis of the instruments which gave 74.6% as shown in table 1 below.

Table 2. Reliability of data collection instrument.

Reliability Statistics

Cronbach's Alpha	N of Items
.746	12

The sample of 114 SMEs made up of forty six (46) Small Scale Enterprises, thirty six (36) medium Scale and thirty two (32) Large Scale Enterprises were selected from the New Juabeng Municipality of Ghana. Accordingly, respondents were provided with checklist on common variables that affect SMEs growth. The concentration was to give the respondents an opportunity to express opinion on the checklist if the chosen variables have effect on the stages of SMEs growth. A 5- point Likert scale questionnaire was designed

after which it was administered to the selected respondents using the convenient sampling method. The Kaiser-Meyer-Oklin measure of sampling adequacy was 60.20% as shown in table 3 below.

Valid N (listwise)	114							

From the table 4 above, more than 80% of the respondents agree that all the variables chosen have significant impact on Small and Medium Scale Enterprises. 81.5% of the respondents agree that tax laws should be simplified enough for SMEs for understand with 18.5% of the respondents differing to the view whilst 75.5% of the respondents also agree that tax burden should be lighter to SMEs with 24.5% of the respondents are of other opinion. Again, 83.3% of the respondents also agree that tax rate should be rational and appropriate to SMEs whilst 81.6% of the respondents also agree that tax policies should favour SMEs to grow with 18.4% of the respondents differing. 91.2% of the respondents also agree that tax incentives and rebate should be given to SMEs with 8.8% of the respondents differing. 86.0% of the respondents agree that tax policies should encourage human capital training whilst 14% of the respondents are of different opinion. Also 83.3% of the respondents agree that tax put pressure on SMEs with 16.7% having a different view on the statement. All the respondents agree that double taxation and other factors are militating against the growth of SMEs whilst 86.0% of the respondents are also of the view that existing taxes laws in the system do not favour the growth of SMEs with 14% holding a different view. Out of the total respondents, 75.5% of them agree that taxes increase Government revenue whilst 24.5% of the respondents differ. 84.2% 0f the respondents also agree that poorly executed tax are disincentives to the taxpayer.

This finding agree with the work done by Ojeka (2011) who said tax system should friendly to survive the growth of SMEs. The findings also buttress that of Mungaya et al (2012), that higher production, distribution and selling costs lead to higher prices which eventually put SMEs out of business.

Kamar (2015) whose findings indicated that taxes have both positive and negative effect on SMEs therefore Governments should levy SMEs lower rate to ensure their survival.

Table 5: Showing the summary of model.

Model Summary

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	.329[a]	.108	.067	23.75322

a. Predictors: (Constant), Resource Maturity, Take-off, Success, Survival, Existence

From table 5 above, there is a low correlation coefficient of 32.9% between resource maturity, take-off, success, survival and existence on taxation. Although the correlation is low, taxation has an effect on SMEs development at all stages and it can cause the winding-up. With an R^2 of 10.8% means other factors not considered in the model constitute 89.2% on taxation.

From the table 6 above, the correlation between the first variable and the second variable was 0.389 and this was significant. Also the correlation between the third and first was 0.192 this was also significant whilst the correlation between the third and second variable was also 0.456 this was also significant at 0.000 and so on as seen from the table above.

Table 7: Showing the Anova distribution of the stages of SMEs growth.

ANOVA[b]

Model		Sum of Squares	df	Mean Square	F	Sig.
1	Regression	7388.714	5	1477.743	2.619	.028[a]
	Residual	60935.251	108	564.215		
	Total	68323.965	113			

a. Predictors: (Constant), Resource Maturity, Takeoff, Success, Survival, Existence

b. Dependent Variable: Taxation

From table 7 above, with a significance value of 0.028 means that taxation has a significance effect on SMEs stage of growth.

Table 8: Showing null hypothesis statement.

Hypothesis	Variables	Significance
H_o	There is significant relationship between tax and the SME's stages of growth.	Significant

From table 8 above, with a significance value of 0.028 means that resource maturity, take-off, success, survival and existence stage of SMEs development taxation has a significance effect on them.

Table 9: Coefficient figures showing various stages of SMEs growth.

Coefficients[a]

Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.
		B	Std. Error	Beta		
1	(Constant)	67.692	7.110		9.521	.000
	Existence	.639	1.072	.149	.596	.552
	Survival	2.849	1.207	.547	2.360	.020
	Success	3.082	1.034	.697	2.980	.004
	Takeoff	-3.160	1.166	-.608	-2.711	.008
	Resource Maturity	-3.708	1.349	-.818	-2.748	.007

a. Dependent Variable: Taxation

From table 9, Taxation = 6,769.2 + $63.9X_1$ + $284.9X_2$ +$308.2X_3$ – $316.0X_4$ – $370.8X_5$, means that taxation has 63.9% on existence, 284.9% on survival, 308.2% on success whiles take off and maturity would be depreciated by 316.0% and 370.8% respectively. This finding is also in line with the findings of Kamar (2015) who Said that taxes have both positive and negative effect on SMEs therefore Governments should levy SMEs lower rate to ensure their survival.

5.0 Conclusion

It is evidently clear that no nation can develop without Small and Medium Scale Enterprises because they are the main players of the private sector which serves as the engine for growth. It can be concluded that without friendly tax system SMEs cannot grow. Notwithstanding, taxes for SMEs should be lighter and should not be harmful because it their increase running costs and slow down growth. All the SMEs studied are saddled with the challenged tax rate that does not promote their growth. In other for these SMEs to grow, tax policy should not be a burden to them.

5.1 Recommendations

On the basis of the findings done, the researcher wish to make the following recommendations:

(i) Tax rate and tax laws for SMEs should be made clear to ensure easy compliance. This includes making the laws clear and simple. SMEs should not be made to go through rigorous and undemanding tax filing process. Tax authorities should incorporate information technology into their operations by entrepreneurs to pay their taxes through mobile money and with the clique of the button.

(ii) Tax administrators can create a database of all the SMEs in the country and a simple text message sent to them when it is time for them to honour their tax obligations. Tax authorities must avoid multiple taxes system on these SMEs for their survival and growth.

(iii) Moreover, tax authorities can improve their support services to SMEs such as making available to them exemptions when they honour their tax obligations.

ABSTRACT
Performance is an important factor in firm strategic analysis since it helps in measurement of the competitive position of an organization within industry. Most theoretical literature in strategic management describes performance as outcome of firm's strategic objectives, which are developed and executed at the

corporate level of management. The acquisition and utilization of strategic resources has been shown in various empirical studies as determinants to maximise performance. However, extant literature on the role of corporate strategies as driver in the utilization of these firm strategic resources towards superior performance has not been adequately examined. This is so especially in the developing economies, notably sub-Saharan Africa. This paper examines the effect of corporate strategies on performance of manufacturing firms in Nairobi City County, Kenya. The corporate strategies under study were market development, product development and diversification. The authors empirically examine the relationship using survey data from 148 manufacturing firms in Nairobi City County, Kenya. The study findings indicate that corporate strategies have a positive and significant impact on a firm's performance. This study has important implications for managers and policy makers of manufacturing firms on the need of developing and executing corporate strategies within their firms to enhance performance.

Keywords: ***Corporate strategies, firm performance, manufacturing firms, Nairobi City County***

INTRODUCTION

Manufacturing firms in Africa and especially the Su-Saharan Africa have been noted to be declining in performance. The World Bank report (2015) explained that in Africa, the manufacturing firms perform below capacity. It was also indicated in the African Development Bank report (AFDB, 2013) that the manufacturing firms in Africa account for small share of GDP which range from 3.8% to 11% compared to industrialized countries which range from 30% to 40%.In Kenya, the AFDB report (2013) indicated that the manufacturing firms have been declining in performance as a source of overall GDP growth. In similar view, the Kenya Strategic Policies for the 21stCentury report (2001) explained that the performance of manufacturing started to slowdown in the middle of 1980s.

According to Porter (2008); Kutllovci, Shala and Troni (2012) corporate strategies include the firm intention to maintain its current position; achieve high growth as compared to current achievements or aim at reducing its one or more business operations. Extant theoretical arguments in strategic management posit that firm resources and capabilities are important in determining the nature of strategies to use. Wheelen and Hunger (2008) contend that among the corporate strategies, market development, product development and diversification might be more applicable in an operating environment dominated by scarcity of resources as well as uncertainty of market and consumer behaviour. The context of this study is sub-Saharan Africa that is known to experience challenges in resource availability, distribution and prudent exploitation. The Government of Kenya National Industrialization Policy (2012) explained scarcity of resources and unstable market as key determinants of performance in manufacturing and identified market development, product development and diversification as the core strategies for growing manufacturing in Kenya.

In Kenya, the manufacturing firms are categorized into sub-sectors which are defined by the Kenya Association of Manufacturers based on what they produce. Eighty percent of the country's manufacturing firms tend to be concentrated in the capital city, Nairobi which is well networked with supportive infrastructure. The World Bank report (2015) explained that Kenya's manufacturing firms have the potential to generate higher GDP growth capable of supporting development initiatives. However, Kimuyu (2001) indicated that the firms output was successful in the first two decades following independence, but the performance declined gradually. The Kenya National Bureau of Statistics (KNBS) report (2016) showed that several manufacturing firms have continued to register decline in performance. Further, the KNBS report (2016) explained that manufacturing firms' performance have been at a slower pace with a

five years (2012-2016) aggregate growth rate of 3.84%, aggregate output 5.48% and aggregate contribution to GDP growth of 5.2%.

In the 2018-2022 economic development pillars, the government of Kenya has identified manufacturing, affordable housing, food security and universal health coverage as the four pillars to support socio-economic development. To this end, manufacturing firms are important to Kenya since they projected to contribute to the country's GDP through value addition to raw materials, foreign exchange earnings and offering employment. Therefore, the government of Kenya is expanding infrastructure and agricultural production, to support the manufacturing firms. There are other interventions of policy such as the Vision 2030 blueprint that has been developed to transform the country into an industrialized economy by the year 2030. Despite various government interventions, the trend of underperformance by manufacturing firms raise the concern of possible gaps in the strategies that are used by these manufacturing firms. This trend of underperformance suggests that other than infrastructure support and enhanced agricultural production, firms might require corporate strategies to predict and explain the established behaviour within their environments to remain competitive and enhance performance.

LITERATURE REVIEW

Theoretically, various authors advance different propositions of firm performance based on the theory adopted in describing performance. The Resource Based View (RBV) theory was adopted in this study to describe performance of manufacturing firms. The RBV of the firm suggests that the firm resources and core competencies fundamentally determine its strategies (Pearce & Robinson, 2007). According to Peteraf and Bergen (2003); Hodgson (2008) for a firm to arrive at a better determined corporate strategy, it is important to conceive its resources as capacities towards superior performance. On his part, Leiblein (2003) argued that the RBV contemplates how firm resources are allocated and deployed in corporate strategy. Therefore, firm corporate strategies can be established by focusing on integration of firm strategic resources and capabilities (Furrer, Thomas & Goussevskaia (2008).

In reviewing RBV and firm performance, Eisenhardt and Martin's (2000) argue that the purpose of corporate strategy is to manipulate strategic resources and core competencies into new configurations to acquire and sustain superior firm performance among industry competitors. Thus, as far as RBV is concerned, firms have to determine the correct corporate strategies based on strategic resources and core competencies, with the assumption that the future value of firm resource is asymmetrically distributed (Newbert, 2007; Lockett, Thompson & Morgenstern, 2009). In most strategic management studies, the concept of firm performance has been addressed based on the outcome of relationship between three broad factors such as firm strategies (Mazdeh, Moradi & Mazdeh, 2011); competitive advantage (Hosseini & Sheikh, 2012); and business environment (Tan & Liu, 2014).According to Pasanen (2003) performance is often described as outcome of firm's corporate strategies that are associated with long term financial and non-financial objectives. In measuring the firm financial performance, Yurdakul (2005); Samson and Ford (2000) explained that net profit and return on assets (ROA) are important indicators that might be considered. On the other hand, Hawawini, Subramanian and Verdin (2003) indicated that non-financial indicators of sales growth and customer retention might also be used in firm performance measurement.

In explaining the effect of corporate strategies on performance, several empirical studies have been conducted and findings documented. Kittichai and Phapruke (2010) showed that market development strategy impacted positively on performance of garment manufacturing industry in Thailand. Faria and Wellington (2005) found that market development strategy determined performance of firms in USA gaming industry. Yuan, Feng and Liu (2006) showed that market development strategy significantly affected performance of manufacturing firms in China. Isidre, Gunasekaranb and Begoña (2002) found that product development strategy significantly affected performance of manufacturing firms in Spain. Amue and Adiele (2012) showed that product development strategy significantly affected performance of electronic manufacturing firms in Nigeria. Kavale, Mugambi and Namusonge (2016) found that product development strategy significantly affected performance of Microfinance Institutions (MFIs) in Kenya.

A study by Iwona and Bielawska (2010) showed that diversification strategy had positive effect on manufacturing firms in Poland. Chia, Wen and Heng, (2008) found positive relationship between diversification strategy and performance of Taiwan manufacturing firms. Lee, Hall and Rutherford (2003) showed positive effect of diversification strategy on Korea manufacturing firms. Manufacturing firms listed in the Tunisian stock exchange were found to be positively affected by diversification strategy in a study by Ezzi and Jarboui (2015).

CONCEPTUAL FRAMEWORK FOR THE STUDY

The conceptual framework for measuring the effect of corporate strategies on performance is developed from the study theoretical and empirical reviews. The framework links the study independent variable which is corporate strategies indicated by market development, product development and diversification and the dependent variable which is firm performance indicated by non-financial parameters of customer retention and sales growth; and financial parameters of net profit and return on assets. This conceptualizes a direct relationship between corporate strategies and performance of manufacturing firms, as illustrated in Figure 1.

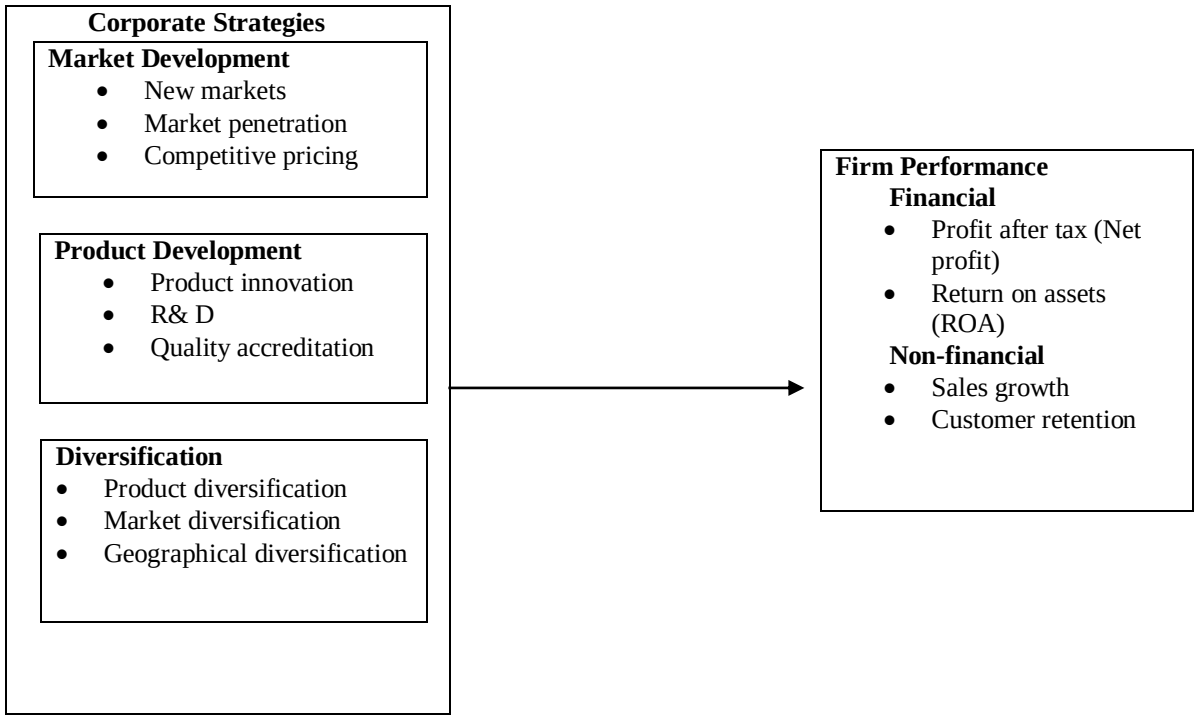

Figure 1: A Model linking Corporate Strategies and Performance of Manufacturing Firms

Whereas the corporate strategies of a firm are varied, there is a consensus among scholars of strategic management that corporate strategies are important determinants of firm performance. The corporate strategies intention is to direct the firm business towards the attainment of its long-term objectives, maintain its current position or achieve high performance as compared to current achievements (Porter, 2008; Kutllovci, Shala & Troni, 2012; Pearce & Robinson, 2013). Consequently, firms are expected to determine specific corporate strategies that are fit for purpose of enhancing superior performance. In addition, firm corporate strategies fail because they do not adequately analyse firm's strategic resources and capabilities before determining the right strategies in specific market conditions in which the firm operates. Therefore, this study proposes the following hypothesis:

H_{01} : Corporate strategies have no significant effect on performance of manufacturing firms in Nairobi City County, Kenya.

METHODOLOGY

The study adopted both descriptive and explanatory survey design as recommended by Sekaran and Bougie (2009). According to Njuguna, Munywoki and Kibera (2014) the descriptive and explanatory survey designs enable studies to test hypotheses quantitatively. Additionally, Saunders, Lewis and Thornhill (2009) explain the use of more than one design helps in the triangulation of research findings raising the validity of the findings towards optimal results. By using descriptive design, the researcher captured the characteristics of a population and tested hypotheses (Cooper & Schindler, 2003). According to Burns and Grove (2007) descriptive design is expected to help the researcher in gathering information regarding

variables in their natural situation. This design enabled the researcher to capture the study population's characteristics in their natural situation.

Kothari (2003) suggested that when a researcher intend to explain relationships between variables, then an explanatory study is more appropriate to use. According to Mugenda and Mugenda (2003) when there is an existing hypothesis on why certain situation is occurring, explanatory study is then conducted to test the hypothesis. This design helped the researcher to test study hypotheses. Zikmund (2003) explained that survey approach in research provides quick and accurate method of accessing study data, helping the researcher to establish whether there is significant relationship between variables within target population at specific point in time.

From the conceptual framework, firm performance is a function of composite variable corporate strategies whose components are market development, product development and diversification. Hence;

$$Y = \beta_0+\beta_1X_1+ \beta_2X_2+ \beta_3X_3+ \varepsilon$$

Where;
β_0= Constant (intercept)
β_1, β_2 and β_3= Beta coefficients of independent variable
X_1 = Market development strategy
X_2 =Product development strategy
X_3= Diversification strategy
ε = Error term

The population of this study was 373 manufacturing firms based in Nairobi City County, Kenya categorised as large by the Kenya Association of Manufacturers. The study determined the sample size by use of multi-stage sampling method as recommended by Shapiro, Carlson, Astin, and Freedman (2006).The steps of determining sample size was proportionate stratified sampling defined by sub- sector, and then a simple random sampling to select specific firms to participate in the study. A sample size of 189 firms was used in the current study which was arrived at using the formula suggested by Fisher, Laing and Stoeckel (1985) as follows:

$$n = \frac{Z^2\alpha/2\ pq}{d2} \qquad n = \frac{(1.96)2\ (0.50)\ (0.50)}{(0.05)2} = \mathbf{384}$$

$$n_f = \frac{N}{1+n/N} \qquad n_f = \frac{384}{1+(384/373)} = \mathbf{189}$$

Where:

n_f = is the desired sample size (when the population is less than 10,000).

N= the Population (in this case 373 firms).

n = the desired sample size (if the target population is greater than 10,000)

z = the degree of confidence (in this case 95% confidence interval, ά=1.96)

p = the proportion in the target population estimated to have characteristics being measured. 50% chosen as recommended by Fisher *et al*., (1985)

d = the level of statistical significance (set at 5%).

The study then stratified the sample size of 189 among different manufacturing sectors using proportionate sampling based on the population of each sector. The study obtained primary data from the chief executive officer/managing director or director of each selected firm by the use of a semi-structured questionnaire.

RESULTS AND DISCUSSION

The validity and reliability of the study measurements were assessed before survey data was analysed. The instrument was subjected to a panel of experts to determine the content validity. Confirmatory factor analysis (CFA) was used to investigate construct validity of the instrument as recommended by Patton (2002). The research instrument had adequate construct validity since all the items had Eigen values greater than 1.0 and loadings greater than 0.4 as recommended by Rahim and Magner (2005). A pilot study using 20 respondents who were part of the study population was done to test for reliability of research instrument. Cronbach's Alpha for all the variables were found to be above 0.7 threshhold, as recommended by Sekaran and Bougie (2009). The study targeted 189 large manufacturing firms where 41 were not responded to, while148 were properly filled and returned thus translating to a response rate of 78.30%.

Descriptive Analysis

Table 1: Firm Background Characteristics

Category	Sub-Category	Frequency	Percentage
Age of the firm(Years)	21-30	20	13.5
	41 to 50	86	57.8
	Above 50	22	28.7
	Total	**148**	**100**
Size of the firm (Assets Value)	Above Kshs. 100 Million	148	100
	Total	**148**	**100**

Source: Survey data (2018)

Based on research findings presented in Table 1, eighty six firms (57.8%) had been in existence for a period between 41 and 50 years, more than 50 years were twenty two (28.7%), twenty firms (13.5%) were found to have existed for a period between 21-30 years. The respondents indicated that all the manufacturing firms were large under classification by Kenya Association of Manufacturers (KAM). This finding was not unusual since according to KAM, large firms have been in existence for long period to achieve annual turnover of $100M, thus; more likely to sustain operations by dominating production and market shares, at the same time attracting investors for capital injection based on the perception that large firms are more profitable.

Table 2: Corporate Strategies

Variable	Mean	Standard Deviation
Market Development Strategy	3.67	1.04
Product Development Strategy	3.66	1.07
Diversification Strategy	3.59	1.08
Aggregate	**3.64**	**1.06**

Source: Survey data (2018)

The findings in Table 2 show that market development strategy was the most practised by the manufacturing firms with a mean of 3.67 and standard deviation of 1.04, followed by product development strategy with a mean of 3.66 and standard deviation of 1.07, and least used was diversification strategy at a mean of 3.59 and standard deviation of 1.08.

Diagnostic Tests

Several diagnostic tests were done before hypothesis testing. The Keiser-Meyer-Olkin (KMO) was used to measure sampling adequacy, which obtained values greater than 0.5 as recommended by Malhotra and Dash (2011). Confirmatory factor analysis which used communalities and Eigen values was used to test for variable correlations, obtaining values that exceeded 0.4 meaning that no variables were highly correlated as recommended by Rahim and Magna (2005). The study found that all variables met normality threshold of values between -0.1 and + 0.1 using Shapiro–Wilk test as recommended by Myoung (2008). The Pearson's correlation coefficients for all the independent variables were positive indicating positive linear relationship between individual independent variables and the dependent variable as recommended by Field (2009). There was no multicollinearity since tolerance values for all variables were above 0.10 and VIF values of below 10 as recommended by Field (2009). The test of homogeneity by use of Levene's test of homogeneity revealed the p-values for the three predictor variables were greater than the level of significance at .05 implying no homoscedasticity as recommended by Warner (2008).

Hypothesis Testing

The hypothesis that was tested stated that corporate strategies have no significant effect on performance of manufacturing firms in Nairobi City County, Kenya. The hypothesis was tested using regression model. Corporate strategies (predictor variable) were regressed against firm performance (dependent variable). To evaluate the effect of corporate strategies on performance, a model summary of the coefficient of determination was developed, and presented in Table 3.

Table 3 Model Summary

R	R Square	Adjusted R Square	Std. Error of the Estimate
.697	0.486	0.475	0.26397
Predictors: (Constant), Diversification Strategy, Product Development Strategy, Market Development Strategy			

Source: Survey data (2018)

Findings in Table 3 shows an adjusted R-square value of 0.475, which means that 47.5% of variation in firm performance can be explained by the three predictors that formed independent variable. The predictors were market development strategy, product development strategy and diversification strategy. The findings are consistent with the argument by Porter (2008) as well as the findings of a study by Kutllovci, Shala and Troni (2012) which indicated that corporate strategies positively influences firm performance. The findings for the ANOVA (Model fitness) are presented in Table 4.

Table 4 ANOVA Results

	Sum of Squares	**df**	**Mean Square**	**F**	**Sig.**
Regression	9.492	3	3.164	45.406	.000
Residual	10.034	144	0.07		
Total	19.526	147			
Dependent Variable: Performance					
Predictors: (Constant), Diversification Strategy, Product Development Strategy, Market Development Strategy					

Source: Survey data (2018)

The results in Table 4 on the amalgamated analysis of variance reveal an F statistic value of 45.406 which is significant at 5% level of significance (Sig = 0.000). The findings imply that the model linking corporate strategies to performance of manufacturing firms was of good fit and corporate strategies contribute significantly to changes in performance of manufacturing firms. These findings are consistent with the findings of a study by Monday, Akinola, Ologbenla and Aladeraji (2015) which showed that market development; product development and diversification strategies had significant effects on performance of Nigerian manufacturing firms. The findings for model coefficients are illustrated in Table 5.

Table 5 Regression Model Coefficients

	Unstandardized Coefficients		**Standardized Coefficients**		
	B	**Std. Error**	**Beta**	**T**	**Sig**
(Constant)	0.331	0.275		1.204	0.231
Market Development Strategy	0.345	0.057	0.403	6.08	0.000
Product Development Strategy	0.346	0.063	0.348	5.467	0.000
Market Diversification Strategy	0.172	0.063	0.188	2.723	0.007
Dependent Variable: Performance					

Source: Survey data (2018)

Performance of Manufacturing Firms = 0.331 + 0.345 (Market Development Strategy) + 0.346 (Product Development Strategy) + 0.172 (Market Diversification Strategy)

Table 5 indicate the regression model coefficients of each indicator of corporate strategies that was included in the study; that is market development strategy, product development strategy and diversification strategy. The findings show that market development strategy has a beta coefficient of 0.345 and a p-value of 0.000, which implies that it positively and significantly affects performance of the manufacturing firms. The findings imply that an increase in market development strategy by one unit leads to an increase in performance of manufacturing firms by 0.345 units. The results further imply that by focusing on market development strategy, manufacturing firms can achieve high performance. Based on these results, it can be concluded that manufacturing firms may determine their market depending on the particular segment's profitability and brand royalty among other factors. The findings are consistent with the findings of a study by Kittichai and Phapruke (2010) conducted on the relationship between market development and performance among garment industry in Thailand and established that market development impacted positively on firm performance in the garment industry in Thailand.

The findings further indicate that product development strategy has a beta coefficient of 0.346 and a p-value of 0.000 which implies that it positively and significantly affects performance of manufacturing

firms. These findings imply that an increase in product development strategy by one unit leads to an increase in performance of manufacturing firms by 0.346 units. The results further imply that product development strategy contribute to firm performance. This would benefit the firms in developing broad range of products to offer market choices to address customer preferences, and manufacturing unique products to cope with industry competition. The findings agree with the findings by Isidre, Gunasekaranb and Begoña (2002) on product development and firm performance in manufacturing companies located in Spain that established a positive relationship between product development and firm performance.

On evaluation of diversification strategy, the findings revealed a beta coefficient of 0.172 and a p-value of 0.007 which implies that it positively and significantly affects performance of manufacturing firms. The findings imply that an increase in market diversification strategy by one unit leads to an increase in performance of manufacturing firms by 0.172 units. Based on these results, it can be argued that manufacturing firm focus on diversification would lead to benefits such as exploitation of emerging market opportunities and acquiring new customers from competitors through market control. The findings are consistent with the findings of a study by Ezzi and Jarboui (2015) that diversification affect performance of manufacturing firms in Tunisia.

CONCLUSION AND POLICY IMPLICATION

The study established that the three indicators of corporate strategies were significantly correlated with performance of the manufacturing firms and had high explanatory power. Overall, corporate strategies were found to positively and significantly affect firm performance.Majority of the firms were found to have been in existence for more than 40 years. Based on this it can be concluded that patience and consistence in manufacturing sector is a key attribute, thus the young entrepreneurs venturing into manufacturing sector should learn to be patient with their businesses to give them time for growth and build capacity to cope with the changing environmental variables.

Based on findings of this study, it is reasonable to conclude that corporate strategies influence performance of manufacturing firms. The positive impact of market development, product development and diversification indicators significantly impact on the measures of firm performance, namely customer retention, volume of sales, net profit and return on assets. These findings lead to a conclusion that manufacturing firms' participation in corporate strategies development and execution enables them to achieve firm objectives resulting to superior performance.

The study contributes to empirical literature on effect of corporate strategies on firm performance. Specifically, the study found out that corporate strategies significantly affect performance of manufacturing firms in Nairobi City County, Kenya. Therefore, the study findings contributes to the knowledge of strategic management by providing empirical evidence on effect of corporate strategies on performance of manufacturing firms in the context of developing and less industrialized economies.

The study contributes to the theoretical literature by supporting the proposition of the Resource Based View of the Firm that the resource value and core competencies of the firm can be used to determine the corporate grand strategy that enhances performance of the firm. The study empirically established that just like the proposition of the theory, superior firm performance results from uniqueness of the firm competencies in the industry. Therefore, the study findings provide empirical literature to scholars that will form basis for the analyses of corporate strategies in the context of RBV.

Micro Savings For Entrepreneurial Financing

(An Empirical Review of Impediments Experienced By Women Entrepreneurs in Kenya).

Ambrose Jagongo, PhD, Kenyatta University - Kenya

Abstract

This study examined factors that affect savings mobilization for growth of women – owned MSEs. It was based on the socio - economic cognitive entrepreneurial predisposition, aimed at discerning the complexities between the women entrepreneurship potentials and environmental constraints to savings for growth of the MSEs. Savings mobilization is an apparent phenomenon in this study having been a proven alternative to MSEs financing methodology today. Many women – owned MSEs have received financial and other assistance from various donors to start their business, but their inability to reduce reliance on external sources to grow had remained unexplained. The study hypothesized that the main constraints to savings mobilization for growth of women owned MSEs arose from internal and external factors to the firm, the utilization of derived profits, and the characteristics of the woman entrepreneurs. The target population consisted of women entrepreneurs who had received assistance from the WEDCO project (3030), in Kisumu and Kakamega districts in Kenya region. The sample size was determined through a multistage sampling process which culminated into 300. Questionnaires, interviews and observations were used to collect primary data. Data analysis was done by use of Pearson coefficient of correlation, chi-square tests of independence, analysis of variance. The major findings of the study were that the number of dependants; education level; cultural and religious attachments; endowed management skills; age and marital status had a significant relationship with the savings propensity amongst the women entrepreneurs. It was also revealed that environmental factors such as level of market competition; number and quality of employees, pricing of supplies; proximity to banking facilities; accessibility to information; economic inflation and physical infrastructures bore significant weight on the women's ability to save for the growth of their enterprises. The legal and regulatory framework significantly impeded savings ability for growth of women entrepreneurial ventures. It was concluded that the aforementioned factors should be addressed. Business development services should be enhanced and the women entrepreneurial competencies be improved to inculcate a culture of business savings for financing the operations and growth of women enterprises.

Key words: ***Micro savings, entrepreneurial ventures, entrepreneurship competencies, Women - Entrepreneurial -behavior, Savings mobilization, women entrepreneurs.***

1.1 Background to the Study

Women have been initiating and starting their own businesses in unprecedented numbers in recent years. Some of them are leaving large corporations to "go it alone", for a number of career reasons: frustration at hitting the "glass ceiling", dissatisfaction with slow career advancements and unmet career expectations; corporate downsizing or to fulfill personal dreams of entrepreneurship of being autonomous and achieving success in business (Buttner and Holly 1998). Studies on SME development in Africa have cited the gender of an entrepreneur as an important factor in determining the enterprise's take-off, growth and performance (Downing 1990; Parker, 1994, Aboagye, 1986). At the same time, women entrepreneurs have been identified as a significant and growing part of Kenyan business community (Dondo, 1998). Recent data on sole proprietorships and family holdings in Kenya provide evidence of the recent trends in women's share of the SME segment of Kenya's business sector (Analytical Report on gender dimensions Vol. XI; Kenya Population and Housing census 1999). The report shows that women dominate the Kenyan population working on their own or family business holdings, where they form about 58% while less than 50% of the Kenyan male population work on family business holdings (GOK, 1989 & GOK, 1999). The trend show that women entrepreneurship have grown substantially, however this growth is not engineered by mobilized savings, but rather from credit financing (Dondo, 1998).

In Kenya however, women entrepreneurs face unique socio-economic obstacles in running their businesses to an extent that their enterprises are likely to perform poorer compared to those run by their male counterparts (Musinga, 1994). Granted this, women-run enterprises would tend to create fewer jobs and experience higher failure rate or retardation than men-run-ones due to management constraints. However, women owned enterprises employ more women than men, a trend positive to the Kenya's gender demographic statistics at present. This implies that women-owned enterprises posit greater opportunity to salvage the unemployment situation in Kenya towards poverty eradication, especially because women numbers and responsibilities are currently major subjects for attention if faster economic development is to be realized. As such, it is expected that women-owned enterprises should increase women employment more than men-owned enterprises (Musinga, 1994), hence the potential to create viable occupation for the ever increasing women population in Kenya (GOK, 999. Studies in entrepreneurship development have shown that a key way in reducing household poverty levels is to increase access of women to income-earning activities (employment) that is, to economically empower women (Musinga, 1994). This could be achieved through prudent savings mobilization for growth of women-owned enterprises, which would cause financial sustainability and business financial independence.

The government recognition of the role and importance of the MSEs in policy documents has gone through a number of stages as outlined in studies by King (1996), Gichira (1998) and McCormick (1988). The support of the Government of Kenya for this sector is evident in development plans and sessional papers, particularly Sessional Paper No. 1 (GoK 1986), Sessional paper No. 2 (GoK 1992) and Sessional paper no. 2 (GoK 1996a).

These documents acknowledge the increasing importance of the informal sector in economic development with respect to employment creation, particularly in the face of economic crisis and structural adjustment policies. They also show the government support to providing enabling policy environment by redressing licensing, tax, security of works and other regulatory restrictions on informal sector activities; stressed the role of private sector enterprises and initiatives, with the government playing mainly a facilitative role. The government also outlined the need for adequate access to credit, provision of management and technical training and other non-financial support programmes in business counseling, consulting, marketing and extension services. The cumulative effects of these strategies are to create an entrepreneurial culture in Kenya. Comparing MSEs in Kenya with those in other African countries, it was established that the MSE sector in Kenya has more signs of dynamism and maturity than in most other African countries (GEMINI 1993). The adoption of financial liberalization policy alone has not been sufficient to generate a strong response in terms of increased savings mobilization and intermediation through the financial system; neither has it created wider access to financial services or increased investment by the private sector. Fragmentation of the financial markets has largely impeded efficient resource mobilization and restricted financial intermediation (Dondo, 1999).

Women Economic Development Corporation (WEDCO) is one of the various intermediary financial institutions in Kenya that receives support from the Department for International Development (DFID) to support small business start-up, in an attempt to alleviate poverty in Kenya. Intervention strategy of DFID for the MSE sector is being implemented by the British Assistance to Small Enterprise programme (BASE). The goal of BASE is to reduce the incidence of poverty in Kenya by assisting to generate additional off-farm employment, especially among poor people, and enhance incomes through increased productive capacity. (International Centre for Economic Growth 2000).

1.2 Problem Statement

Sessional Paper No. 1 of 2005, on the Development of MSEs for Wealth and Employment Creation for Poverty Reduction (GoK 2005), states that lack of access to credit is still a major constraint inhibiting the growth of the MSE sector. The issues and problems limiting the MSE acquisition of financial services relate to lack of tangible security and limited access to formal finance. The structured mechanisms that

facilitate the flow of financial resources from the formal financial sector through the Micro Finance Institutions (MFIs) increases the cost of credit both to the entrepreneur and the financial institution. Mead (1989) argues that, savings mobilization is the second best alternative to credit financing because it is from savings that most investments in entrepreneurial ventures spring up. This indicates that prudent savings mobilization would offer long-term benefits to the entrepreneur and enhance enterprise development, yet savings mobilization does not thrive optimally in substance for entrepreneurship development.

According to Inziani, 2006, the question of who will successfully and adequately finance women MSEs has remained unanswered for too long, he postulates that a larger MSE financing gap has been created that has affected their operations, performance and realization of their full potential. Michael Klain, 2007, argues that SME banking is considered a high-margin business with strong potential for profitability, cross-selling and risk diversification opportunities for the banking sector at the expense of the entrepreneurs. The same study portents that equity finance is more ideal for young, high growth and potentially high risk enterprises, typical of those owned by women entrepreneurs. That equity capital can be raised from internally generated funds, saved for business growth prospects. The gouging enquiry is therefore "what constraints the women entrepreneurs from mobilizing savings to grow their MSEs?" Despite its importance, saving trends in Kenya have not been steady for the last two decades. Gross domestic savings (GDS) as a percentage of Gross Domestic Product (GDP) range between 3.6% and 24.9% with Growth Domestic Investment (GDI) being between 7.7% and 25.0%. In the last two decades, as shown in Appendix 5, GDS has been below GDI. This suggests in part that resources accumulated locally are inadequate for the country's investment needs. The external debt crisis of the 1990s coupled with the already widely acknowledged limitations of external donor financing (for example, tying of aids in various forms) emphasizes the need to increase domestic savings. Mayaka (2006) argues that women make good entrepreneurs because they are keen to plough back profits to boost their business, but most of them do not reach their business potential. Many women entrepreneurs, either individually or formed into business women groups receive financial and other assistance from various donors either as grants or loans to start or grow their enterprises, however, it has been observed that they continue to demand more assistance instead of mobilizing and re-investing the savings for their business growth and development (McCormic & Pedersen, 2001). It was against this background that this study sought to investigate constraints to savings mobilization for growth of women owned MSEs which had received assistance for start – up.

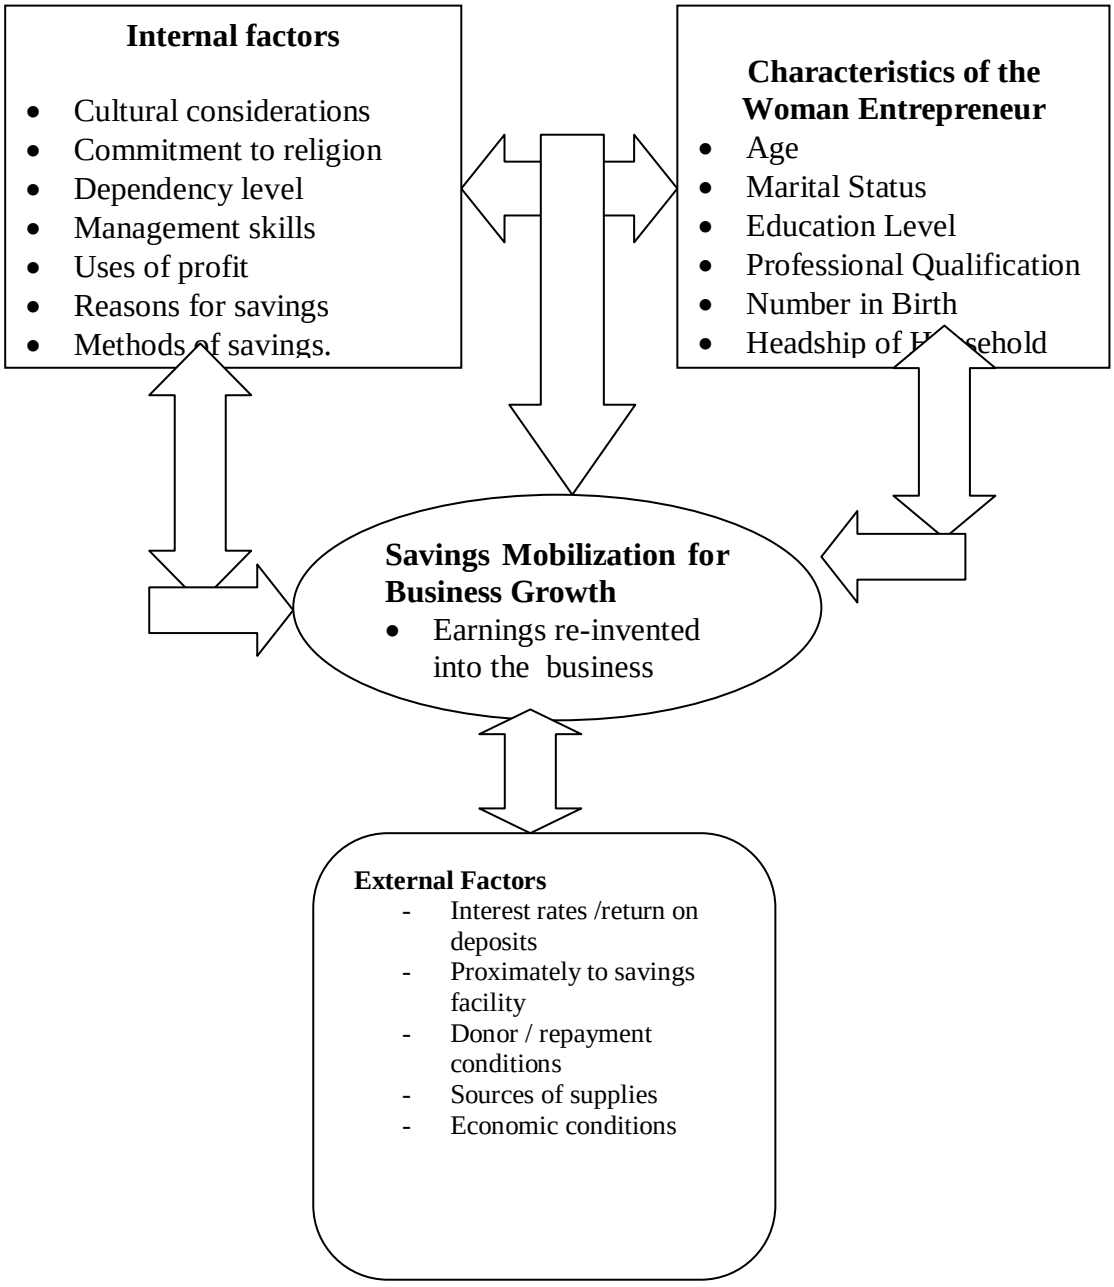
1.3 Objectives of the study

The general objective of this study was to examine the factors that affect savings mobilization for growth of women - owned enterprises, especially those that were assisted to start-up.

The study hypotheses were:

1. There is no significant relationship between Internal /external factors and savings mobilization for growth of women - owned MSEs.
2. There is no significant relationship between characteristics of women entrepreneurs and savings mobilization for growth of women - owned MSEs.

Figure 1: Conceptual Framework



1.4 Research Design

Descriptive survey of correlation design was employed in this study. The descriptive design was found to be suitable because it seeks to produce accurate profile of personal factors, events and situations, which were outlined in the conceptual framework of the study. The phenomenon is applicable to constraints to savings mobilization because the factors describe the women MSE operators' competencies and their business profiles. . Kilemi and Wamahiu (1995) postulate that descriptive survey produces data that is holistic, contextual, and rich in detail. However, in recognition of the fact that no single design exists in isolation, Saunders *et al.* (2003) postulate that combining different designs in one study enables triangulation and increases validity of the findings; for this reason, elements of exploratory design were applied. Correlational design was used to establish emerging causal relationship among the variables.

1.5 Target Population

The study population comprised 3,030 women in Kisumu and Kakamega districts in Western Kenya region who were operating MSEs after being assisted by WEDCO at start-up stage, operating either commercial/ trading business, service oriented business, light manufacturing or a combination of these categories.

Table 1 Target population / sampling frame

Sampling Frames	Target Population	Total Sample size	Sample Size	
			Kisumu	Kakamega
Commercial women MSEs	1480	109 (7.5%)	64	53
Service MSEs	1400	110 (7.9%)	63	62
Light manufacturing MSEs	110	52 (47.7%)	26	14
Combined commercial/ service	40	29 (69%)	7	11
Total	**3,030**	**300**	**160**	**140**

Source: WEDCO (2006)

1.6 Sampling

Through Multi - stage Sampling, a sample of 300 was drawn from the 3030 WEDCO project women participants with the assistance of the district project managers, women group leaders and the local administration. The sample size determination, for this study was based on the formula in Saunders *et al.,* (2003). The level of certainty of tolerance in any study is very important. This study, worked with 95 % of certainty level.

1.6.1 Sample selection

The sample selection commenced with the criteria for participation in the study, which is membership to WEDCO project. To participate, the women entrepreneur must have been assisted by WEDCO either to start or to grow the business. Secondly only those operated on own account and not being operated by the woman as an employee were considered for the study. The individual elements for this study were selected from the sampling frames using probability sampling. The use of different sampling methods was based on the different sampling frames in the study. Simple random sampling was used as the basic sampling design for selecting individual elements from a sampling frame. It consists of selecting a group of ***n*** sampling units in such a way that each sample of size ***n*** has the same chance of being selected.

Questionnaires

Self-administered semi-structured questionnaires were used to produce the required data. The instrument was chosen because of its credit for flexibility in asking probing questions not beyond the focus of the study (Hoepfl 1997).

Interviews

This was the data collection technique involving oral questioning of selected persons who were deemed to have information concerning the study. An in-depth interview was held with the WEDCO project managers and the women group leaders.

Focus group discussions

The purpose of focus group discussions was to obtain in-depth information on concepts, perceptions and ideas of the women groups on as aspects of entrepreneurship generally and savings mobilization in particular. Participants were drawn from homogenous settings and a total of 10 and 9 women participants from the two districts participated in the discussion.

Observations

This was a technique involving systematic selection, watching and recording behavior and characteristics of the women entrepreneurs at their business premises, and doing the same to stock levels and movement, visible assets, business records and the general establishment of the businesses. It was done through non-participant observations, i.e., the observer watched the situation and took note of the observed phenomena.

Observations in this survey served the following purposes:

- Offered additional, more accurate information on certain aspects of the study than the interviews and the questionnaires.
- It equally acted as a check on information collected as well as supplementing verbal statements made by respondents. Observations equally assisted in validating and strengthening quality of the data gathered. Some of the observed aspects of entrepreneurship included; time management, resource allocations, workers supervision, storage, business set up, facilities and display, record keeping, treatment of customers, stocks, participation of the owners and visits by government / local authority agents.

1.7 Data Analysis

The coded data was subjected to descriptive statistical analysis, which included deriving frequency distribution, measures of central tendency (mean, and standard deviation) to test for normality; and the Chi-square test (χ^2) of independence was utilized to check the existing association between categorical data. Inferential statistical analysis, using the ANOVA and correlation analysis ware performed to examine the relationships between the internal factors and savings mobilization pattern of the women entrepreneurs and to establish the extent to which the derived profit was used for business growth and to determine the extent to which the government policy supports saving mobilization.

2.0 FINDINGS, DISCUSSION AND INTERPRETATION

2.1 Response Rate

The study yielded a response rate of 76.7%. This high response rate was attributed to the excellent introduction done by WEDCO staff, the training and good service rendered by the research assistants and the use of structured questionnaire. It also reflected the high expectations, which the respondents harboured, that their challenges and problems could be solved through such entrepreneurship research.

2.2 Profile of Women Entrepreneurs

Internal factors were hypothesized as among the factors that affect savings amongst women owned or managed businesses. To analyze the internal factors, a profile of the women who participated in the study was generated. Information about their social-demographic variables of age, ethnicity, religion, birth order, marital status, level of education, commitment to ethnic cultures, household membership dependency level, headship of the household, number of children and dependants in school and colleges, parents' business background, husband's business background (for those who were married), commitment of husbands and parents to religion and to ethnic cultures, and professional qualifications were produced.

Table 2:1: Distribution of respondents based on bio-demographics/ Charateristics

Variable	**Category**	***Frequency*** **N=230**	**Valid Percent**
Age of respondent	Below 16yrs	2	.9
	16 -32yrs	68	30.1
	33 -55yrs	140	**61.9**
	Over 55yrs	16	7.1
Number in birth	**1st born**	94	**41.2**
	2nd born	52	22.8
	3rd born	32	14.0
	Last born	34	14.9
	Others	16	7.0
Marital status	Single	18	7.9
	Married	**162**	**71.1**
	Divorced	8	3.5
	Widow	40	17.5
Commitment to ethnic cultures and beliefs (**by self**)	Not committed	54	23.9
	Fairly committed	128	56.6
	Very committed	36	15.9
	Extremely committed	8	3.5

Source: Survey data (2006)

The results in table 2.1 are consistent with the findings of Hirsrich *et. al.*, (2002), which showed that enterprise career progression, began between the ages 22 and 45 years, and that 30 years was the prime age to initiate enterprise start-up. The Pearson correlation coefficient between age and performance variables, had significant positive relationship, with number of full-time employees at the time of the study ($r=0.007, p<0.01$, profit first quarter ($r=0.016$, $p<0.05$) profit second quarter($r=0.003$, $p<0.05$), profit third quarter ($r=0.038$, $p<0.05$) and capital at the time of study ($r=0.007$, $p<0.01$). These findings imply that as the age of the woman entrepreneur advanced, a resultant positive change in the performance and growth variables occurred. This could mean that with the advancement in age of the woman entrepreneur, the capacity to improve the business performance increased. The Pearson correlation coefficient between age and the savings mobilized ($r=0.003$, $p<0.05$), also depicted a positive significant relationship which implies that as the age of the woman entrepreneur advanced, a resultant positive change in the perception about savings mobilization for growth of the enterprise occurred.

Number in Birth and Marital status

As shown in Table 4.1, many of the respondents were either first born or second born.

First born comprised 41% (n=94), second born 22% (n=52), third born 14% (n=32) last born 14.9% (n=34) and where number of births were more than four comprised 7% (n=16). With regard to marital status, Table 4.1 shows that the majority of the women studied were married (n=162, 71.1%) followed by widows 17.5% (n=40), those who were still single comprised 7.9% (n=18), divorced or separated accounted for 3.5% (n=8).

Table 2:2: Distribution of respondents based on level of commitment to ethnic cultures and beliefs

Variable	**Category**	***Frequency*** *n=230*	**Valid Percent**
Commitment to ethnic cultures and beliefs (**By self**)	Not committed	54	23.9
	Fairly committed	**128**	**56.6**
	Very committed	36	15.9
	Extremely committed	8	3.5
Husbands commitment to ethnic cultures	Not committed	42	21.9
	Fairly committed	**100**	**52.1**
	Very committed	42	21.9
	Extremely committed	8	4.2
Parents' commitment to ethnic cultures	Not committed	42	18.6
	Fairly committed	**90**	**39.8**
	Very committed	76	33.6
	Extremely committed	18	8.0

Source: Survey data (2006)

As shown in Table 2.2, only 23.9% of the respondents indicated that they were not commitment to their ethnic cultures and beliefs. A majority (74.8%) were found to be committed to various degrees to their ethnic cultures. Among those who were married, only 21.9% revealed that their husbands were not committed to cultural values. A total majority of 75.3% indicated that their husbands were committed to their ethnic cultures while 2.6% did not indicate. On the parents' commitment to ethnic cultures, 18.6% indicated that their parents were not committed. Majority, (79.9%) said that their parents were committed while 1.7% did not indicate their parents' commitment to ethnic cultures. This implies that ethnic cultures were a very important factor that could not be ignored in women entrepreneurship development. Chi-square test of independence between tribe/ethnicity and rate of parents' commitment to ethnic cultures show a significant relation at 0.05 level between the variables (χ^2 =25.084 p=0.003).

Level of Education and Professional Qualification

The results indicated that majority of the respondents had attained secondary levels (55.4%), With regard to professional skills, 76.5% possessed no professional qualification. For the women entrepreneurs in the sample, who were married, the majority of their husbands had secondary level of education 63.1% and no higher professional skills 40.4%. This study compared very well with the national baseline survey (1999) which noted that participants in the formal sector with primary level of education were 54%, while those with secondary level were 33%. These results of this study however show that the women entrepreneurs' without any formal education had reduced while those with secondary level had increased as compared with the national baseline survey (1999). The picture was confirmed by a nonparametric correlation (Table 2.3**)** which showed Spearman's (***r = -0.184)*** indicating that there was very high significant correlation at 0.01 level between highest level of education of the women in entrepreneurs and level of commitment to ethnic cultures and beliefs. This implies that the higher the levels of education attained, the less committed the individuals to ethnic cultures and beliefs.

Table 2.3: Nonparametric correlations between level of education and commitment to ethnic cultures & beliefs

			Highest level of education by self	How committed to ethnic cultures and beliefs
Spearman's rho	Highest level of education by self	Correlation Coefficient	1.000	-.184(**)
		N	224	222
	How committed to ethnic cultures and beliefs	Correlation Coefficient	**-.184(**)**	1.000
		N	222	226

Source: Survey data (2006) ** Correlation is significant at the 0.01 level (2-tailed).

The relationship between the woman entrepreneurs' education level and the savings mobilization was analyzed by Pearson's correlation coefficient. The results show that there was no statistical significant relationship ($p>0.05$). This implies that woman entrepreneurs' education level may not have much impact on savings mobilization.

Household Headship

Of the total respondents, 64.5% (n=142) indicated that their husbands headed their households. A paltry 35% (n=78) said they were the heads of their households. This implies that the majority of the women entrepreneurs were controlled by their husbands, a situation that could influence the uses of business generated funds in general and savings mobilization in particular and delay entrepreneurial decision-making for instance, on business growth prospects. This supports the Poverty Reduction Strategy for 2000-2003 which reports that since female-headed households constitute significant proportions of the poor, any intervention must be gender sensitive, to enable women entrepreneurs to make a significant contribution to

economic development and industrialization (GoK, 1986). The findings are also in agreement with Hornaday and Aboud (1971) who reveal that support, independence and leadership in households, women groups or other forums are other personality traits that make women to be successful entrepreneurs.

Household Size and Level of Dependants

The respondents were asked to state the total number of their household members. Of the total respondents, 53% (n=116) indicated 2-6 members, 28.4% (n=62) indicated 7-10 members, 7.3% (n=12) said their households comprised themselves and their husbands; another 5.2% (n=12) provided that their household members were well above 10. The respondents were also requested to state the number of dependants they take care of and the results were: 56 % take care of 1-5 dependants, 20.0% take care of 6-10 dependants, 19.2 % take care of no dependant at all while 5.5 % had more than 10 dependants. A cross tabulation of highest level of education and number of own children revealed that all (100%) of respondents with no formal education had 6-10 children, 66.7% of those with primary level had 1-5, 87.7% of those with secondary had 1-5 while 60% of those with higher than secondary had 1-5 children. The relationship between the level of education and the number of own children was such that those with no formal education had significantly high number of children, (χ^2 = 27.817, df = 6, $p < 0.5$).

Commitment to Religion Activities

95.5% were committed to their religion personally, 91.6% had husbands who were committed while 95.0% had parents who were committed to religion.

Involvement and Participation in Religious Activities

Variable	**Category**	**Valid Percent**
Being a religious leader	**Not important**	**59.0**
	Slightly important	21.9
	Very important	17.1
	Extremely important	1.9
Attending all religious services	Not important	21.7
	Slightly important	21.7
	Very important	**40.6**
	Extremely important	**16.0**

Attending only crucial religious activities	Not important	33.0
	Slightly important	19.4
	Very important	38.8
	Extremely important	8.7
Giving donations	Not important	9.2
	Slightly important	22.9
	Very important	**52.3**
	Extremely important	**15.6**
Giving tithe as required	Not important	16.3
	Slightly important	20.2
	Very important	**41.3**
	Extremely important	**22.1**

Being a Religious Leader

The respondents were asked how they viewed or rate importance of their involvement and participation in religious activities. 59% (n=124) said being religious leader was not important to them, 21.9% (n=46) found religious leadership very important while only 1.9% (n=4) considered it extremely important.

Attending all religious activities

Attending all religious services was stated to be crucial by 78.3%, out of whom 40.6% said it is very important to them, 21.7% found it slightly important and 16% found it extremely important. On the other hand, 21.7% said it was not important to attend all religious services.

Attending only Crucial Religious Activities

Majority (67%) of the respondents said that participating in crucial religious activities was important, while 33% indicated that it was necessary for them to attend over crucial religious activities only.

Giving of Tithe as Required

The majority 83.7% of the respondents consider giving of the tithe as required necessary. Out of this, 41.3% said it was very important, 22.1% found it extremely necessary and 20.2% ranked giving of the required tithe as slightly important. This implies that a reasonable percentage of the earnings of women entrepreneurs were set aside for tithe.

McClellan and Hagen (1962) that Psychological and social factors such as personality influence entrepreneurship. It implies that entrepreneurship behavior among the women may result from attitudes, which in turn are affected by social environment including parental attachment, weight of husband's opinion, involvement in religious activities and cultural attachments.)

Household Membership and Level of Dependency

The results indicate that 53.2 %($n = 116$) had between 2 and 6 members in their households, 28.4% (n=62) had between 7-10 members, 12.8% (n=28) comprised households with the women only or the woman and her husband only.

Number of Dependants other than Own Children

56.6% of the respondents indicated that they had between 1and 5 dependants, 20.2% had 6-10 dependants, 19.2% had no dependants, while 4% had over 10 dependants to take care of.

Correlation between Profit and Major Items of Expenditure

Correlation analyses between profits from the business and major items of expenditure show both positive and negative associations. Very high significant positive correlation at 0.01levels was found between distribution of disposable income on school fees and profits for all the quarters of the year. Significant positive association at 0.05 level was revealed between expenditures on rent, salaries and wages and the whole year's profits. There was insignificant relationship between loan repayments and the year's profits. However interestingly, there was a significant negative correlation at 0.05 level between savings and the quarters' profits, while only a negative picture of association was revealed between expenditure on personal effects and the profits.

Chi-square Tests and Correlations between External Factors and Savings

Several external factors were tested against the savings, to determine interdependence and effect for growth prospects. The findings revealed as follows:

Accessibility to Credit and Savings Mobilization

To establish the relationship between savings mobilization and external factors, chi square tests and correlation analysis were conducted. The results revealed that 8.5 % of those who did not access credit easily saved nothing; 46.2% of this category saved between up to 25% of their income while 54.8% saved between 26 to 50%. Accessibility to credit has direct and proportionate negative impact on savings

mobilization. As shown in Table 4.21, there is a very significant association with a negative relationship between accessibility to credit and savings mobilization, with those who accessed credit easily saving less (χ^2 = 2755 and r = -0.248). This implies that as accessibility to credit increased, the propensity to saving reduced, among women entrepreneurs. Those who were able to access more credit easily saved very little.

Competition and Savings Mobilization

Findings indicated that 35.1% of those who experienced stiff completion saved nothing, 28.8% of this category saved between 1 to 25%, 16.1% saved between 26 to 50%, 15% saved between 51 to 75% while 5% saved between 75%. There is a significant negative relationship between market competition and savings mobilization, with those who experienced less completion saving more (χ^2 = 34.081 and **r = -** 0.142), as shown in Table 4.22 This implies that businesses that experienced more advanced completion for their products saved less.

Inflation Rate and Savings Mobilization

The findings revealed that 86.65% of the respondents, who indicated that they were affected by economic inflation rate, saved nothing from their income. Another 33.35% of this category saved between 1 to 25%, 23.35% saved between 26 to 50% while only 3.8% saved over 50%. There is a significant negative association between economic inflation rate and savings mobilization, with those who indicated they are affected more, saving less (χ^2 = 26.68 and r = -0.191), as shown in Table 4.22.

Prevailing Political Situation and Savings Mobilization

There was very high significant relationship between changes on prevailing political situations and savings mobilization at (χ^2 = 16.454 and *r = 0.*232) as shown in Table 4.22. This implies that changes in political situations affected the savings behaviour of the women entrepreneurs.

Table 2.5: Correlation analysis between external factors and savings mobilization.

	P	.023

(*) Significant at 0.05level (**) Significant at 0.001 level

Source: Survey data (2006)

The correlation analyses between external factors and savings mobilization are largely negative as presented in Table 22. Accessibility to credit though negatively related to savings is found to be very significant at *(r= -0.248, p=0.001).* Economic inflation rate and effect of government agents are also negatively related to savings but are significant at *(r= -0.191, p=0.011* and *-0.167, p=0.023* respectively.) while nature of completion is negatively related to savings and moderately significant at *(r= -0.142, p=0.055).* There is a very high correlation between the prevailing political situation and savings *(r= 0.232, p=0.002).* There is however no significant relationship between access to market for produce and savings. This shows that the external factors largely portrayed negative implications to the progression of entrepreneurial activities in general and to savings for growth among women entrepreneurs in particular.

Books of Accounts and Profit Determination

Of all those who responded, only 8.3% indicated that they always kept proper books of accounts, 20% said they apply this skill sometimes, 10.2% said they hardly kept books of accounts while 61.1% indicated they that they never kept proper records of accounts. Similarly, 76% of the respondents said that they did not calculate profits properly; 8.6% said that they sometimes derived their profits accurately while only 1.9% indicated that they used proper methods always.

Interest Rates on Savings

To determine the effect of interest rates on savings among women entrepreneurs, the respondents were required to indicate the interest rate in their savings facilities and to state whether the rate affected their decisions on savings. The results provided that there was no significant relationship between interest rates and the decision to save (χ^2 = 60.533, df=22 P= 00). The relationship between savings to earn interest and the profits for all four quarters of the year was found to be insignificant. (First quarter: χ^2 = 29.592, df=9 P= 001, second quarter: χ^2 = 16.827, df=9 P= 001, third quarter: χ^2 = 32.406, df=12 P= 001 fourth quarter: χ^2 = 28.197, df =12 P= 005).

Conclusions

This study dealt with socio-demographic factors, economic, household and personal characteristics, and the relationship between these internal factors with the savings mobilization among the women entrepreneurs. The study showed varied findings, on the variable relationships. Ethnicity, level of education and professional qualifications (by self or husband); marital status, age and birth order were consistent with the existing literature. However, commitments to religion and to culture (by self or husband or parents), level of dependants, childhood orientation and family business background had been scantly covered in the literature hence this study provided exploratory findings.

Women entrepreneurs were found to suffer three most common but irresistible situations:

- they govern large/ extended households and
- are committed to religious activities and
- are committed ethnic cultures.

In addition, those who were married have to submit to their husbands command in cultural and religious beliefs. Further, the findings of this study show that a number of social-cultural factors influence women entrepreneurship as a whole and business dynamics resulting in their growth or decline thus the birth, expansion, contraction, and death of women-owned SMEs are grossly affected by internal factors of firm revolving around the women entrepreneurs competencies. The main factors that contributed to the women-owned enterprises start-up were found to be; first lack of employment, lack of capital and lack of support and information.

This conclusion is supported by the results in chapter four. Other motivating factors for women owned enterprises start-up, *revealed during focus group discussions and interview*, were: trying out a skill first, the best alternative to earning a living, need to control own life and personal fulfillment in that order. Most of the women respondents were self motivated at start-up stages of their enterprise but were overwhelmed to grow or graduate their businesses owing to the large domestic chores and responsibilities arising from both economical and socio-cultural burdens and challenges.

Most of the women entrepreneurs never received any training, relied on their savings for additional sources of capital, and experienced low levels of satisfaction. Frustration and need to control own life was also indicated as reasons for mobilizing savings. The study recommends for:

(i) Strategies to enhance savings mobilization be put in place and institutions must recognize the uniqueness of the women competencies so as to offer relevant encouragement and support.

(ii) Institutional arrangements in the informal credit market such as Cooperative Societies, the Rotating Savings and Credit Associations (ROSCAS) be encouraged for the women entrepreneurs. These would continue to serve as a vehicle for pooling small savings.

(iii) Family household sizes and dependency levels must be addressed in order to put the women entrepreneurs in the category of active savers. The regulatory agencies in general and the government in particular should move in with goodwill to assist in this issue. For family household reduction initiatives to succeed, the beneficiaries must be empowered and made to contribute to the wealth of the economy through their involvement in viable businesses or trade.

(iv) Sensitization and awareness programmes should be enhanced to expose the women entrepreneurs to conducive financial environment that engenders greater competition. This will facilitate the introduction of new savings products for women in business that could enhance the mobilization of resources for development.

(v) Voluntary savings, involuntary savings and policy induced savings should be encouraged to generate increased output to deal with the situation of less than full employment which currently exists among women entrepreneurs. With the same breath, the importance of savings in Kenya as a developing economy should be addressed through attempts to bridging the resource gap to enhance savings culture amongst the women entrepreneurs.

(vi) Savings can be harnessed from the women through innovative products that meet their needs. At the same time, there should be extensive network of bank branches in the country, without a biased concentration in the urban centers, since proximity to banking facility was raised as an important factor for saving. This can be achieved through enhanced financial intermediation.

Empirical test of shareholder monitoring hypothesis at Nairobi Securities Exchange

Anthony M. Mugambi

Abstract

This study wishes to contribute to theory of finance by examining the applicability of large shareholder monitoring hypothesis at Nairobi securities exchanges. It is widely noted that most of finance theory and literature is based on empirical studies in developed countries, but the business context in developing and developed countries is disparagingly different and this paper presents an opportune moment for examining the applicability of one of the emerging topics in the literature of finance, the theory of ownership concentration. This study begins by exploring the theoretical framework on shareholder monitoring beginning with the landmark paper by Jensen and Meckling (1976) and Shliefer and Vishny (1986), Ownership concentration and firm value relationships have been subject of ongoing research. Lopez and Rodriguez (2012) have observed that previous studies examining ownership concentration and firm value have emphasized the significance of shareholder concentration, capital structure and dividend policy as corporate control mechanisms that influence value creation in a firm. This study is supported by Agency theory (Jensen & Meckling, 1976); large shareholder monitoring hypothesis (Shleifer & Vishny, 1986; 1997; Morck, Shliefer &Vishny, 1988; Demsetz & Lehn 1985); Pecking order hypothesis (Myers, 1984); Signalling hypothesis (Ross, 1977; Linter, 1956). the underlying theoretical literature in this field contend

that value is created or destroyed through agency costs (Jensen & Meckling, 1976). This study used longitudinal research design and data for the study was for the period (2008-2017) the target population is sixty six companies trading securities at NSE for the period ended in 2017. Empirical results reveal that at NSE large shareholder at Nairobi Securities Exchange could be entrenched and may not monitor the firm for the benefit of all shareholders more, but jointly with dividend payment, debt financing and firm size the results are significantly different. The findings of this study have significant policy implication to regulators and investors to policy makers, large shareholders in listed firms may not protect the interest of minority shareholders and over 40% of listed firms have not provided shareholder information in their financial statements as required by regulation, investors at NSE should understand the identity of major shareholders before making investments.

Emerging Issues In Banks Preference To Lending Government At The Expense Of Private Sector Credit Rationalization

Beatrice Nyokabi Wanjiru

beatricenkurruna@gmail.com

Abstract

With the emerging trends in banks preferring to lend government institutions at the expense of private sector, access to credit services has become a nightmare to private led institutions not only limiting them to sustainable growth but also crowding them out of the market. Financial institutions play an integral role in bridging the gap in the provision of financial services and fostering economic growth. In Kenya, changes in the interest rate capping, hard economic conditions, high public debt and changes in the global market policies have led credit rationing and mopping out private investments. It is widely acknowledged that private sector significantly contributes to employment and economic growth that accounts to over 60%. Nevertheless, the sector faces greater financing obstacles and credit constrained despite the presence of fully developed financial sector. In addition, the nexus of domestic bank lending to the government is gaining momentum with treasury recording Ksh.625billion from banks in the financial year of 2017 – 2018 as recorded by Kenya Bankers Association. This is mainly triggered by the government debt appetite, lucrative offer and risk free pricing. Evidently, banks are the primary source of credit to private sector and domestic government debt in Kenya. The goal to have a balance in the provision of credit to private sector and government is very important in promoting sustainability and achieving vision 2030. Crowding out private sector credit by public economic activity becomes a multidimensional concept that has little been presented. The study findings study findings indicated that there is a positive correlation between lending government and growth, there is negative association between growth and loan repayment offer.

Keywords: ***Banks preference to lending government, private sector credit rationalization, government debt appetite, lucrative offer and risk free pricing***

1. Introduction

Provision of adequate and customized credit services to the private sector wing is one of the imminent building blocks for a competitive and sustainable platform of private investment growth in the developing nations (Checherita & Rother, 2010). Global sustainable development calls for the streamlining of the financial system and review of policies that will make the financial institutions be accountable when it comes to giving priority to the private sector that contributes a lot to the economic growth and development of emerging markets in developing economies (Putunoi & Mutuku, 2013). Throughout, strong saving culture, supportive government policies and amble business investment climate will lead to risk ramification and high growth level in the private sector. a concerted effort must be directed towards the financial sector liberalization that calls for review of prevailing interest rate, entry deregulations, removal of credit allocation, review of government borrowing and credit allocation.

The main role of the government is to best serve the interest of her people in matters to do with policy formulation and implementation for growth and sustainable development in social, economic, political and cultural setup (Coccia, 2017). Every nation in its regional block has its own challenges and opportunities in policy support for the private sector development with the balance to public debt. Eberhardt and Presbitero (2015) presented a study on public debt and economic growth using a meta-analysis of developing nations, their study revealed how public expenditure and more so domestic borrowing from financial institutions has been ever increasing for the last decade. This has led to the spiral effect to the private sector on how high government debt accumulation from domestic market has negatively impacted on the private investment debt. The cycles and nature of government debt accumulation from the banking sector has led to debt overhung in some states with the government unable to service back thus threatening internal and external private investments (Borensztein, 2018). The crowding out effect of the private sector investments is automated due to the banks preference to servicing credit to the government without the consideration of the role of the private sector to the economic growth.

Traditionally; commercial banks, credit unions and cooperative societies have provided the bulk of credit services to the private sector with view of very profitable returns but unrelenting macroeconomic instability of their operations in developing world.

In Kenya, the private sector and mostly the small and medium scale enterprises are very constrained when it comes to access to credit services. This is in line with the capping of the interest rate that received mixed reactions from the policy makers and the Central Bank of Kenya when it comes to effect in 2016. Mostly, interest rate capping has a positive correlation to the economic development in conformance to the classical economic theory. Money supply, Central Bank monetary policy, inflation and time period are primary determinants of interest charged in the economy and dictates on the investment level and capital infrastructure that may be underutilized (KBA, 2018). Banks are courting government in providing their credit services in an environment that is risk free returns with astronomical profits. This neglects the private sector with dwindling returns and unsupportive business environment.

There is need to have policies to strengthen the infrastructures that supports financial empowerment to independent owned investments.

Statement of the Problem

Evidently, government borrowing from the financial institutions is necessitated by the need to bridge the infrastructural need and met the budgetary allocation in its expenditure. It has a positive effect on the growth of the economy in the short run and with the mixed implications in the long run coupled with changes in the governance regime. Excessive borrowing is bad to the economy in the it leds to crowding out of the private investments and constraints arises a result of capital shortages.

In a study presented Peter (2013) on analysis of domestic debt implication for economic growth in Nigeria showed that domestic debt has a significant and direct relationship to the GDP and debt servicing has inverse relationship to the GDP. This curtails the economy in the private investments that are the main contributors to the economic growth are capital constrained. This negatively impacts on their sustainability and competitiveness.

A report published by Kenya Bankers Association in (2018) on the influence of bank lending to the government on private sector credit through a fiscal deficit specification indicated that in the financial year 2017 – 2018 the banking sector had advanced government by lending Ksh. 625 billion. Contrary there was a decrease in the credit facilities apportioned to the private sector in the same year. It is in this need that the research study intends to fill the gap by exploring on the emerging issues in banks preference to lending government at the expense of private sector credit rationalization.

1.3 Specific objectives of the study

This is mainly triggered by the government debt appetite, lucrative offer and risk free pricing.

i. To establish the effect of government debt appetite on private sector credit rationalization

ii. To determine how lucrative offer in interest by government influences on the private sector credit rationalization

iii. To analyze how risk free pricing by government impacts on the private sector credit rationalization.

Literature

There is a number of past research studies that have been presented on the aspects of increased government borrowing and economic development. Accumulation of capital plays a critical role in the economic development and in instances where capital is deficient there is likely of decline in the growth. This is linked to failure to raise investments levels as a result of deficient in savings. Increased government appetite for borrowing at the expense of private sector is making financial institutions to advance most of their loans to the government with neglect of the majority of the private investors who are key drivers in the economic growth. In a study presented by Putunoi and

Mutuku (2013) on the implications of domestic debt on economic growth in Kenya. The study examined data collected from the year 2000 to 2010 using Augmented Dickey Fuller Test (ADF). The result of the analysis indicated that debt expansion for a period of study within the ten year had a positive and significant impact to the economic growth. The study recommended that government must consider having a sustainable strategy when it comes to domestic borrowing only provided that the funds are utilized very well.

Lending advanced by commercial banks to the government inform of bonds, bills are said to be risk free with lucrative returns. This makes the financial institutions to have a free will to lend the government more as compared to the private sector. Though it seems rosy to the banks and the expense of the majority who are in the private sector are credit constrained. Similarly, a study presented by Panizza and Presbitero (2014) to examine on the impact of domestic debt repayment and economic growth in Organization for Economic Co-corporation and Development countries (OECD). The study adopted a sampling approach in the analysis which was consistent with the literature, the study findings indicated that there was a negative correlation between the domestic debt interest repayment and economic growth with no causal effect to justify on the policy in the economy.

Methodology

This outlined on the research procedures when conducting fieldwork on data to explain on the research design, study population, research instruments, data analysis and presentations. The study incorporated an empirical approach for the secondary research and collection of data. Mugenda (2012) defined research design as a planned structure of investigations on the study objectives that enables the researcher to present a summarized analysis of the data in a meaningful way. The main aim of the research is to handle a challenge by presenting a thought out plan to describe on the information needed to make a statement on a policy. The research design adopted was descriptive with a key emphasis on the longitudinal reflection of history of events with regard to domestic borrowing.

The study population is defined as the set of events, people, households or elements under investigation that are deemed to have related characteristics in occurrence (Zikmund, Babin, Carr & Graffin, 2010). The study will incorporate domestic borrowing, GDP and private investments obtained from the Kenya National Bureau of Statistics (KNBS) from 1990 – 2017. The choice of the time duration was cultivated by the need to consider many of the economic and policy occurrences ranging from the IMF sanctions, political violence, changes in government regime, banking policies, interest rate capping, credit rationalization in the private sector and diminishing agents of donors.

The study adopted a time series secondary data that was extracted from different bodies including the World Bank, Central Bank of Kenya and Kenya National Bureau of Statistics. The data was based on the yearly computation of the growth rate represented by the GDP, the government borrowing from the financial institutions termed as the domestic debt, the lucrative offer in the repayment of the domestic debt represented by the interest rate on internal debt that is risk free return in pricing. This was shown in the table below in an operational of variables framework.

Table 3.3 Operationalization of variables

Variable	**Notation**	**Type**	**Measurement**	**Expected effect**
Gross Domestic Product	GDP	Dependent variable	Real GDP per annum GDP = C+I+G+ (X-M)	positive
Domestic debt	DD	Independent variable	Government borrowing from financial institutions and individuals Short term internal debt and long term internal debt	Positive
Domestic interest	DI	Independent variable	Government payment with interest on borrowing from the domestic market that is short term and long term Annual rates on short term internal debt and annual rates on long term internal debt	negative

C = Consumptions, I = Investments, G = Government spending, M = imports, X = exports

Data analysis defines the process of creating a system with a working structure with mathematical information collected (Cooper & Schindler, 2013). The data was optained from the secondary sources on the causal effect of the variables and presented in time series.

In conclusion, the study findings recommend that the Kenyan government should strictly go for manageable domestic borrowing from the government without infringing the private sector development. Going for excessive domestic borrowing from the financial institutions is advisable for meeting the development agenda and should not be relied on as it brings inflation and crowding out of private investments. The borrowing form the financial

institutions is repaid back with an interest, there is need to have a proper mechanisms of loan repayment done within the shortest time possible and with limits to avoid debt overhung.

Global warming on Capital Growth through Retained Earnings in the Manufacturing Industry

Benard Ouma Ogutu

Abstract

Corporate managers in the manufacturing industry often have capital growth as one of their goals. These leaders explore various means of attaining this motive and retained earnings being an avenue among others. Such a source of financing takes one to offer quality products to the market and convert the potential buyers to customers that eventually sustain the company's operations. Moreover, the firms have to keep the expenses at minimal levels to guarantee profits. Trained and experienced business managers have no problem handling these tasks except for the eminent challenges like seasonal sales. Notably, organizations also put focus on controlling or avoiding the factors that hinder profitability and eventually capital growth. However, most of them fail to take cognition of global warming that has in the recent past become an ecological talk by environmentalists. This phenomenon is described as the gradual increase in the earth's temperature. Today, the environmental technocrats have ventured into investigating the immediate effects of this phenomenon, but with minimal focus to capital growth through profitability. This research explores the existing literature to illustrate the impact of global warming on capital growth through retained earnings.

Key Words: ***Global warming, environment, business, capital, retained earnings, and finance***

Global warming on Capital Growth through Retained Earnings in the Manufacturing Industry

Introduction

The operations of top company managers typically aim at the maximization of shareholders' wealth as the ultimate goal (Yan, 2018). This target is synonymous to the concept of capital growth that implies the increase in value of a firm's net assets or investments over time (Becker Professional Education, 2017). Notably, the businesses require funds to initiate capital growth at any time. Financing sources for the corporate organizations towards undertaking further investment and eventually realizing capital growth might comprise long-term borrowings, issuance of

securities, and retained profits among others. Focusing on retained earnings, a firm has to ensure that it makes sufficient revenues to cater for all the operating expenses and earn profits for the initiation of capital growth. Therefore, the ability to make profits is subject to how a business attracts sales as well as minimizes the expenses (Gandhi, 2018). Nevertheless, outside forces like consumers' purchasing behaviour, competition, and government regulations among others have often presented a challenge for the corporate managers to contend with.

Today, global warming (GW) presents another impediment to profitability. Probably, various firms have encountered problems that could relate to this phenomenon, but they have unconsciously failed to correlate them. For instance, most corporations have failed to appreciate how the gradual increase in the earth's temperature has hindered the production of agricultural raw materials (U.S. Global Change Research Program, 2019). The few that have consciously associated the two might have also failed to undertake any corrective measures to averting the situation except the strategies to minimize the effects on business performance. This research aims at informing the manufacturing companies how global warming has hindered their capital growth through retained profits. Evidently, global warming is a phenomenon that has substantially hampered the ability of the manufacturing firms to make sufficient profits for capital growth.

Evidence of Global Warming

The concerned environmental authorities started to take note of global warming in the early 20th century given the continued rise in air and ocean temperature. They investigated and associated it with the emission of greenhouse gasses that include carbon dioxide, methane, and nitrous oxide among others. These emissions were majorly attributed to the industrial production, though with some human settlement activities. Currently, the global mean surface temperature is estimated to be 0.75 degrees Celsius from the -0.4 that it was in early 20th century (NASA 2019). NASA further notes that two thirds of the increase occurred after 1975 and estimates it to reach 1.5 degrees Celsius if the current rate of rising persists. The continues industrialization has caused a lot of worries and lately there has been a call to initiate ways of preventing global warming as it could reach a point where there is no solution except the earth to feel the full effect.

The existence of global warming has been noted in various regions across the globe. For instance, United Nations Environmental Programme (UNEP) has associated the currently changing weather patterns and drying of water

sources to global warming (UNEP, 2019). Some of the activities leading to this situation include deforestation like has been witnessed in the Mau Forest. The emissions of industrial gases has further caused the varying weather patterns in Kenya and even made it difficult for the Kenyan meteorological department to have clear prediction of future weather. An instance was the prediction of El Niño that failed to occur in 2014 (Care, 2016).

Another evidence of global warming is the Haiti Tsunami in 2010 that caused excessive flooding in the coastal region of the country leaving more than 200,000 dead (Luhnow & Dugan, 2010). This event was associated by the melting glacier due to the constantly rising temperature, thus, causing the rise in sea level.

Relationship between Retained Earnings and Capital Growth

Retained earnings normally present a financing source for capital growth. Various manufacturing firms are cautious about borrowing funds when they can obtain from within and this leads to devising mechanisms of retaining much of the profits (Agarwal, 2013). They claim that borrowings are expensive given that they have to repay with interests that are also subject to changes due to inflation. Therefore, such organizations would opt to limit dividends so as to create additional funds for investing. They also exercise adequate management of expenses to maximize profitability. Some of the notable cases include East African Cables and Bamburi Cement companies, both listed in the Kenyan Stock Exchange Market. These firms have consistently made profits, paid dividends, and at the same time retained much of the profits to initiate capital growth. Some like Monster Beverage Corporation, listed in New York Stock Exchange has even failed to pay dividends just to maximize retained earnings for capital growth. Nevertheless, global warming plays a role in hindering their profit potential, thereby, negatively impacting on capital growth.

Effects of Global Warming on Profitability

The unpredictable availability of raw materials due to worsening weather conditions has made some manufacturing firms to keep substantial amounts of money in the commercial banks without reinvesting to help take care of emergencies (Johnson, 2013). For instance, it is possible to run short of supply for the agricultural products from the regular suppliers, thereby, forcing the companies to spend additional funds seeking for such items from other markets (Folk, 2018). Otherwise, those that attempt to invest the surplus cash do so through short-term investments

that cannot help achieve the potential capital growth. The passive investment might include high-yield savings account, money markets, and in treasury bills that guarantee quick conversion to cash.

The ever impending flooding at the coastal regions like the one witnessed in Haiti in 2010 also has the potential of disrupting operations and causing damage to property. In such cases, the affected businesses often have to halt operations and spend surplus cash or even take loans, apart from insurance, that also hinder profitability to replace the destroyed plant (Care, 2016). Typically, such organizations end up not realizing any targeted expansion of production capacity, thus, making it hard grow capital using retained earnings.

The governments through the environmental authorities have also enforced contributing towards compensating for the pollution caused to the environment through emissions of greenhouse gases (Folk, 2018). In such cases, the businesses earn reduced profits that eventually hinder the capital growth potential through retained earnings.

The manufacturing firms that require usage of water have also been affected by the reduced availability of water. Such organizations then have to spend extra money that would otherwise be reinvested to grow capital in obtaining water from far off places (The Economist, 2019). Moreover, they might be forced to spend additional funds towards recycling of their used water.

Firms have also resorted to spending additional funds in environmental sustainability efforts to help attract customers instead of directly investing in capital growth (Schiano, 2018). Lately, there is a trend of consumers wanting to only buy from organizations that show efforts towards environmental sustainability such as production of environmental friendly products and participating on regular CSR activities towards taking care of the environment. This trend is evident from the research done by Love Energy Savings, a global consumer insight company which revealed that 55% of global consumers across 60 countries are willing to pay extra for the commodities and services that are committed to environmentally friendly policies (Love Energy Savings, 2019).

The increasing insurance costs due to increased risks associated with global warming such as destruction of property through flooding and transit of raw materials from far off places has further hindered the availability of retained earnings for capital growth (Schiano, 2018). An instance was in Kenya in 2014 when insurance companies increased their premiums to cover for the imminent damages through El Nino which even failed to occur.

Abstract
The study sought to establish the relationship between employee's welfare initiatives and job stability of catering employees in selected universities within the Nairobi City County, Kenya. It also established the relationship between employee's welfare initiatives and job stability of university catering employees in selected universities in Nairobi City County, Kenya. The study was descriptive covering a stratified sample of 189 respondents drawn from 300 employees. Data was collected through self-administered questionnaires and an interview guide questions. The two tailed Pearson product moment correlation was used and interpreted as follows; 0.010 to 0.041 implied, insignificant relationships; 0.041 to 0.70 implied, a moderate relationship; while> 0.70 implied a significant positive relationship. Meanwhile, a negative value implied an inverse relationship. 189 questionnaires were distributed, out of which 152 questionnaires were received from the respondents. This represented a response rate of 80.42%. The findings indicated that, majority of the respondents (61.2%) were female while the minority (38.8%) were males. Majority (22.4%) aged between 40-44 years while the minority (1.3%). aged <20 years of age. The two tailed Pearson product moment correlation results revealed that, there is a strong positive relationship between welfare initiatives; sporting facilities (0.768), housing, (0.890), recreational facilities (0.651) and job stability. According to the findings of the study, there is a significant positive relationship between the welfare initiatives; paid holidays (0.701), leave policy (0.195), staff uniforms (0.142), pension policy (2.76), long service grants (0.879), meals allowance (0.771), canteen facilities, (0.178), sufficient number of toilets (0.971) with job stability of university catering employees. However, there is a moderate significant positive relationship between restrooms (0.562) and job stability.

Key Words; ***Welfare Initiatives, Job Stability, Welfare Programs, Fringe Benefits, Employee's Assistance Programs, Employees' Benefits, Social Exchange***.

Introduction

Every employee requires and wishes for a secure job (Abdullah and Ramay, 2012). The life of any organization is dependent on the proper functioning of employees (Amirnejad and Asploor, 2016). Employees feel secured when the organization, values their colleagues and their welfare. Employees are interested in and believe in an organization that provides well-being, comfort and safety (Amirnejad et al, 2016). According to the study, employee's welfare contributes to the preservation and the improvement of the workforce. Such welfare includes; credit, health and insurance, transportation, housing, cultural sports, tourism and allowances. According to (Beheshtifar and Mojtaba, 2013), in (Brunneto, 2013), when the organization treats employees well, they reciprocate with hard work. Khademi (2014) stated that, welfare initiatives ensure employees happiness and job security. According to (Ndila, 2010) University employees are not satisfied with fringe benefits offered and would prefer a revision of the same. A study by (Amirtha and Prinicatta, 2015), found out that, the second to majority of the respondents (32%)%) were not satisfied with welfare initiatives provided at the engeneering colleges in Anna university of Tirunelveli Region. According to(Njeru, Moguche and Mutea, 2017), employees welfare initiatives are not regulary revised.

Background

When the organization treats employees well, they reciprocate with hard work (Beheshtifar and Mojtaba, 2013), cited in (Brunneto, 2013). Organizational support towards employee's welfare is a strong predictor of employee's turnover intention (Hussain and Asif, 2012). Employee's welfare programs retain and improve employees conditions (Keitany, 2014). According to (Wambui, 2017), welfare initiatives includes; employee's assistance programs such as health programs, counselling, physical fitness programs and the presence of financial arrangements. Employee's welfare initiatives have not fully succeeded in their quest to tie the existing staff to their current organizations as they are often designed without enough thought being given on how to secure employees commitment and connection to work as measured by the amount of the discretionary effort they are willing to expend on behalf of the employer. Workers tend to stay in organizations where fringe benefits are higher (Omonijo, Oludayo, Eche, Uche, Ohunakin, 2015). According to the study, management policies relating to poor fringe benefits and lack of rewards may have an adverse effect on employees voluntarily turnover. This affects their job stability especially in work environments where employees feel undervalued or ignored, or where they feel helpless or unimportant. According to (Azam, 2012), non-cash facilities attract and retain high skilled employees. According to the study by (Shefali and Shikha, 2017), employees welfare activities assist the employees to develop a sense of belonging towards organization as well as the feeling of safety.

Employees Welfare Initiatives and Job Stability

Employees are interested in and believe in an organization that provides well-being, comfort and safety (Amirnejad et al, 2016). According to the study, employee's welfare contributes to the preservation and the improvement of the workforce. A study by (Hussain and Asif, 2012), found out that, organizational support towards employees welfare is a strong predictor of employees turnover intention. According to (Keitany, 2014) employee's welfare programs retain and improve employee's conditions. Omonijo, Oludayo, Eche, Uche, Ohunakin (2015) asserts that, t workers tend to stay in organizations where fringe benefits are higher. The study further demostrated that, management policies relating to poor fringe benefits and lack of rewards may have an adverse effect on employees voluntarily turnover. This affects their job stability especially in work environments where employees feel undervalued or ignored, or where they feel helpless or unimportant. This is an indication that, welfare initiatives related with job stability. The Tehran University study by (Azam, 2012) found out that, there is a statically significant relationship between workplace and employees satisfaction with non-cash facilities. This is a clear demonstration that, non-cash facilities and job stability goes hand in hand in a successful organization, which he explained as those, able to attract and retain high skilled employees.

Statement of the Problem

Most staff members were dissatisfied with the level of welfare facilities (transportation, medical, vacation) provided to them and to their families (Saji, Tarek, and Mohammad, I.T., 2013). Further, it's vital to establish their relationship with job stability. The current welfare initiatives are inadequate as demostrated by (Ngaruiya, Nyandega, Origa and Ondundo, 2015) who stated that, "one of the challenges brought by massification of universities is inadequate staff welfare and inadequate staffs". According to (Ravindra, 2013), welfare initiatives are meant for middle and top management and not the 'worker levels', he stated that, " in india, organizations offer benefits such as; holiday homes, festival bashes, birthday treats, picnics, company watches, awards, flexible hours and vacation trips to middle and top management levels with the conditions at worker levels being different". This is a clear indication that, the available initiatives do not adrees the real needs of employees as demostrated by

(Ananthi, Narmatha, Murukesh and Periasamy, 2016) study which stated that, "employee's welfare services should satisfy the real needs of employees and they should be determined with the active participation of all the workers".

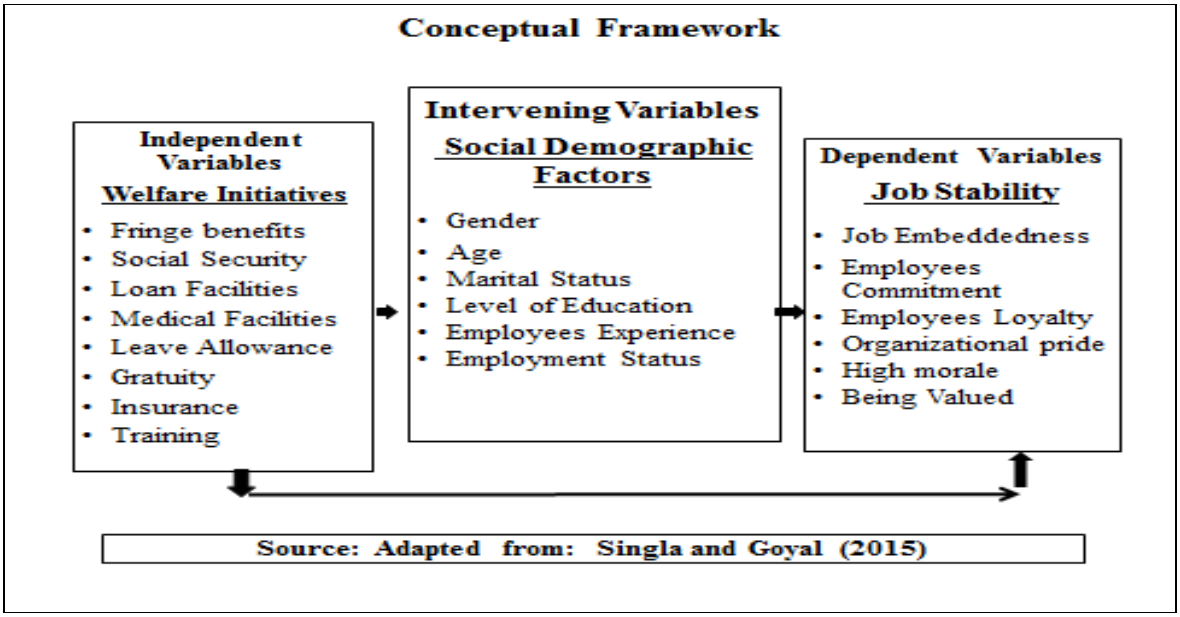
Research Hypotheses

$H0_1$: there is no significant relationship between employee's welfare initiatives and job stability of university catering employees in Nairobi City County, Kenya

$H1_1$: there is a significant relationship between employee's welfare initiatives and job stability of university catering employees in Nairobi City County, Kenya.

The Conceptual Frame Work

The conceptual frame work shows the relationship between the independent variables (welfare initiatives) and the dependant variable (Job Stability) of university catering employees.



Welfare Initiatives and Job Stability

A study by (Hussain and Asif, 2012), found out that, organizational support towards employees welfare is a strong predictor of employees turnover intention. According to (Keitany, 2014) employee's welfare programs retain and improve employee's conditions. The Tehran University study by (Azam, 2012) on the level of employee's satisfaction with the availability of welfare facilities among the staff working in the headquarters of Tehran University of medical sciences established that, there is a statically significant relationship between workplace and employees satisfaction with non-cash facilities. This is a clear demonstration that, non-cash facilities and job stability goes hand in hand in a successful organization, which he explained as those, able to attract and retain high skilled employees. Azem and Quddus (2014) studied the job satisfaction among the non-teaching employees of Central Universities in India, Hyderabad (University of Hyderabad and Maulana Azad National Urdu University). The findings ranked welfare measures as position one, out of the fourteen factors of the study in Maulana Azad National Urdu University and fourth, out of fourteen in the University of Hyderabad. This affirms the relationship between employee's welfare initiatives and job stability. The study demonstrated that, such welfare initiatives as; creches, construction of working women's hostels on the campus, incentive for working long hours and on holidays, reimbursement of medical bills and the reimbursement of tuition fees are welfare measures that leds to employees job satisfaction, and hence job stability. Omonijo, Oludayo, Eche, Uche, Ohunakin (2015) noted that, workers tend to stay in organizations where fringe benefits are higher. In their study on 'intentional turnover of administrative staff in a private faith-based higher institution in South-West Nigeria', they noted that employers deny workers these fringe benefits making them more vulnerable to voluntarily turnover. The study further demonstrated that, management policies relating to poor fringe benefits and lack of rewards may have an adverse effect on employees voluntarily turnover. This affects their job stability especially in work environments where employees feel undervalued or ignored, or where they feel helpless or unimportant. Wambui et al, (2017) studied the effects of work

life balances on employee's performance of Kabarak University in Nakuru County, Kenya. The findings laid emphasis on the importance of employee's assistance programs such as health programs, counselling, physical fitness programs and the presence of financial arrangements. The relationship between these welfare initiatives and job stability is clearly indicated by the responses of the study. For instance, when the employees were asked whether health programs helps them to contribute highly to their work, 39.7 % and 33.3% respectively strongly agreed and agreed compared to 12.7% who disagreed. It is also clear that, 68.3% either agreed or strongly agreed that health programs improved their attendance rates.

Social Exchange Theory.

Social exchange theory provides an insight on how a breach of the psychological contract may lead to a negative reaction. It explains the reciprocal relationship between the employees and the employer (Baran, Shanock and Miller, 2012). This view suggests that, when an employer provides an employee with fair treatment, they will perceive high levels of support from the organization and as a result feel obligated to reciprocate (Shoss, Eisenberger, Restubog and Zgenczyk, 2013). According to (Tran and Nazir, 2016), "employees enter in a relationship with the employer to get the maximum benefits". The exchange of emotional benefits and mutual trust is said to be initiated by the organization when they choose to implement employees benefits (Gould-Williams, 2007). Saji, Tarek and Mohammad, (2013), stated that, "employees will be more satisfied if they get what they expected". According to (Umar and Kabiru, 2015), when one party fails, frustration and anger sets in, but when all parts are fulfilled, trust prevails (Fieldman and Ng, 2008). From the social exchange theory, fair treatment of employees by the employer forces them to reciprocate positively by creating a mutual trust. When employees receive welfare initiatives, it can then be said to be a fair treatment to them. According to (Miao, Newman, Sun and Xu, 2013), the parties to a social exchange, reciprocate the action of one another, thereby creating a mutual obligation between them. According to Lavelle, Rupp and Brockener (2007) there is an exchange of social emotional benefits and mutual trust between the employer and the employees.

Summary of the Literature Review and the Research Gap

According to (Akeke, Akeke and Awolusi, 2015), "affective commitiment is the tendacy of an employee to remain in an organization due to his emotional attachment and strong identification with objectives and the mission of an organization". The study failed to demonstrate how employers can increase emotional attachment and identification with objectives and mission of an organization by deploying welfare initiatives particularly in university's catering departments. According to(Njeru, Moguche and Mutea, 2017), employees welfare initiatives are not regulary revised.the same sentiment was shared by (Ndila, 2010). However, the studies failed to demostrate how they can be revised and after a what period of time. Rawat and Chaubey (2016) demostrated that, maintaining the quality of human inputs rises from proper organization and administration of welfare facilities. The study failed to demonstrate how organizations particularly the universities can effectively organize and administrate welfare initiatives by categorizing them into different job categories. According to (Gould-Williams, 2007), the exchange of emotional benefits and mutual trust is said to be initiated by the organization when they choose to implement employee's benefits. This study paints a picture that, implementation of employees' benefits is a choice for the employer; this is absolutely not true as some welfare initiatives are obligated by the law. Moreover, it is for the benefit of both the employer and the employee. According to (Umar and Kabiru, 2015), when one party fails, frustration and anger sets in, but when all parts are fulfilled, trust prevails (Fieldman and Ng, 2008).

METHODOLOGY

The research study used the descriptive research design to find out welfare initiatives used in universities and their roles on job stability. The design has quanitative and qualitative approach methods which established welfare initiatives and their roles on job stability of catering employees working in universities in Nairobi City County, Kenya. The study was carried out in catering departments of 5 out of 46 university campuses in Nairobi City County Kenya (Commision for the University Education, July, 2016). The target population comprised of 300 university catering employees within the area of the study. The population was heterogenous, thus stratified sampling was done in selecting the respondents of the study and simple random sampling was used to select university campuses of the study.

Table 1.1 Summary of Sampling Technique

Technique	Area applied	Justification

Simple Random Sampling	University Campuses	Equal chance of being selected to represent the sample
Stratified Sampling	Respondents of the Study	Equal representation of catering employees working in university catering departments

Sample Size
A total of 189 respondents partcipated in the study as shown on summary distribution of the respondents according to three subsets of the study.

Table 1.2 Sample Size

Participants	**Population**		**Sample Size**
University Catering Employees	300	63%	189
Total	**300**		189

The sample size of university catering employees was determined using Israel's (1992) sample size calculation formulae as shown;

Figure 1.1 Sample Size Calculation Formulae

Equation 1: $\mathbf{n = \frac{N}{1+N(e)2}}$

Where :
N = population
e = precision rate at 5% (0.05)
n = sample size

Data Collection Instruments
The study used both primary and secondary data collection methods to collect data. Primary data was collected by means of self-administered questionnaires and an interview guide. Secondary data was collected from journals, annual reports, websites and publications.

Pretesting
All the instruments of data collection were pretested in one university not included in the actual study findings. The pre-test assisted the researcher to ensure clarity of items in the instrument of study. It also aided the researcher to identify the similarity of meanings, and the actual time needed to administer the actual data collection process.

Instruments Validity and Reliability
The instruments of this study were questionnaires and interview guide questions which were validated by the use of content analysis. Content analysis was done by cross-checking responses against the study objectives, hypotheses and against the conceptual framework. The content validity of questionnaires was ensured through consultation with the supervisors. Test-re test method was used to establish the reliability of the questionnaires. A cronbach alpha was used to test the consistency of variables. A cronbach alpha test results were interpreted according to (Gliem, 2003), who stated that, the closer the cronbach alpha coefficient is to 1.0, the higher the internal consistency of the study variables. The same is supported by (Brotherton, 2012) study which stated that, a reliable scale should have an alpha value of at least 0.7, or higher. The results of pretest were analyzed to identify the errors. The results of the individual welfare initiatives were between 0.800 to 0.822, meaning, the data collection instruments were reliable as they were higher than 0.7 as suggested by (Brotherton, 2012).

Data analysis technique
Quantitative and qualitative data analysis techniques were used in the study as the data collected were both numerical and narrative.

Analysis of data

For analysis and interpretation of data inferential statistics (two tailed Pearson product moment correlation coefficient) was used to establish the relationship between employee's commitment and job stability. It also established the relationship between employee's welfare initiatives and job stability of university catering employees in Nairobi City County, Kenya.

Table 1.3: Analysis of Hypotheses

Objective	Analysis Method	Justification
H02: there is no significant relationship between employee's welfare initiatives and job stability of university catering employees in Nairobi City County, Kenya.	Chi-Square	Determine the relationship between the study variables.
H12: there is a significant relationship between employee's welfare initiatives and job stability of university catering employees in Nairobi City County, Kenya		

RESULTS AND DISCUSSIONS

Introduction

This section represents the analysis, findings and discussions of the study. The main objective was to establish the relationship between welfare initiatives and job stability of university catering employees in Nairobi City County, Kenya.

Response Rate

A high response rate was obtained; this reduced the chances of getting biased statistics. As such, the findings were reliable as shown on the figure below;

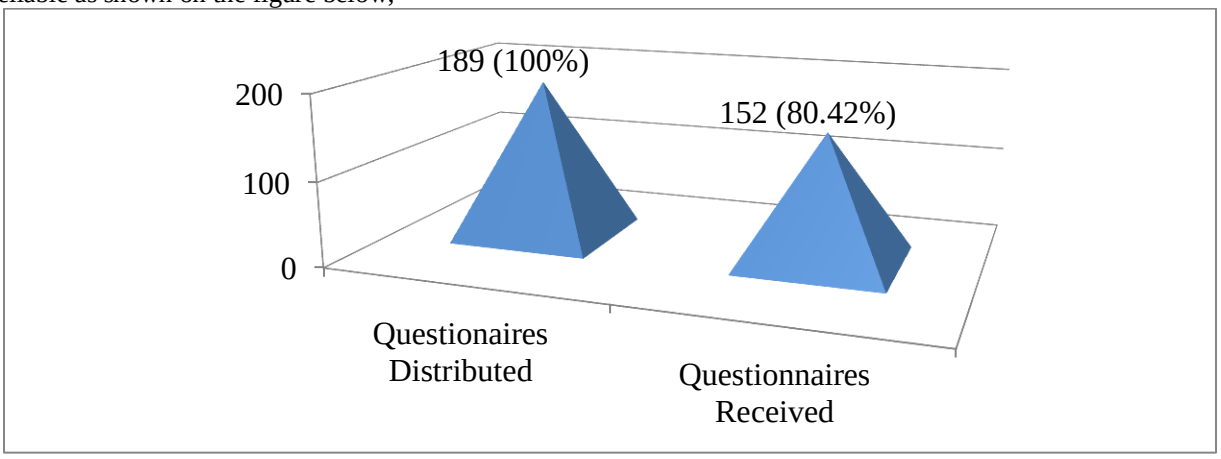


Figure 1.2: Response Rate

A response rate of 80.42% was obtained; this is adequate for analysis, as it conforms to to Mugenda and Mugenda, 1999 (as cited in Keitany, 2014, p. 30) that "a response rate of 70% and over is excellent" for analysis and conclusions. A non-response rate of 19.58% of university catering employee's questionnaires was due to time constraints especially at the meal times.

Demographic Characteristics of the respondents

The study sought employee's demographics and the findings were presented as shown

ISBN 978-9966-132-53-6 @ Copy Right .2019

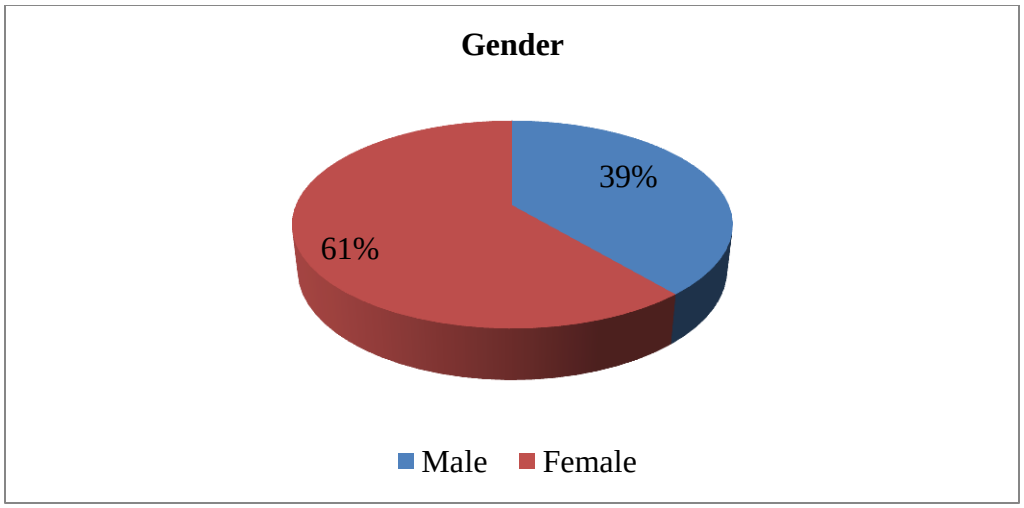

Figure 1.3: Gender of the respondents

According to the findings, 38.8% were male and 61.2% were female. This contrasts (Azeem and Quddus, 2014) study conducted in Maulna Azad National University which found out that, majority (71.4%) was males.

Age

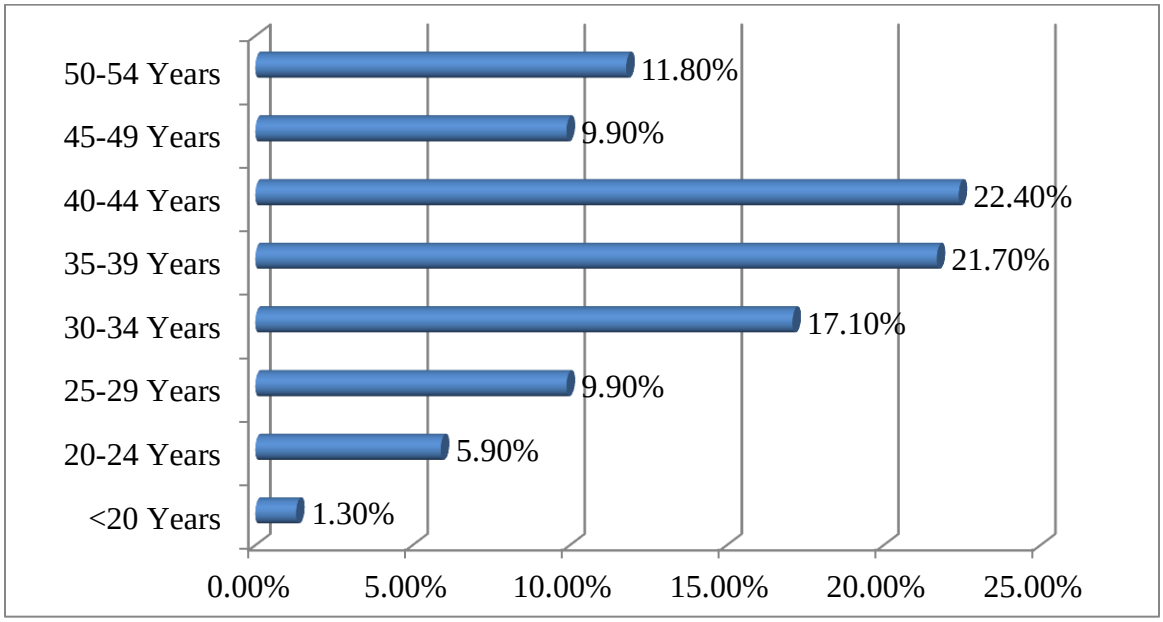

Figure 1.4: Age of the respondents

Marital Status and Education Level of the Respondents

ISBN 978-9966-132-53-6 @ Copy Right .2019

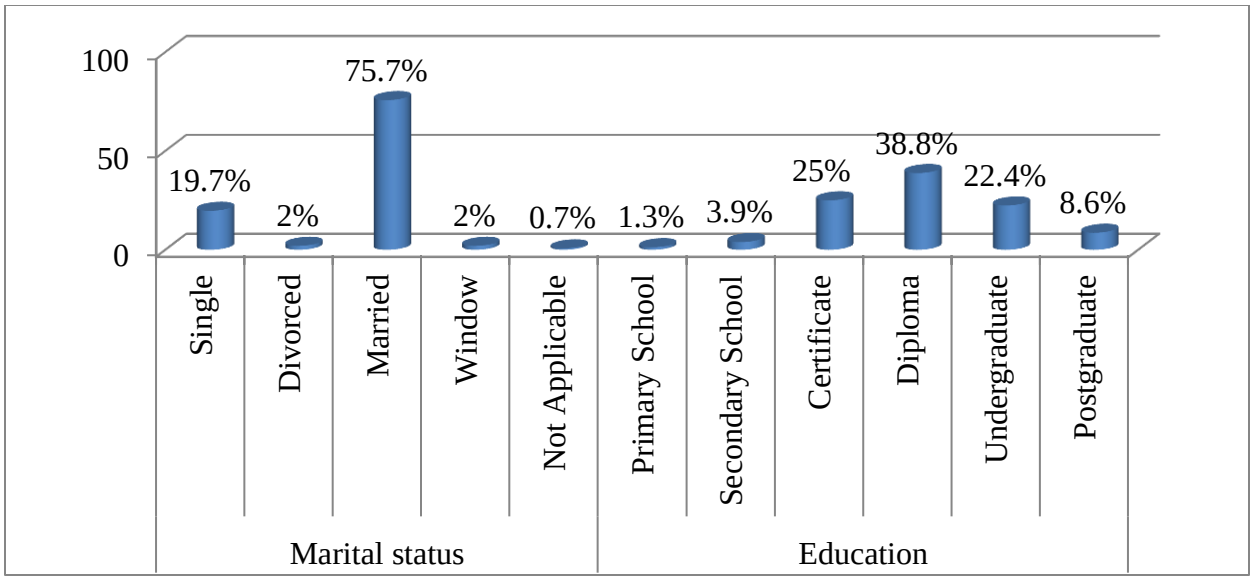

Figure 1.4: Marital Status and Education Level of the Respondents

The majority of the respondents (75.7%) were married while minority 0.7% was of the opinion that, marriage is not applicable. This concur with (Kosgey, Mutai and Lagat, 2018) where 89% of the respondents were married. Meanwhile, majority (38.8%) had a diploma as the highest level of education while the minority (1.3%) held a primary level certificate.

Experience, Terms of Service and Level in the Organizational Structure

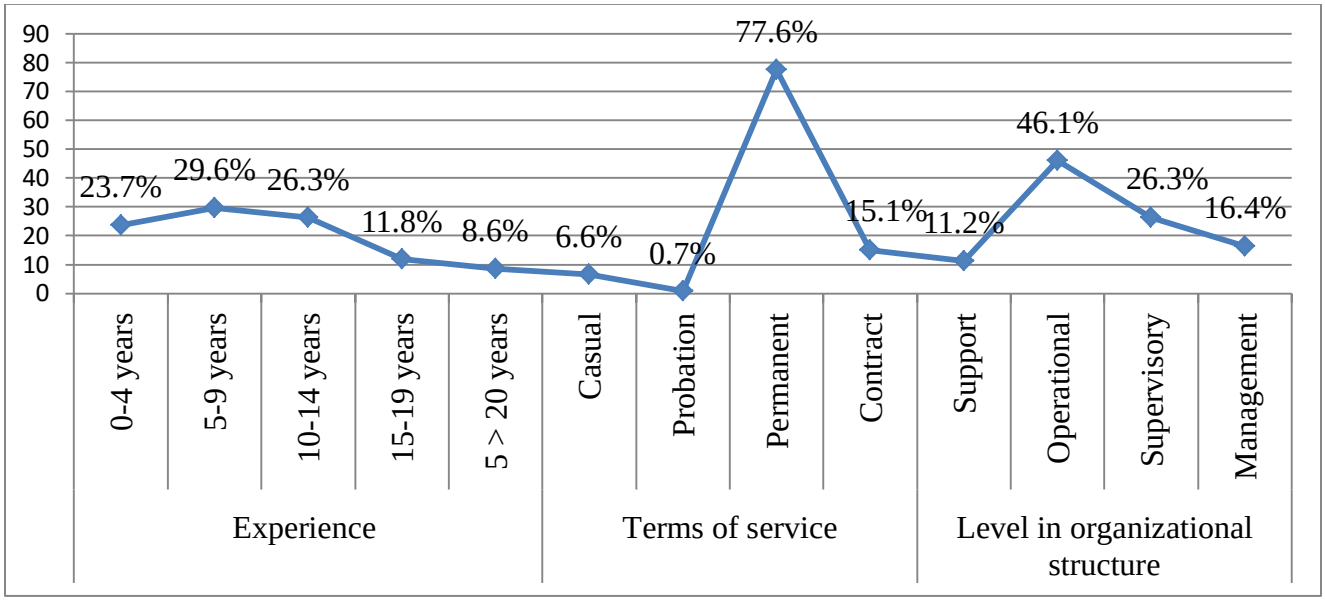

Figure 1.5: **Experience, Terms of Service and Level in the Organizational Structure**

The study revealed that, majority (29.6%) had an experience of between 5-9 years while the minority (8.6%) had an experience of >20 years of age. Majority (77.6%) were employed on permanent terms of service while the minority (0.7%) was on probation. In terms of their levels in organizational structure, majority (46.1%) described themselves as operational while minority (11.2%) described themselves as support staffs.

Table 1.4: Relationship between Employee's Welfare Initiatives and Job Stability

Correlations	Job Stability		
Welfare initiatives	Pearson Correlation	Sig. (2-tailed)	Decision
Sporting Facilities	-.024	.768	Reject $H0_1$, Accept$H1_1$
Housing facilities	-.020	.810	Reject $H0_1$, Accept$H1_1$
Medical facilities	-.040	.628	Reject $H0_1$, Accept$H1_1$
Recreation facilities	-.011	.895	Reject $H0_1$, Accept$H1_1$
Sufficient toilets	-.003	.971	Reject $H0_1$, Accept$H1_1$
Meals allowance	.024	.771	Reject $H0_1$, Accept$H1_1$
Long service grants	-.012	.879	Reject $H0_1$, Accept$H1_1$
Canteen facilities	-.110	.178	Reject $H0_1$, Accept$H1_1$
Paid holidays	.031	.701	Reject $H0_1$, Accept$H1_1$
Rest rooms	-.047	.562	Reject $H0_1$, Accept$H1_1$
Leave policy	-.106	.195	Reject $H0_1$, Accept$H1_1$
Regular salary	-.031	.705	Reject $H0_1$, Accept$H1_1$
Pension policy	-.089	.276	Reject $H0_1$, Accept$H1_1$
Counseling services	-.095	.245	Reject $H0_1$, Accept$H1_1$
Uniforms	.120	.142	Reject $H0_1$, Accept$H1_1$
Clean safe working station	.019	.814	Reject $H0_1$, Accept$H1_1$
Employees funeral assistance	-.033	.688	Reject $H0_1$, Accept$H1_1$
Employees transfer assistance	.006	.937	Reject $H0_1$, Accept$H1_1$

The above table exhbits that, there is a moderate to strong positive significant relationship between medical facilities and job stability of university catering employees. This concurs with (Omonijo, Oludayo, Eche, Uche, and Ohunakin, 2015) that, medical allowance is offered to employees in faith based institutions of higher learning in South-West Nigeria. According to table, there is a strong positive relationship between welfare initiatives; sporting facilities (0.768), housing, (0.890), recreational facilities (0.651) and job stability. This concurs with (Amirnejad and Asploor, 2016) study at Islamic Azad University, which found out that, sporting facilities should be provided to employees working in universities. Meanwhile, there is a strong positive association between housing facilities and job stability. This concurs with (Amirnejad and Asploor, 2016) that, housing provide comfort to the employees. The findings exhibits that, there is a significant strong positive relationship between recreational facilities and job stability. This concurs with (Akala, 2012) that, ''job stability is influenced by recreational facilities''. According to table, there is a significant positive relationship between the welfare initiatives; paid holidays (0.701), leave policy (0.195), staff uniforms (0.142), pension policy (2.76), long service grants (0.879), meals allowance (0.771), canteen facilities, (0.178), sufficient number of toilets (0.971) with job stability of university catering employees. However, there is a moderate significant positive relationship between restrooms (0.562) and job stability. This concurs with (Rawat and Chaubey, 2016) that, restroom facilities increase job satisfaction. The findings on the sufficient number of toilets concur with that of (Shoss, Eisenberger, Restubog and Zgenczyk, et.al., 2013). The findings demostrated a significant relationship on meals allowance, this concurs with (Mohd Joarder. H.R., 2012), study that, HRM practices have a significant impact on effective commitment.

The findings that, there is a significant relationship between long service grants and job stability contrasts the study by (Ruby, 2012) which was conducted at the Central University College of Ghana, where majority (92%) said that, long service awards is provided to a little extent. The findings revealed that, there is a significant positive relationship between paid holidays and job stability. This concurs with (Waleed, 2011) study which was conducted at Edith Cowan University of United Arab Emirates which stated that, ticket allowances enable employees to stay in an organization.The table demostrated that, there is a signifiant positive relationship between welfare initiatives; regular salary increment (.705), clean safe working enivirоment (.814), employees assistance on transfer (0.937) and job stability. The findings on clean safe working stations concurs with contrasts (Shefali and Shikha, 2017) that, employees welfare activities assist the employees to develop a sense of belonging. The findings further demostrated that, there is a significant moderate to strong positive relationship between employees funeral assistance and job stability.

Hypothesis Testing: Employee's Welfare Initiatives and Job Stability

The study determined the relationship between employee's welfare initiatives and job stability of catering employees in selected universities within the Nairobi City County, Kenya. The study tested the following hypotheses stated in null and alternative forms.

H02: there is no significant relationship between employee's welfare initiatives and job stability of university catering employees in Nairobi City County, Kenya

H12: there is a significant relationship between employee's welfare initiatives and job stability of university catering employees in Nairobi City County, Kenya.

Chi-Square test was done to establish whether there was a significant relationship between employee's welfare initiatives and job stability of university catering employees in Nairobi City County, Kenya. A p-value of <5 was considered as significant and the results were as shown;

Table 1.6: Hypothesis Testing: Employee's Welfare Initiatives and Job Stability

Welfare Initiatives	Chi-Square	df	P-Value (Asymp. Sig.)
Sporting Facilities	14.118[a]	4	.007
leave policy	8.855[a]	4	.065
Salary increment	5.039[a]	4	.283
A comprehensive pension policy	47.276[a]	4	.000
Sufficient number of toilets	68.592[a]	4	.000
Meals allowance	98.789[a]	4	.000
Long service grants	82.671[a]	4	.000
Canteen facilities	70.895[a]	4	.000
Counseling services	49.053[a]	4	.000
Housing facilities	77.408[a]	4	.000
Paid holidays	98.592[a]	4	.000
Recreation facilities	46.092[a]	4	.000
Rest rooms	71.355[a]	4	.000
Medical facilities	78.395[a]	4	.000
Uniforms	118.789[a]	4	.000
Safe and clean working station	123.921[a]	4	.000
Employees assistance on death	9.645[a]	4	.047
Employees assistance on transfer	4.908[a]	4	.297
Job Stability	150.566[a]	4	.000

The findings presented an x^2=14.118, DF*=4 and the p=0.007 which is < 0.05. With a significance level < 0.05, (0.000) < the H11 was accepted while the H01 was rejected. The results showed that, there is a significant

relationship between employee's welfare initiatives and job stability of university catering employees in Nairobi City County, Kenya. The implication of this x^2 test result is that, welfare initiatives can be attributed to job stability of university catering employees in Nairobi City County, Kenya. The same can be said of all the other welfare initiatives on the table shown with the exception of; (leave policy, salary increment, Employees assistance on death and Employees assistance on transfer). This means that, there is no significant relationship between employee's welfare initiatives (leave policy, salary increment, Employees assistance on death and Employees assistance on transfer) and job stability of university catering employees in Nairobi City County, Kenya

Table 1.7: Summary of Hypothesis Testing.

Hypothesis	Level of significance	Acceptance/Rejection
H02: there is no significant relationship between employee's welfare initiatives and job stability of university catering employees in Nairobi City County, Kenya	Pearson Chi-Square coefficient=14.118 P-value = 0.007 P-value is < 0.05.	H11 is accepted.
H12: there is a significant relationship between employee's welfare initiatives and job stability of university catering employees in Nairobi City County, Kenya.		

The findings presented a p-value of (0.000) which is less than 0.05 as shown in the table above. The findings of hypothesis testing presented a p-value of (0.007) as shown in the table above. The alternative hypothesis was accepted indicating that, there is a significant relationship between employee's welfare initiatives and job stability of university catering employees in Nairobi City County, Kenya.

SUMMARY, CONCLUSIONS AND RECOMMEDATIONS

Introduction

The study sought to establish the relationship between welfare initiatives and job stability of university catering employees in Nairobi City County, Kenya.

Relationship Employee's Welfare Initiatives and Job Stability

The objective sought to establish the relationship between welfare initiatives and job stability of catering employees in selected universities within the Nairobi City County, Kenya. The two tailed Pearson correlation results revealed that, there is a moderate to strong positive significant relationship between medical facilities and job stability of university catering employees. According to the findings, there is a strong positive relationship between welfare initiatives; sporting facilities (0.768), housing, (0.890), recreational facilities (0.651) and job stability. Meanwhile, there is a strong positive association between housing facilities and job stability. The findings exhibits that, there is a significant strong positive relationship between recreational facilities and job stability. According to table, there is a significant positive relationship between the welfare initiatives; paid holidays (0.701), leave policy (0.195), staff uniforms (0.142), pension policy (2.76), long service grants (0.879), meals allowance (0.771), canteen facilities, (0.178), sufficient number of toilets (0.971) with job stability of university catering employees. However, there is a moderate significant positive relationship between restrooms (0.562) and job stability.

Recommendations

1. Universities management should invest more on welfare initiatives of catering employees in universities. Particularly, they should concentrate on those which had strong relationship with job stability such as; sporting facilities and recreational facilities.

2. Universities management should revise welfare initiatives at least twice a year using a participative approach where members of a certain specific specialization are grouped and allowed an opportunity to give their views on the performance of existing ones and propose new ones for onward discussion with the university councils.

3. Involving employees in decision concerning their welfare initiatives should be embraced by the universities management to ensure that, their real needs are addressed.

The effect of physical evidence strategy on performance of Alcohol Manufacturing and Distributing Firms in Kenya

Caroline Anupi Abuli[1], Dr. Elishiba Murigi[2]

Lecturer, Kenyatta University-Department of Business Administration

E-mail Address: caroline.abuli@gmail.com

Masters Student, Kenyatta University-Department of Business Administration

E-mail Address: Murigi.elishiba@ku.ac.ke

Abstract

Background: The centrality of adopting an effective physical evidence strategy has long been recognised as a strategic priority for both researchers and business practitioners.

Purpose: The purpose of this study was to establish the effect of physical evidence strategy on performance of Alcohol Manufacturing and Distributing Firms in Kenya.

Method: Primary data methodology was adopted, which involved use of structured questionnaires administered to a sample of 64 respondents selected from 32 companies that have concrete company structures with marketing and sales departments. A purposeful sampling technique was used to select participants. The unit of observation was 2 respondents per firm thus a population of 64 employees participated in the study. Data collected was coded and entered into SPSS version 21 software and analysed quantitatively to generate descriptive and inferential statistics.

Results: Findings from the study revealed a strong correlation between physical evidence strategies and performance of alcohol manufacturing and distributing firms in Kenya (r=0. .814). Additionally, physical evidence strategy have a positive and significant relationship with the performance of Alcohol Manufacturing and Distributing Firms (r=0.880; p=0.00, p<0.05).

Conclusions: The study concluded that physical evidence strategy significantly affects the performance of Alcohol Manufacturing and Distributing Firms.

Recommendation: The study recommends that alcohol manufacturing and distributing firms need to create physical evidence that makes them identifiable by the customers.

Key words: ***physical evidence, marketing, strategy, Alcohol Manufacturing and Distributing Firms in Kenya.***

1.0 Introduction

1.1 Background

The global business environment is characterized by increased competition emanating from both local and international organisations. The dynamics and complexities that define the modern-day market environment continue to threaten business success (Amondi, Senaji &Thuo, 2017). Businesses are striving to maintain their competitive advantages through implementation of relevant marketing strategies for purposes of strengthening shares and overcoming the jaws of cutthroat competition (Adewale, Adesola, & Oyewale, 2013). Owomoyela *et al*. (2013) defines a marketing strategy as a way of providing customers with quality products that satisfy their needs and also providing competitive prices that are affordable through effective promotion and distribution strategies. Marketing strategies are embedded in the 7P's of the marketing mix including product, price, promotion, placement, people, processes and physical evidence (Amondi, Senaji &Thuo, 2017). However, only physical evidence as a marketing strategy is given attention in this study.

Physical evidence strategy refers to all the tangible traces of a business or company that customers encounter prior to buying of goods/ services. These include waiters, agents, branding outlets of companies among others (Gongera, 2012).Physical evidence and personality of a firm are fused together to produce desired wishes of the firm in the market place (Betts, 1994). Physical evidence includes: the design and construction of the facility, well-groomed employees, clean and well maintained premises, well-manicured lawns, good food and beverage facilities with excellent presentation. The surrounding and visible cues greatly impact client impression concerning the product or services they receive. This physical evidence includes company image, company structure, trademark and company colour (Wawira, 2016).

Business organisations aim to improve performance through implementation of physical evidence strategy. According to Dalgic (2013), the performance of an organization is equated to how the firm is able to compete in the industry by attaining efficiency in production process which results to market sustainability. The quantification of different result activities within a firm on a given period of time is used in measurement of performance (Juma & Okibo, 2016). In the process of measuring performance there is the need to establish a link between objectives and firms results. The methods that most organisations use to measure performance include the balanced scorecard, Deming model, and the BALDRIGE model.

The beverage industry has a significant role in the economic development of the country through taxes and creation of employment. Kenya Revenue Authority reveals that as at 31st January 2018 there are 263 alcohol beverage firms in Kenya. NACADA is responsible for regulating production, marketing and consumption of alcohol in the country.

1.2 Problem

Achievement of Kenya's Vision 2030 is anchored on incorporating the manufacturing sector as a key pillar. The sector is projected to grow at 8% annually over a period of 20 years for the realization of the vision 2030. However, the inability of manufacturing firms to grow at the target rate is threatening the realization of vision Kenya's 2030, this is because the targets are achievable if the sector is making realistic profits. Furthermore, several studies done on marketing strategies and performance (Adewale, Adesola and Oyewale, 2013; Amondi, Senaji and Thuo, 2017; Arasa and Gathinji, 2014; Ardjouman and Asma, 2015). However, these studies were centred on developed and other countries other than Kenya. Additionally, most of the previous were largely were centred on the 4ps marketing strategies. Therefore, the study sough to address this gap by investigating the effect of marketing strategies by bringing in a different dimension namely physical evidence and analyse how it affects performance of Alcohol Manufacturing and Distributing Firms in Kenya.

1.3 Objective

To establish the effect of physical evidence strategy on performance of Alcohol Manufacturing and Distributing Firms in Kenya.

1.4 Research Question

What is the effect of physical evidence strategy on performance of Alcohol Manufacturing and Distributing Firms in Kenya?

1.5 Significance

Findings from the study will assist them in the management of the firms which may lead to greater performance of these firms. Similarly, the study may be beneficial to the Kenyan state policy makers in formulating policies that may enhance the performance of Alcohol industry which in turn may boost the economy. Furthermore, the research findings may be beneficial to academicians and researchers who may find gaps in the existing literature and further research on other variables that have an impact on the phenomena of performance. In addition, the research findings may be of relevance as it may create new knowledge to be added to the existing ones.

2.0 Literature Review

2.1 Theoretical Review

2.1.1 Competitive Advantage Theory

This theory was put forward by Michael Porter in 1985, and it postulates that countries and organizations should make use of policies that allow the production of good quality goods that are supposed to sell at very suitable prices within markets. Porter (1985) emphasizes that the growth of productivity growth as being highly related to national strategies. Competitive advantage describes the ability gained with the applications of attributes and resources to perform better than others that they are related with in the sector. The study of competitive advantage has ensured that huge research takes place within organizations that put it into good use. A firm has a competitive advantage when it uses strategies that are not widely used by other firms (Karaba, 2012).

This theory is good for this study as it postulate that unique feature of a firm gives a firm an edge over its competitors in the business environment and thus, leading to greater performance. This can be link to the physical evidence strategy of a firm which leads to greater performance of that firm. The presence of sales representative and other company features boost sales which in turn enhance performance. Therefore, when strategies are implemented effectively, it brings about the superior performance of an organization by providing it with competitive advantage to outshine market participants (Passemard & Calantone, 2000). In ensuring that there is competitive advantage, a business strategy of an organization should manipulate the various resources which is able to control, and these resources have are capable of bringing about advantages regarding competition *(Powell, 2001)*.

2.1.2 The Balanced Scorecard Model

This model was brought forth by Kaplan and Norton in 1992 to provide managers and executives with efficient and effective ways of assessing performance. Both financial and non-financial measures are relevant under this model. The balanced scorecard model considers a variety of perspectives including customer, financial, internal business process, and learning and growth perspectives when evaluating performance. Companies concentrate on processing, delivering and manufacturing, as well as the development of products as examples (Martins, 2015). The foundation of this view is associated with the perspective of customers, considering that to keep customers satisfied, a firm has to concentrate on its components which are important to them. If late delivery leads to dissatisfaction of target customers, a firm must then focus on the internal process of refining the current system in use or develop a more

efficient and effective delivery system. To accomplish this, managers are busy carrying out effective analysis and integrating new innovations. (Wawira, 2016).

2.2 Empirical Review

2.2.1 Physical Evidence Strategy and Performance

Amondi *et al.*, (2017) assessed the effects that come along with marketing strategies regarding the performance of the water and sewerage companies in Kenya. The study was more concerned with NCWSC. It adopted a research design that was descriptive in nature and involved descriptions and observations with regard to the behavior of a subject without including any manipulation, the target population was 300 and a sample size of 171 respondents was used. The sampling design was random sample and the data collection method was questionnaires. The findings of the study indicated that physical evidence impacts positively on performance of NCWSC. It was more concerned with NCWSC in Kenya. The current study will address this gap by focusing on Alcohol Manufacturing and Distributing Firms in Kenya.

Dzisi and Ofosu (2015) studied the effect of marketing strategies on the performance of SMEs in Ghana in terms of their profitability, brand awareness and market share. The variables considered in the study were customer service strategy, physical evidence strategy and product repositioning strategy. The study made use of correlation and regression analysis, the results of the study indicates that physical evidence has a positive and significant effect on performance of SMEs in Ghana. Notably, the study was centred on SMEs in Ghana. The current study will be based on Alcohol Manufacturing and Distributing Firms in Kenya.

A study was conducted by Ebrahim & Hussain (2010) regarding the development of products development and how commercial banks perform. Physical evidence and performance were the independent and dependent variables of the study respectively. The study was based on a multiple regression analysis. Findings derived from the study indicate that physical evidence has a positive and significant effect when it comes to how commercial banks perform. In addressing the contextual gap, the study in question will be based on Alcohol Manufacturing and Distributing Firms in Kenya.

A study by Wawira (2016) explained how marketing strategies such as physical evidence strategy affected performance of Large Hotels in Nairobi City County. The population comprised of all the large hotels in Nairobi registered and licensed by the Tourism Regulatory Authority. Only five and four star hotels based in Nairobi were studied. This made a total of 30 hotels. The findings from multiple regression analysis show that product development strategies had a positive relationship with performance of Large Hotels in Nairobi County, Kenya. The study concluded that marketing strategies positively affects performance of large hotels in Nairobi. The study recommends that top priority should be given to marketing strategies.

2.3 Conceptual Framework

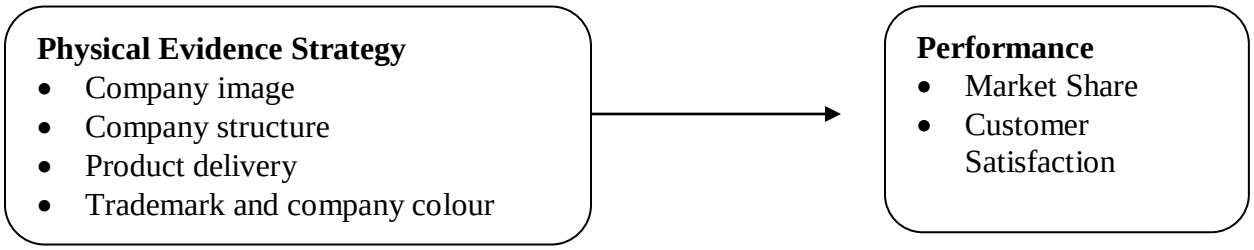

Fig 1: Conceptual Framework

Source: Researcher, 2019

3.0 Research Methodology

A descriptive research design was adopted in this study. The target population of the study will be 32 Alcohol Manufacturing and Distributing Firms in Nairobi, Kenya. For the current study, the target population of the study will be 32 Alcohol Manufacturing and Distributing Firms in Nairobi, Kenya. The study adopted a multiple regression model for the analysis of the study. The multiple regression model took the form of:

$Y = \beta o + \beta_4 X_4 + \alpha$

Where:

Y = performance;

X_4= Physical Evidence Strategy

B_0=Constant

The purposive sampling was used in selecting alcohol and distribution firms out of the 263 listed by KRA according to their establishment and structure. According to Mugenda and Mugenda (2003), a descriptive design sample size must be between 10-30% of the population. Thus, a sample of 32 alcohol and distributions firms was used which is about 12.2% of the population. The brand marketing managers and sales representative were the respondents of the study. Therefore, a sample of one brand manager and one sales representative from the 32 firms was retrieved through the questionnaire. Thus, the total was 64 respondents.

The research instrument for data collection is questionnaire. Data was collected using structured research questionnaires (closed ended questions) which were pretested in a pilot study and necessary adjustments made thereafter. The questionnaires comprised of a likert scale of 1 to 5 which aided in assigning numerical values to the responses. The researcher employed both descriptive and inferential analysis in analyzing the study data. Validity and reliability of the research instruments were confirmed before data collection and making conclusions. Prior to data collection and eventual processing of data, the researcher ensured that the current study adheres to all ethical standards governing research. A research permit was obtained from National Council of Science and Technology (NACOSTI) and the consent of respondents sought before administering the questionnaires to them.

4.0 Findings and Discussions

4.1 Reliability Tests

The study used Cronbach alpha to test for reliability of data. The acceptance value of 0.70 was used as cut-off of the reliability for the study. Results are presented in table 1.

Table 1: Reliability Statistics

Variable	Cronbach alpha	Items	Comments
Physical evidence	0.980	10	Acceptable

The study findings indicated that the data instruments were reliability with a Cronbach alpha Value of above 0.70.

4.2 Descriptive Analysis of the Indicators of Physical Evidence

The objective was to establish the effect of physical evidence strategy on performance of alcohol manufacturing and distributing firms in Kenya. The participants of the study responded on statements related to physical evidence strategy. Result findings were presented in table 2.

Table 2: Physical evidence strategy and performance

Statement	Strongly Agree	Agree	Don't Know	Disagree	Strongly Disagree	Mean	Std Dev
High company image aids in driving consumption of the company products.	44.6%	25.0%	1.8%	16.1%	12.5%	2.3	1.5
Presence of sales representative in outlets improves sales volume.	35.7%	33.9%	3.6%	14.3%	12.5%	2.3	1.4
Products are in line with company reputation	50.0%	21.4%	0.0%	10.7%	17.9%	2.3	1.6
Branding of outlets and staff at outlets with company colours helps to improve sales and market share	44.6%	25.0%	3.6%	7.1%	19.6%	2.3	1.6
Customers are more responsive to products that have the company trademark	60.7%	10.7%	0.0%	5.4%	23.2%	2.2	1.7
Average						2.3	1.6

Results in table 2 shows that the aggregate mean score for place is 2.3 and standard deviation is 1.6. The aggregate mean score round off to a score of 2 on the five point likert scale adopted by the study. This implies that on average the respondents' opinions were divided on whether high company image aids in driving consumption of the company products, presence of sales representative in outlets improves sales volume, products are in line with company reputation had respective mean score of 2.4, 2.3 and 2.3 with standard deviation of 1.5, 1.4 and 1.6 respectively.

Results also indicated divided opinions on whether branding of outlets and staff at outlets with company colours helps to improve sales and market share and customers are more responsive to products that have the company trademark had respective mean scores of 2.2 and 2.3 and with standard deviation of 1.7 and 1.6 respectively. The physical evidence strategy recognizes the importance of physical surroundings on customers. Physical evidence is important since it influences not only consumers' cognitive, emotional and physiological states but also their behaviors. Physical evidence is thus, an element of services marketing mix which enables the consumer to evaluate a firm. The results are in agreement with Amondi *et al.*, (2017) that physical evidence impacts positively on performance of Nairobi City Water and Sewerage Company (NCWSC).

4.3 Descriptive Analysis of the Indicators of Performance

The study assessed the performance of alcohol manufacturing and distributing firms in Kenya. The participants of the study responded on statements related to performance of alcohol manufacturing and distributing firms. Result findings were presented in table 3.

Table 3: Performance of alcohol manufacturing and distributing firms

Indicator	Strongly Agree	Agree	Don't Know	Disagree	Strongly Disagree	Mean	Std Dev
Market share	39.3%	26.8%	5.4%	12.5%	16.1%	2.4	1.5
Customer satisfaction	45.4%	30.5%	15.4%	8.8%	0.0%	1.5	0.7

Average	2.1	1.3

Results in Table 4.8 shows that the aggregate mean score for place is 2.1 and standard deviation is 1.3. The aggregate mean score round off to a score of 2 on the five point likert scale adopted by the study. This implies that on average the respondents' opinions were divided on the performance of alcohol manufacturing and distributing firms measured as market share and customer satisfaction had respective mean score of 2.4 and 1.5 with standard deviation of 1.5 and 0.7 respectively.

4.4 Relationship between physical Evidence and Performance of Alcohol Manufacturing and Distributing Firms in Kenya.

4.4.1 Diagnostic Tests

A test for normality was carried out using the Kolmogorov-Smirnov test using the IBM SPSS software and results presented in table 4below.

Table 4: Kolmogorov-Smirnov Test

	Kolmogorov-Smirnov		
Variable	**Statistic**	**df**	**Sig.**
Physical evidence	0.15	153	0.745

Physical evidence had a significance level of more than 0.05 hence the data was normally distributed.

A multicollinearity test was carried out using the Variance Inflation Factor (VIF) as shown in Table 5.

Table 5: Variance Inflation Factor

Variable	**VIF**	**Comment**
Physical evidence	2.708	No multicollinearity

It was also found that physical evidence had a V.I.F value of 2.708 implying no multicollinearity.

This permitted using regression analysis could to determine the effect of marketing practices on performance of Alcohol Manufacturing and Distributing Firms in Kenya.

4.4.2 Correlation Analysis

Preliminary analysis was carried out to determine whether there were significant associations between physical evidence strategy and performance of Alcohol Manufacturing and Distributing Firms in Kenya. The results of correlation analysis presented in table 5 indicates a strong association between physical evidence strategy and performance of Alcohol Manufacturing and Distributing Firms in Kenya.

Table 5: Correlation Coefficients Matrix

		Performance
Physical evidence	Pearson Correlation	.814**

	Sig.(1-tailed)	0.000

The results also showed that there was a strong significant positive association between physical evidence and performance of alcohol manufacturing and distributing firms in Kenya (r=.814, p=0.000).The results are in agreement with Amondi *et al*., (2017) that physical evidence impacts positively on performance of NCWSC.

4.4.3 Multiple Regression Analysis

The research question was answered through regression physical evidence strategy (independent variable) on performance of Alcohol Manufacturing and Distributing Firms in Kenya (dependent variable). The relevant results are presented in Tables 6(a-c).

Table 6(a): Goodness-of-fit for physical evidence strategy

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
	.814	.663	.657	.23324

Table 6(a) present model fit statistics for the regression model fitted to the data. The results show that physical evidence explains 65.7% of variation in the performance of alcohol manufacturing and distributing firm. Physical evidence strategy refers to all the tangible traces of a business or company that customers encounter prior to buying of goods/ services. These include waiters, agents, branding outlets of companies among others (Gongera, 2012). Physical evidence and personality of a firm are fused together to produce desired wishes of the firm in the market place. Physical evidence includes: the design and construction of the facility, well-groomed employees, clean and well maintained premises, well-manicured lawns, good food and beverage facilities with excellent presentation.

Table 6(b): ANOVA for the Regression of physical evidence strategy

Model		Sum of Squares	df	Mean Square	F	Sig.
	Regression	5.774	1	5.774	106.127	.000
	Residual	2.938	54	.054		
	Total	8.711	55			

Table 6(b) presents the Analysis of Variance (ANOVA) statistics. The results indicate that the model with one predictor variable (physical evidence) was statistically significant and predicts the dependent variable (performance of alcohol manufacturing and distributing firm). This results is supported with the F-Statistic equal to 106.127and the calculated p-value equal to 0.00<0.05. The results agree with Dzisi and Ofosu (2015) that physical evidence strategy significantly affects the performance of SMEs in Ghana in terms of their profitability, brand awareness and market share. The surrounding and visible cues greatly impact client impression concerning the product or services they receive.

Table 6(c): Significance of the Regression of physical evidence strategy

Model	Unstandardized Coefficients		Standardized Coefficients	t	Sig.
	B	Std. Error	Beta		
(Constant)	.046	.132		.350	.728
physical evidence	.880	.085	.814	10.302	.000
Dependent Variable: performance					

The regression coefficients of the model were presented in Table 4.15 (c). From the analysis, physical evidence was found to have a positive and significant relationship with performance of alcohol manufacturing and distributing firm (r=.880, p=0.000<0.05). This means that a unitary increase in physical evidence will lead to a corresponding

.880 unit increase in performance of alcohol manufacturing and distributing firm. Physical evidence enhances firm's visibility. The physical evidence is the outward appearance of the organization and thus can be critical in forming initial impression or setting up customer expectations. Therefore, the ability of physical surroundings to facilitate achievement of organizational as well as marketing goals is apparent. The results agree with Ebrahim *et al.* (2010) that physical evidence has a positive and significant effect on firms' performance.

The specific model was:

*Performance of alcohol manufacturing and distributing firm =.046+.880*X_4

Where X_4 is physical evidence.

The results also showed that physical evidence and performance of Alcohol Manufacturing and Distributing Firms in Kenya have a positive and significant relationship (r=.465, p=.000).The results agree with Ebrahim *et al.* (2010) that physical evidence has a positive and significant effect on firms' performance.

5.0 Conclusions

The objective of the study was to establish the effect of physical evidence strategy on performance of Alcohol Manufacturing and Distributing Firms in Kenya. Correlation analysis revealed a strong significant positive association between physical evidence and performance of alcohol manufacturing and distributing firms. Regression analysis indicated that physical evidence and performance of Alcohol Manufacturing and Distributing Firms in Kenya have a positive and significant relationship. Physical evidence was found to be satisfactory in explaining performance of Alcohol Manufacturing and Distributing Firms in Kenya.

Physical evidence strategy significantly influences the performance of Alcohol Manufacturing and Distributing Firms. Physical Evidence (services cape) could be seen as the environment in which the service is assembled and in which the seller and customer interact; combined with tangible commodities that facilities performance or communication of the service. The physical evidence strategy recognizes the importance of physical surroundings on customers. Physical evidence is important since it influences not only consumers' cognitive, emotional and physiological states but also their behaviors. Physical evidence is thus, an element of services marketing mix which enables the consumer to evaluate a firm.

6.0 Implications

The study established that physical evidence is satisfactory in explaining performance of Alcohol Manufacturing and Distributing Firms in Kenya. The revelation that physical evidence significantly explains performance of Alcohol Manufacturing and Distributing supports the postulations of Competitive Advantage Theory that that unique feature of a firm gives a firm an edge over its competitors in the business environment and thus, leading to greater performance.

7.0 Recommendations

Based on the findings of the study, physical evidence enhances firm's visibility. The physical evidence is the outward appearance of the organization and thus can be critical in forming initial impression or setting up customer expectations. Therefore, the ability of physical surroundings to facilitate achievement of organizational as well as marketing goals is apparent. The study recommends that alcohol manufacturing and distributing firms need to create physical evidence that makes them identifiable by the customers.

Sti In Adolescents In Kenya

Carolyne Kemunto Mati Mba Student- Project Management

carolynmati@gmail.com

Absract

Introduction

In the past years, the government of Kenya through National AIDS and STI Control program (NASCOP) has made known of HIV prevention, treatment and care to everyone. There have been massive efforts and strategies/ innovations like introduction of PrEP and PEP which is helping in minimizing HIV transmission. Despite these efforts, it is noted that the rate of STIs in adolescent is on the rise. I therefore, sought to know what can be done urgently to help the public especially the adolescent from this alarming situation.

Methods

The researcher looked into the ongoing Prevention Options for Women Evaluation Research (POWER) study; PrEP implementation Science to AGYW 16 to 25 year's females conducted in Kisimu in JOOTRH and KMET from September 2018 to date. (By Prof. Bukusi etal; not yet published).

Results

The prevalence who go tested positive of gonorrhea between September 2018 to January 2019 was 23(6%), 33(9%). Those who got tested positive of Chlamydia were 58(16%), 77(20%) and gonorrhea and/Chlamydia were 72(19%) and 96(25%) for Kisumu JOOTRH and Kisumu medical and education Trust (KMET) respectively.

Conclusion /Recommendation

When left untreated, syphilis not only kills and gonorrhea/chlamydia causes infertility but also facilitate HIV transmission and thus impedes the Nations progress towards elimination of HIV in Kenya. These calls for urgent/rapid education on STI prevention, treatment and care even as loud as HIV. Testing of STI should be up scaled in facilities to enable early diagnosis and treatment. Parents are also called upon to make their homes friendly and where sexuality and morals are taught.

Determinants Of E-Commerce Adoption In The Tourism Sectorin Nairobi County: A Case Study Of Tours And Safaris Firms.

Catherine. A. Sijenyi, PhD student ,University of Nairobi

Business Administration -Strategic information systems

Abstract

The use of Information technology has grown tremendously in the businesses. The use of Information Technology by businesses is vital in determining their performance. Various methods of operating businesses have been used in the past year, but above all, E-commerce is the newest and rapidly evolving way of doing business .Tour firms in Kenya have adopted E-commerce but they are yet to utilize it fully. Studies have been carried out concerning the adoption of e-commerce by the Small and Medium Sized firms. The study hence tried to find out the factors affecting electronic commerce in the tourism industry with the main focus being on the Tour and Safaris firms in Nairobi town. The objectives of the study were; to find out the technological, organizational and environmental factors that affected the adoption of electronic commerce in the Tours and safaris firms. In addition, the study also tried to establish the level of electronic commerce adoption by the Tour and Safaris firms. The study population was 292 tours and Safaris firms. Descriptive research was utilized in the study where it was established that the Tour and the safaris firms had already adopted the electronic commerce. Additionally, majority of the firms had few employees and hence were termed to be Small and Medium Sized firms. It was also established the firms' managers were young and learned. The size of the firm, age and gender greatly influenced the adoption of electronic commerce .The study also found out that the firms had already adopted the e-commerce and it was mainly applied in the marketing of their products, customer care services and electronic payment systems.

Key words: ***E-commerce adoption, E-tourism, E- hospitality, E- tour operators, E -destination,E-tour agencies,tours and safaris firms.***

Introduction

Background of the Study

The information technology sector has really grown at a higher rate for the past few years. This has happened at the 21st century and has continued to grow up to this century. The introduction of the internet has solved many problems such as the dissolution of physical borders hence making people all over the word keep in touch. The information era has grown tremendously because of the internet .The internet has made available information which is useful to people especially through the web. At the beginning, the scientific, military and academic research used the internet at a higher rate, however this has changed with time and the internet has been used mostly for communication purposes. The expansion of computer networks has come along with its own benefits such has enabling communication globally. The internet is currently being used in businesses and majorities have adopted this concept in their organizations. The process of conducting businesses through the internet is known as electronic commerce or electronic business.

Many authors have defined e-commerce in different ways. For instance Turban and Chung, 2010 define e commerce as a process of buying and selling of goods as well services through the computer. Schneider,G.P (2003) defined e-commerce as the use of electronic data transmission for implementation and enhancing of business processes. He reported that e-commerce actually encompassed many more business activities other than shopping over the web. He further said that some businesses used the term e-business to mean e-commerce in a broad perspective. He argued that, for decades business organizations have been using different electronic communication tools in conducting different business transactions .For instance the banks have been using EFTs to transfer customers' money globally. They also have been using EDI to place orders and send business documents such as invoices and

the retailers have also been able to use advertisements in generating orders. Kenya has also not been left behind in these developments. There has been the upgrading of the internet system in terms of the infrastructures as well as the installation of a very fast telecommunication network. These developments have seen many businesses being technology oriented and are now shifting into using the e-commerce in conducting their businesses. Electronic commerce therefore has made firms increase their sales as well as reducing operating costs such as handling sales inquiries, provision of price quotations and determining of available goods and services (Schneider, G.P,2003)

According to world stats, Africa was home to 167 million internet users in June 2012, this number has tremendously grown (2000-2019) at a rate of 10.815% with a penetration rate of 37.3%. This penetration is low in comparison to the developed countries such a South America (89.4%). Subsequently, the tourism industry for the past 30 years has been affected by the emergence of ICT for example in the early 1970's the Computer Reservation System (CRS) and the Global Distribution System (GDS) which happened in the 1980's and the developments of internet in the 1990's have caused revolutions in the tourism sector. According to the European Union E-business Market Watch (2004) the internet has had a very great impact in the tourism industry. The tourism industry in Kenya has continued to make forays into the Kenyan retail segment. Despite the fact that companies have seen the importance of adopting the e- commerce as their alternative source of information, there are some challenges that these firms face. The study seeks to investigate these factors that determine the adoption of the e-commerce especially by the tour firms.

Statement of the problem

The preceding background of the study clearly shows a very large gap between the developing and most of the developed countries regarding the implementation of electronic commerce. This has caused a digital divide between the African countries especially Kenya and other developed country in the world. There is diminutive information that has been recognized regarding the electronic commerce adoption in Kenya. The existing data has shown that there is gradual adoption of e-commerce hence deterring the advancement and efficiency of business functions. Crespi et.al (2004) and Al-Qirim(2001) established that there is little investments in e-commerce by firms which has caused a slow uptake in changing business processes. This in turn has also affected its growth. From the above reasons, the third world countries such as Kenya have not completely acquired all the advantages a business gets by investing in e-commerce.

Studies have been carried out concerning the adoption of e-commerce by Small and Medium Sized firms such as the Tour and safaris firms. Majority of these studies have been focused on some developed countries such as Egypt(Abdel Nasser,2002), Libya(Mohamed Ibrahim et.al.,2011) ,Jordan (Sattam Alamro,2011) , Saudi Arabia (Clegg.B.et.al., 2011) , China (wang, 2009) and New Zealand (Al-Qirim, 2007).There have been handful studies done in the Less Developed countries; Iran (Afzul,2008), Nigeria (Aghaunor.L.et.al., 2006) and Indonesia (Nazir.R.et.al., 2012).A few studies have been done on the adoption of e-commerce in evolving economies(Wang.et.al,2010).

Research objectives

The main objective of the study was to examine the determinants of electronic commerce. The specific objectives of the study were;

1. To find out the organizational determinants of e commerce adoption in the tourism sector in Nairobi County
2. To examine the environmental factors of e-commerce adoption in the tourism sector in Nairobi County
3. To establish the technological factors of e-commerce adoption in the tourism sector in Nairobi County.

Scope of study

The study concentrated on the Tours and Safaris firms in Nairobi. The firms studied were those registered by the Kenya Association of Tour Operators (KATO).A population of 292 Tours and safaris firms was used as the study

sample. The main factors examined in the study were; technological, environmental and organizational determinants. The study also concentrated on establishing the main application of electronic commerce used by the firms. These applications included electronic marketing, electronic customer service and electronic procurement .

Significance of the study

The study will be useful to the academicians in that it will help them become aware of the situation on ground concerning e-commerce in the tour firms in Kenya. These will include understanding of the extent of e-commerce adoption and the advantages a firm gets when it adopts e-commerce. The study would also help them to be aware of the main determinants of e-commerce.

The research will also be of significance to the tour firms and the government of Kenya. The information from the study will help them learn how to deal with problems in e-commerce and how they can also speed up the adoption of e-commerce by the tour firms. The study will also help deepen awareness within the tourism sector on the need to conduct business online for greater efficiency and customer satisfaction.

Litereture Review

Theoretical literature

Consumer's behavior regarding their perception on adoption of e-commerce has been explained with the aid of numerous theories. These theories include; TPB(Theory of planned Behavior),TAM(Technology Acceptance Model),TRA(Theory of reasoned Action) ,Diffusion of Innovation Theory(DOI) and Technological, organizational and environmental model (TOE).

Theory of Reasoned Action (TRA)

The Theory of Reasoned Action was developed by Martin Fishbein and Icek in 1967 to enhance the understanding of how attitudes and behavior are related (Ajzen & Fishbein,1980). The theory was plainly concerned with behavior. It also recognizes that there are factors that limit the influence of attitude of behavior. It predicts behavioral intention, and uses two elements, attitudes and norms to predict behavioral target. The theory further predicts that behavioral intent is created or caused by two factors; attitudes and subjective norms.

Subject norms have been defined as the "person's perception that most people who are important to him think he should or should not perform the behavior in question". According to TRA, a person's attitude towards a behavior is determined by his beliefs on the consequences of the behavior, in addition of his evaluation of these consequences. The TRA has been criticized in that it has neglected the importance of social factors that tend to be a factor in influencing individual behavior(Grandon&Mykytyn,2004). The theory does not explain the beliefs that predict particular behavior.

This theory was used in the study to explain consumer decision processes. The consumers who use the internet tend to have different behaviors related to consumer processes such as motivation and need recognition, information search, alternatives evaluation, purchase decision and purchase outcomes. The study focused on the internet behavior that consumers have such as the use of banner ads in e-marketing, e-mail communication and information search on the website.

The theory was also significant in analyzing the effects of interventions on behavior. For instance it was used in assessing the fundamental factors that could be used in encouraging the top management towards promoting the adoption of e-commerce. It was utilized in investigating the essential factors that can be used in encouraging the top management towards promoting the adoption of e-commerce.

Technology Acceptance Model (TAM)

This theory was developed by Davis (1986) and it is based on the Theory of Reasoned Action. The model concentrates more on the perception of individuals or organizations towards the usefulness and how easy it is to use technology. The TAM focuses mainly on the prediction of the acceptability of an information system. The model has been used in predicting the acceptability of a tool and to identify the improvements which might be done to the system so as to make it acceptable.

According to the model, the degree of individuals to accept an information system is influenced by two main factors; *perceived usefulness and perceived ease of use.* Davis (1989) emphasizes more on the impact the use of a certain system would have on an individual besides his/her attitude. Thus, even if workers do not welcome a certain Information System, the likelihood of him/her using it will be high if he perceived that the system will improve his performance at work. TAM links the perceived usefulness and the perceived ease of use. For instance, if two systems offer similar features, a user will attach more usefulness to the one that he/she finds easier to use (Dillon, 1996)

This model was important in the study because it assisted in the determination of the factors that influence e-commerce adoption in terms of its perceived usefulness. According to OECD (2004), the benefits of using ICT are many. They include enhanced information in terms of speed, availability of information whenever it's needed and also enhances customer care service whereby they can be served anytime on line. This in turn improves the efficiency of a business since it is easy to get immediate feedback.

Theory of Planned Behavior (TPB)

In 1985, Ajzen introduced the Theory of Planned Behavior (TPB) useful in management science especially Management Information System. This theory is used in the prediction of individuals' intention to engage in a behavior at a specific time and place. For over 45 years, the TPB has developed from the theories of reasoned action, expectancy value and other motivational theories (Fishbein & Ajzen, 2010). This theory was used by Grandon (2004) to explain the e-commerce adoption in Chile's SMEs. In the study, this theory was utilized to enlighten more on the management such as explaining the changes in manager's behavior and their attitude. Top management support was said to be a key predictor in the acquisition and diffusion of innovations. They further declared that top management could develop a clear cut e-commerce about the importance of its adoption in businesses.

Diffusion of Innovation Theory (DOI)

The Diffusion of Innovation theory (DOI) is among the oldest social science theories. It was first developed in 1962 by E.M. Rogers. This theory has its roots in communication where it's used to explain how an idea or product over time can gain diffusion or spread through a certain population or social system .Diffusion is the process in which an innovation is communicated through certain channels over time in a society (Rogers,1995).

Adoption of new ideas, behavior or products does not happen simultaneously in a social system. It is usually a process whereby some people are more willing to adopt the new ideas than others. According to Rogers (2003),when promoting an innovation to a target population ,it is important to understand the characteristics of the target population that will help or hinder adoption of the innovation. He further established adopter categories and came up with strategies in which firms can use to deal with each category. The categories included; innovators (risk takers) ,early adopters(opinion leaders),early majority, late majority and lastly the laggards.

The stages of adopting a new idea and where diffusion is completed, include; awareness of the need to adopt, decision of adopting or rejecting, the initial use of the innovation and the continued use of the innovation. Rogers (2003) further came up with the factors that influence the adoption of innovations. These factors are; relative advantage, compatibility, complexity, triability and observability.This model mainly focuses on how innovations can influence the adoption of e-commerce. This model was crucial in explaining the attitude and behavior that accompany people in technological adoption.

Technological, Organizational and Environmental model (TOE)

This theory was developed in 1990 by Tornatzky and Fleisher. The theory was developed to explain the adoption and implementation process of IT by firms which influenced by the technological context, organizational context and the environmental context.*Technological context (*includes the internal and external technologies that are relevant to the firm. They include equipment used by the firms such as computers and the processes used), *organizational context:* (encompasses the factors within the firm; firm's resources, the firm's size, degree of centralization and formalization, management structure and human resources), *environmental context (*includes the size and structure of the industry, the competition as well as the legal environment).These elements determine the constraints and opportunities for technological adoption by firms and hence the theory was applicable in determining the factors that influence e-commerce adoption.

Empirical Literature Review

The development and progress of ICT for the past few years has really affected the operations of electronic tourism. According to Buhalis (2011) transformations in ICT over the few years have been tremendous. For instance, in the 70's there was the Computer Reservation Systems (CRS). Later in the 80's the Global Distribution Systems (GDSS) developed. The major transformation took place later in the 90's which saw the emergence of the internet. These changes have had an advance effect in the tourism operations and strategic plans. E-tourism is further subdivided into various categories. These includes; use of ICT for destination purpose, in airlines, hospitality and tour and travel agencies.

E-Hospitality

This is the use of ICT in hotels. The reason to use ICT in hotels is usually done through the various systems such as the PMSs (Property management system). These systems are used for coordination purposes such as in making customers' reservations and managing inventories in the hotels. They are used to bring together various departments in hotels. For example they connect the administration functions (sales & marketing, finance) with other departments (Buhalis, 2011).

Chan & Law (2006), suggest that hotel websites are very important since they enhance communication between the hotel and its customers and also it assists in strategic management. Hotel's strategic management will involve more emphasis on the quality of the website. Considerations for this include the interface, display of information and the navigation should be easy for the customers. These are very crucial in determining how successful the strategic plan will be. Automatic Website Evaluation System (AWES) is very important to enhance the effectiveness of the websites in terms of a better web design.

E-Tour operators

This is the use of internet by tour operators in promotion of their products. It also includes different ways of attracting new customers as well as retaining the existing ones. They also use the internet to decompose their packages and seek individual products (Buhalis,2011).The benefits of using IT in tour firms was first realized in the 80's. Benefits included marketing, supply and order delivery. Management Systems have been developed by the tour firms, for example the TOP (The Thomson's Line Program). This was used for making reservations for customers. Over time, many tour firms in the world had already adopted database in their businesses and also linked travel agents. All these led to a reduction in costs used to handle information hence leading to increase in speed when it comes to transfer of information.

E-Destination and E-Airlines

The use of internet in tourism destination is known as e-destination. Various systems can be used such as the DMSs which assist in destination planning, management and marketing.E-airlines were introduced mainly because of the complexity of airline operation. In the past years airline reservations were made manually in the boards by having a list of all the passengers. Buhali,2011 reported that the growth of air traffic and air transport de-regulation stimulated the expansion of CRS to gigantic computerized networks. Competition in the airlines was enhanced by the CRS. This was made possible by developing the "hub and spoke" systems while their pricing became very complex and flexible.

E-Tour agencies

ICT use by tour and travel agents is increasing at a higher rate especially in providing information. This in turn creates a link between customers and the firms. There are different reservation systems used by tour and travel agents which enable them to check availability and make reservation for tourism products (Buhalis,2011). Travel agents have been using the GDSs to get information on customers and in reservations. In addition they offered internal management modules integrating the "back office"(Accounts, Marketing and Human resource) and "front" office(Order and delivery, history of customers).

Determinants of E-commerce adoption

Environmental Determinants

Environmental determinants of e-commerce adoption are also referred to as e-environment. According to Chaffey.(2004), the e-environment is composed of different factors which includes; social factors, legal factors, economic and competitive factors, political factors and technological innovation and assessment. There many factors that affect internet penetration in countries. These factors include; income, infrastructure, computer ownership, telecommunication availability and pricing, social and cultural traditions, business attitudes, and wireless web access (Strauus, J., 2009).

According to Efraim (2004), e-commerce is so new that the legal, ethical and other public policy issues that are necessary for e-commerce existence are still evolving. Yet, these issues are important in e-commerce as they encompass one of the major pillars that support e-commerce. E-commerce related legal issues include privacy, intellectual property, free speech, and taxation and consumer protection. Consumers thus need to be protected because online businesses gather and use demographic information from users who are afraid that their personal data including credit card numbers or their behaviour on the Net may be sold, used or revealed in an appropriate manner. Additionally (Krishnamurthy, 2003) posits that, a copy right usually protects them with exclusive. Consequently, Lacit (2006) established that there are two main business environments that affect adoption of e-commerce by businesses. They include partners and competitive pressure. Trading partners includes the suppliers and customers. Environmental determinants include the market comprising of customer's tastes and preferences and the population structure of the market.

Afzal (2008) argues that in e-competition we have both starters and adopters. These parties in e-commerce face competition in their businesses irrespective of their levels in the market. They both operate as the compete which led to the same considerations about this factor. E-competition was found to be highly significant in non-adopters. According to McKay (2004) competitive analysis is important and it should be applied in e-business initiatives. This would include considering the industrial factors and competitors, competitive influences exerted along the supply chain, the stability of demand and the likelihood of new entrants. These factors play a major role when it comes to e-commerce adoption by tour firms.

Mamaghani (2009) postulates that there are difficulties related to e-commerce adoption some especially in the tourism sector. Customers' behaviour towards e-commerce can change and this in turn can make customers shift from one tour firm to another. This happens because of the expectations that consumers have regarding the

transaction of business online. Therefore if firms want to adopt e-commerce, there is need for them to be focused on various issues such as the availability of products and services offered, readily available updates on what is being offered online. Consequently, the main consumer activities online includes; connect, create, enjoy, learn and trade (Strauus,J.,2009) ,thus the marketers have a role to play especially in maintaining customer relationship.

Technological Determinants

The technological environment is of significant importance. New markets have changed due to technology. Significant advancements in technology have taken place in the recent years where the ultimate goal of the Global Information Infrastructure (GII) has been' any information, anywhere, anytime'. This has seen two major technological routes being developed to achieve this objective; wireless and broadband landlines (Chen.S, 2005). The internet based technologies have offered many advantages compared to the traditional EDI network such as low costs and reaching of customers globally. The internet technologies have greatly developed and some of the important technological innovations include; PC modems, Word Wide Web, Browsers and Java. These technologies are being used inside (intranets) and outside (extranets) the firms.

Turban (2010), proposed that companies would be forced to adopt a Darwinian way of struggling due to progressing transactions of business online. This includes learning and adapting to the advancements in technology. The firms will also benefit whereby they will be able to test new products in the market hence affecting their strategic plans. Advancements in technology will force the companies to use different organizational plans. Sattam (2011) analysed two major advantages of e-commerce in businesses; improvement in the accessibility of information about products offered by the firms and long term improved customer care services.

According to Chaffey (2004) there is need for e- business managers to have some knowledge on how various determinants can affect the internet usage by the customers. He suggest the following being important in determining e-commerce adoption; financial constraints, individuals not having accessibility to computers, internet connection especially on investment costs. There is need to consider how the websites content are and the navigation of such. Fear of the unknown where some people generally have fear of the technology and new media for example case of fraud and privacy infringement.

Molla & Licker (2005) established that a website is very important when transacting business online. A good website can affect the success of a business. A website should be designed in such a way that the information displayed to customers is attractive to them. There is also need to take care of issues regarding cyber-crimes and privacy of the customers. This in turn will enhance the efficiency of the firms leading to attraction of more customers. Aladwania and Palvia (2002) on analyzing different sites including a bank, bookshop, and car manufacturing concluded that the quality of a firm's website was very important. They identified the important dimensions of a website to be; specific content, how the website appears, the quality of its contents and the technological adequacy. These factors were found to determine the frequency of visits to the websites by the customers.

Organizational Determinants

These are factors that determine e-commerce adoption and are influenced by a firm itself. They are micro factors found within the firm internally. They include the size of the firm, the resources and technological advancements issues in transacting e-business. Rashid and Al-Qirim(2001) reported that the size of a firm affects its e-commerce adoption. Most of the small sized firms can affect their adoption. According to Fallon &Moran (2000) the size of a firm is defined in terms of the number of workers as well as the level of e-business adoption. This therefore plays a

major role in e-commerce adoption. Lun et.al (2012) also established that the size of a firm is indicated by the degree of the resources that it has. Internal factors include the resources of the firm which are composed of finances, IT quality and usage and also the human resources. Crespi et.al (2004) found out that there were too main factors affecting the usage of e-commerce in business. These were; cost of technological advancement and network externalities. He mentioned other factors as firm characteristics such as size, age and ownership of the organization, learning which includes learning by doing and learning from other firms.

E-business will be effective if an organization has policies to govern it and the strategies that are in line with the organizational needs. Organizations stand to benefit from improved managerial understanding of the related strategic opportunities and decision making and as such, develop more innovative ways of combining online and offline business processes to compete and improve their performance. Zhu.K.et.al (2005) says that IT readiness in an organization operates on two basic components namely technical readiness which includes technological infrastructure and personnel IT knowledge which includes human resources.

According to Wang (2009), the main determinants of e-commerce adoption is support from the managers in the organizations. For a firm to succeed in e-commerce adoption to people in the top management are expected to be supportive and use it in business activities and processes. Afzul (2008) on research about SMEs in Iran found that the CEOs innovativeness was significant in e-commerce adoption. It seemed that the SMEs perceived that the CEOs innovativeness was useful in the e-commerce usage. CEOs involvement was a main factor in the e-commerce adoption. However, there are various barriers to e-commerce adoption in e-tourism. They include lack of adequate informational fit-to- task, high financial costs, confidential problems, poor web appearance and also inadequate skilled personnel and customers being reluctant to transact business online (Kim and Stoel ,2004).

Conceptual framework

The dependent variable is adoption of e-commerce while the independent variables include; organizational, environmental and technological related determinants. Organizational determinants include factors within the firm its self. For instance individual factors like support from managers, firms' size and its IT readiness. Environmental determinants are particularly customers, government policies such as taxation, competition and suppliers .Finally technological factors include; complexity in using IT, security and confidentiality issues.

Research Methodology

Research design

The method used for the study was descriptive research. According to Orodho (2003) the method involves use of interviews and filling in of questionnaires to collect data from respondents. The main purpose of using this method is because it describes the state of affairs as they exist at the present (Kothari C.R, 2012).The study utilized the descriptive research approach.

The Target Population and Sample Size

According to Kothari C.R (2012) population refers to the total of items about which information is desired. It includes characteristics and attributes of the objects being studied. In a study where populations are small a sample size of more than 30 objects are usually required unlike where population is large which results to different methods of selecting the population. A good representative sample usually represents at least 10% of the whole population (Gay, 1981). The study therefore targeted a population of 292 tour firms and 30 companies where people at the top management were used in collection of data.

Sampling strategy

Probability sampling was used since it gives every member of the population equal chance of being selected (Kombo.D.K, 2002). Simple random sampling was also used to pick the random respondents. This ensured that selection of all respondents in the targeted population was done equally and independently.

Data Collection Tools and Techniques

Primary data was collected using both structured and unstructured questionnaires. Journals, textbooks, statistical abstracts and other written materials were used to collect secondary data. Open ended and closed ended questionnaires were given to the respondents by visiting them and others were e mailed to enable fast responses.

Data Analysis

Quantitative data was analyzed using descriptive statistics such as frequency counts and percentages. The SPSS was used in analyzing of the data. Frequency distribution tables and various graphs were also used.

SUMMARY OF THE MAIN FINDINGS

The outcome of the study showed that most of the tour firms were owned by men who represented 64% of the respondents who were considered to be youth (53.6 % aged 35 years and below). The study also revealed that most of the respondents' education level was at diploma level. The history of the firms was also established. The study revealed that most of them had worked in the firms for a larger period (between 6- 10 years). It was established that the Tour and Safaris firms were Small medium Enterprises (SMEs) with a greater part having 6-10 employees. The general perception on the use of internet has also investigated. The study established that all the firms had access to the internet.

The study was also carried out to determine the electronic applications used by the tour and safaris firms. The firms used the internet to carry out their marketing and advertisements such as providing information on their products on the web. Electronic customer care support services were also used, for instance the firms provided feedback to customers online and utilized e-mail communication and fax as main ways of communicating to their customers. Electronic payment systems were used mostly in transferring money online by use of debit and credit cards. In addition they also used the internet in order and deliver of goods.

The organizational factors were found to have influenced e-commerce adoption by the tour included; innovation by managers, lack of interest by management, high financial risk and a well-defined strategy for information technology. The study found that among the organizational determinants a well-defined strategy for IT highly influenced e-commerce adoption. Absence of innovation by managers and lack of interest in IT had a significant effect on e-commerce adoption. The study has therefore indicated that organizational factors have a role when firms want to adopt e-commerce.

The technological factors were also studied and they were found to play a major role in e-commerce adoption by firms. Financial factors was seen as the main factor that influenced e-commerce adoption such as high costs involved when developing internet connection and websites. The high cost of computers and network technologies were the main technological factors that influenced the level of adopting e-commerce by firms. Managerial factors also affected e-commerce adoption especially the level of IT and employees' skills. It is therefore clear that firms should consider these factors as they try to adopt e-commerce.

Environmental determinants were found to have influenced the adoption of e-commerce. These are the external factors that determine if a firm will transact business online or not. The factors on consumers were rated to have the greatest influence. For instance the firms reported that they used e-commerce mainly to maintain a strong link with their customers and also to have a user-friendly web interface. The quality of technical infrastructure was reported to have a limited effect on adoption of e-commerce. The government policies and laws on cyber-crimes are other important factors that influence online businesses especially in protection of consumer rights.

Factor analysis was also done on the three determinants to determine those factors whose correlation was high. The study established that from the nine environmental factors four were found out to highly influence e-commerce. These factors included; government policies on protecting consumer privacy and promoting e-commerce, friendly web interface, good technical infrastructure and lack of trust. Two factors extracted from the technological factors were ascertained to affect e-commerce adoption. These were; low level of IT knowledge by the employees and high cost of IT. The organizational factor analysis was also determined and two factors highly influenced e-commerce adoption; lack of interest by management and financial risk, management innovativeness and a well-defined strategy in technology.

CONCLUSION

The study established that the tour firms had adopted e-commerce. The environmental, organizational and technological determinants influenced the use of e-commerce by the tour firms with the environmental factors highly rated since the customers were perceived to be the main reason why the firms had adopted e-commerce .The level of e-commerce was determined by investigating on the various departments on the use of various e-applications. The main department studied included; sales and marketing department, purchases and supplies department and finance department. These departments were reported to be using different e-applications in their businesses. The firms had various reasons for using the internet and most of them reported that they saw it as an opportunity to expand and grow as well as enhancing time saving in transacting business. In addition, the customers demand to use the internet was not seen as the main reason why the firms adopted e-commerce.

RECOMMENDATIONS

The following recommendations are suggested;

1. Government support in terms of infrastructure, legislation and inclusion of e-commerce in the countries development plans such as the vision 2030.The legislation should also focus on the issues of confidentiality and trust while transacting business online. Cybercrime is a major problem nowadays and the government has to come in and try to come up with solutions
2. The firms should try to build a one-to-one relationship with their customers. E-commerce allows businesses to create this relationship which does not exist in other marketing systems. The management should therefore be focused on different approaches to boost loyalty and increase customers trust. For instance they can achieve this through product customization, personalized services and getting the customers involved in cyber space.
3. Firms can also try to use models specifically designed to assist in e-commerce. This will include them redesigning of the existing websites putting more emphasis on how to attract new customers and retain the existing ones.
4. The firms can try to invest in several techniques to protect intellectual property and not just depend on the government for security issues. The three main assets that a firm must protect are customer's computers, computer communication channels and the web services. They should provide secrecy and integrity of the services. For instance they can use encryption to provide secrecy and digital certificate to both integrity controls and user authentication.

FURTHER RESEARCH

The study's main focus was on three main determinants; technological, environmental and organizational. However, these are not all determinants of e-commerce. From the study the researcher realized that some determinants were left out that really played major role in adopting e-commerce.for instance, the environmental factors focused on the role of government and suppliers, besides this, there are other environmental factors such as social and cultural factors. The study did not focus on these factors thus more case studies can be done on these factors.

Additionally, more research can be carried out on the e-commerce adoption with focus being diverted more on consumers' behavior and attitude toward e-commerce adoption because they are the reasons why a business can succeed or fail. E-business systems are also important in a business and they do affect transaction of business online. It is therefore necessary to have further studies carried on these systems and how they influence the level of e-commerce adoption.
Finally, the study presented a cross-sectional research. There is need for further research on longitudinal studies examining e-commerce adoption and the implementation process, the impact it has on firm's performance for sustainable competitive advantage.

Strathmore University, Kenya

Abstract

The failure of commercial banks in an economy can lead to loss of confidence among depositors and stakeholders in the banking sector. This research focused on the assessment that CEO attributes have on financial distress in commercial banks in Kenya. The objectives included the tier based assessment of financial distress in Kenyan commercial banks and the assessment of the effect of CEO attributes on financial distress in Kenyan commercial. A causal research design was employed to 42 commercial banks in Kenya which also formed the population and sample. Multi-discriminant analysis technique (MDA) was employed and the findings revealed that 18% of the commercial banks in tier II and III were financially distressed. The findings also indicated that CEO tenure has a significant and negative relationship with financial distress in Kenyan commercial banks. The findings implied that close monitoring of commercial banks should be done to mitigate the risk of financial distress and that the commercial banks should consider hiring young managers to avoid the risk of financial distress.

Key words: ***Chef Executive Officer, Attributes, Commercial Banks, Financial Distress***

1.1 Background of the study

Bank failures and financial crises are economic hazards which cause economic policy derailment and damage to the growth of commercial bank and finance (Ali, 2007). The growth and expansion of commercial banks offer significant benefit to economies and enable the objectives of financial liberalization by enhancing competition in the banking industry, stimulate progresses in service to clienteles and expansion of access to loans among the domestic small and medium scale businesses.

Chan and Heang (2010) adds that the role of the banking industry is fundamentally significant in guaranteeing the smoothness of monetary policy transmission in less developed countries as it offers the core source of financing to businesses. In this context, banks act as asset transformer in transforming client deposits into loans as bank assets. However, the attainment of these benefits has been endangered because commercial banks have been susceptible to financial distress (Brownbridge, 1998). Similarly,

In Kenya, commercial banks performance has not been impressive over the last decade even with several reforms in place to improve performance, stability, productivity, financial accessibility and efficiency (Onuonga, 2014).

The Kenyan financial industry has seen 37 financial institution face financial distress, out of which 25 non-bank financial institutions have been liquidated and12 banks liquidated (Deposit Protection Fund Board Kenya, 2014). According to CBK (2016), 2 more banks have been put under receivership and 1 under statutory management. However, the extent of financial distress among the different banks tiers is unknown and this presents a knowledge gap that prompted this study.

Motivation of the Study

The banking sector is an essential portion of any economy and failure of commercial banks can lead to loss of confidence among depositors and stakeholders in the banking sector. Some of the causes of failure of commercial banks include: insider lending, non performing loans (Waweru & Kalani, 2009) although there is still inconsistency in results of causes of financial distress in financial institutions (Schaeck & Cihak, 2007).

Some scholars believe that CEOs are key in the operations of firms including commercial banks due to their individual managerial and entrepreneurship skills which are deemed to be critical in the enterprise growth and performance to a large extent (Fama and Jensen, 1983; Wu, 2014). Past research has shown that the individual attributes of age, ethnicity, level of education, gender, work experience, office tenure have mix influence on firm performance (Barno, 2017; Bhaiyat & Garrow, 2015; Croci & Jankensgard, 2014 and Dittmar & Duchin, 2012). The varied related research findings have arisen in varied geographical locations, varied industry, using varied methodology and even after employing varied sample sizes. It appears that there is no consensus on the subject and

hence justifying the current research on whether CEO attributes possess influence on the financial distress of commercial banks in Kenya.

1.3Research objectives

This study aimed at fulfilling the following objectives:

1.3.1 Main objective

The main objective of this research was to assess the effects of CEO attributes on financial distress in commercial banks in Kenya.

1.3.2 Specific objectives

(i) To determine the extent of financial distress in the different bank tiers in commercial banks in Kenya.
(ii) To assess the significance of the CEO attributes on financial distress in commercial banks in Kenya.

2.2 Theoretical framework

2.2.1 Agency Theory

In financial economics, agency theory was put forth to address the principal-agent association brought about by existence of corporations whose leadership were managers not owners (Habbash, 2010; Getahun, 2013). The segregation of corporate ownership from management in current institutions paves way for the context of application the theory(Harun, 2017). Habbash (2010) alludes to the fact that institution owners are extensively spread hence they do not partake in daily processes and leadership of their own institutions somewhat leading them to hire managers to manage the daily affairs of their corporation on their behalf led by the CEO with expectations of high returns. Similarly, Getahun (2013) asserts that majority of the owners hardly have time and skill required to manage a firm leading to ultimate return on investment and firm value.

Agency theory stipulates that, institution that employ appropriate corporate governance aim at increasing shareholders value by eradicating persistent conflict of interest that occur amongst owners and managers. In this view point, the shareholders elect and appoint board of directors whose mandate is to monitor actions of the management by providing strategic directions in place of shareholders as an avenue to reduce conflict of interest and are also tasked to hire a CEO to steer the organization (Getahun, 2013). This imply that the standard of corporate governance grounds the nature of the relationship among stakeholders.

Agency problem is not new to corporates due to differing goals between owners and hired managers (Naushad & Malik, 2015). For instance, owners are interested in gaining maximum value while CEOs may have goals such as contract renewal, bonuses, image and industry dominance (Jensen & Meckling, 1976). Jensen and Meckling (1976) defined agency relationship as an agreement under which the principal delegates decisions making authority to the agent. Even though CEOs have formal authority over the institutions they manage, agency problem emanates from information asymmetry where they are better placed with information regarding better ways to invest funds (Burgaz, 1997). CEOs may be limited on their contracts although they hold extensive rights which may lead to problem of corporate management (Fama & Jensen, 1983) .

Agency theory proposes that alignment of the agent and principal interests results in maximizing of the interest of the shareholders. Corporate rules and regulations assist in alleviating agency costs by streamlining management and shareholders' interests to avoid financial distress (Manini & Abdillahi, 2015). The theory prescribes that management led by their CEO should be answerable in their tasks, action and responsibilities (Abdullah & Valentine, 2009).The agency theory was adopted as it helps to explain why firms fail leading to financial distress.

2.2.2 The Upper Echelons Theory

The upper echelons theory explains that firm performance is wholly dependent on the efficiency and the efforts pulled together by those bestowed to provided leadership to the organization specifically the CEO (Hambrick and Mason, 1984). Hence, the growth and overall performance of an institution is usually mirrored to the CEO. The theory specifically mentions that CEOs perspective of the institution they provide leadership is shaped by the strategies they chose to put forth that underscores future wellbeing of the institution. The theory adds that the CEOs vision in that case; the perception of the environment is delimited by their understanding base and standards they hold. The theory explains that the human capacity is limited to the information it can process at any given time, as a result, decisions to act on the matters arising in the surrounding is purely dependent on the depositions exposure and individual characteristics. Individual attributes thus influence decision making process.

According to Oppong (2014), personal characteristics can greatly influence facets of the surrounding that can be viewed, suggesting that what can be viewed and processed by the mind ultimately enlightens the eventual decisions and strategies to be employed which is reflective of firm performance. As a result, Hambrick and Mason (1984) suggest the need to evaluate individual characteristics that can be seen such as education levels, professional qualifications and societal background of the top leader in the corporate context. In this regard, factors such as CEO age, CEO years of experience, CEO educational background and level, CEO tenure, CEO gender can be examined to check for their influence on decision making process and strategies that affect institution future prospects (Hood, 2008; Juravich, 2012; Herri, Johan, Handika, & Yulihasri, 2017). Therefore, the theory proposes that values and experience which are reflected from attributes of the leader influence organizational performance and must constanstly be under scrutiny to curb financial distress occurence.This theory was applicable in identifying the main CEO attributes that influence financial distress.

RESEARCH METHODOLOGY

3.1 Research Design

The study employed causal research design was used to evaluate the extent of financial distress among bank tiers and significant CEO attributes on financial distress among commercial banks in Kenya.

3.2 Population and Sampling

This research considered a census approach. Cooper and Schindler (2011) defined census as consideration of all the total count of all the element in the population. The population of this research was obtained from CBK website (Appendix II) totaling to 42.The census was necessary due to the small nature of the population (Cooper & Schindler, 2011) and to enhance accuracy of the research results.

3.4 Data collection methods

The study employed secondary method of data collection. The analyzed data was obtained from CBK annual supervisory report available in the website and financial and annual reports of commercials banks' available in their individual website. The period under study was one year (2016) which was cross-sectional. The data was utilized to answer objective one and two.

3.5 Data analysis technique

The data collected was evaluated based on the research problem. Data analysis can be described as the method of analyzing data and techniques for interpreting the results obtained. Multi discriminant analysis was employed to analyze secondary data. Discriminant function analysis was performed to determine how CEO attributes influence financial distress in commercial banks in Kenya. The discriminant analysis obtains a model to predict a single qualitative variable from one or more independent variables in research (Cramer, 2003). The discriminant analysis derives an equation as a linear combination of the independent variables that will discriminate best between groups

in the dependent variable (Ramayah, Ahmad, Halim, Zainal, & Lo, 2010). The maximum number of functions obtained is usually either the number of predictor variable or the number of groups minus one whichever is lesser. In order to establish a relationship, a test of P-value was obtained at 5% significance level to test the significance of the CEO attributes on financial distress while Eigen value was used to explain the unexplained variation in the model.

3.6.1 Operationalization of variables

The section presented the measurements used to operationalize the research variables before applying multi discriminant analysis.

3.6.1.1 Dependent Variable

In this research, the dependent variable was determined using the Altman Z-Score model. Altman (1968) pioneered MDA after Beaver's Univariate model. Hauschild (2013) alludes that Z-score as a model is used widely not only for predicting bankruptcy but also navigating model for performance measure for existing businesses. More so, it is an essential tool for emergent entrepreneurial undertakings and early stages of business development plans and those with intention to seek funding. The Z-score model:

$Z = 3.25 + 6.56x_1 + 3.26x_2 + 6.72x_3 + 1.05x_4 + \varepsilon$

Where:

x_1 = (Current Assets-Current Liabilities)/Total Assets

x_2 = Retained earnings/Total Assets

x_3 = Earnings before interest and taxes/Total assets

x_4 = Book value of equity/Total Liability

ε = error term(Altman, 2000; Altman et al., 2017)

The ratings are a means of cutoff between distressed and non-distressed institutions. The ratings used in this study were as follows:

Table 3.1: Zone of discrimination

Cut off	Zone	Description
Z>5.85	Safe Zone	There is least likelihood that the firm will be distress
4.35<Z>5.85	Grey Zone	There is less likelihood that the firm will be distress
Z<4.35	Distress Zone	There is high likelihood that the firm will be distress

Source: Aasen (2011)

3.6.1.2 Independent Variables

Independent variables included: Age, Gender, Education, Tenure and Experience. The table 3.2 shows how the independent variables were computed.

Table 3.2: Operationalization of variables

Variable	Measurement	Literature	Scale
Age of CEO	The difference between the CEOs date of birth and the year of the study	(Alqatamin, Aribi, & Thankom, 2017);	Numeric
Education of the CEO	Last degree of executive formal education members	Herri, Johan, Handika and Yulihasri (2017)	Nominal
Gender of the CEO	Value of 1 if CEO is male and 0 if female	Alqatamin et. al. (2017); Gorts (2016)	Nominal
Tenure of the CEO	Number of years in the work	Herri, Johan, Handika and Yulihasri (2017); Gorts (2016)	Numeric
Experience of CEO	Number of years worked	(Kariuki, Namusonge, & Orwa, 2015)	Numeric

Source: Author (2017)

3.6.2 Research Model

From the conceptual framework, the variables were expressed in a form of a function:

$Fd_{i\ t=} f\ (y_{1it,}\ y_{2it,}\ y_{3it,}\ y_{4it,}\ y_{5it})$

The multi discriminant analysis was used to test the relationship between variables:

$Fd_{it=} \alpha + \beta y_{1it} + \beta y_{2it} + \beta y_{3it} + \beta y_{4it} + \beta y_{5it} + \varepsilon_{it}$…… (2016)

Where: $Fd_{it=}$ financial distress in commercial banks i at time t

α= Intercept

β = discriminant Coefficients

y_1 = Age of CEO

y_2 = Education of CEO

y_3 = Gender of CEO

y_4 = Tenure of CEO

y_5 = Experience of CEO

ε_{it} = error term

3.7 Data Presentation

The quantitative data was mainly presented using tables. The multi discriminant analysis results were presented as generated by the statistical tool and the β coefficients summarized in a tabular format.

3.8 Research quality

3.8.1 Objectivity of research

Objectivity is the explanation of findings of results on the basis of the final results of data analysis as opposed to personal interpretation (Sekaran & Bougie, 2013). The findings of this research were based on the results obtained after analyzing the actual data collected and free from bias or any form of ethical and moral bias held by the researcher.

3.8.2 Validity of the research instrument

Validity is the degree in which an instrument, technique applied or process employed to measure a concept does certainly measure the concept as intended. It is a qualifying check for research (Kothari, 2004; Sekaran & Bougie, 2013). Validity of the research is dire to establish precision and truthfulness of the research. The validity of research was realized.

3.8.3 Ethical consideration

Kumar (2005) defined ethics as a way of conducting oneself in accordance to the principles of conduct that are considered correct especially those in a certain profession. This study was reviewed and designed to ensure integrity, transparency and quality. The Independence of this studywas clear and any conflict of interest was made explicit (Bless & Higson-Smith, 2000; Economic and Social Research Council, 2015). Therefore, in this research, an introduction letter from Strathmore University stating confidentiality and the purpose of research was issued (Appendix I). The information collected was regarded with high privacy and no disclosure whatsoever was made beyond using the information solely in the research.

CHAPTER FOUR – PRESENTATION OF FINDINGS

4.1 Response Rate

The initial data consisted of 42 commercial banks for one year (2016). The raw data was collected from banks websites and CBK website. The initial population was 42 observations (42 banks by 1 year). A total of 4 observations (4 banks by 1 year) had insufficient financial information and were therefore eliminated from the study. Subsequently, the results were based on (42-4) 38 observations in one year. However, CEO attributes for 34 banks were available giving a response rate of 80.95%. The data collected was deemed sufficient for analysis.

4.2 Extent of Financial Distress in Kenyan Commercial Banks

To evaluate financial distress, Altman's model (Z score) was applied to categorize whether an institution was either safe, in a grey area or distressed. The model:

$Z = 3.25 + 6.56x_1 + 3.26x_2 + 6.72x_3 + 1.05x_4 + \varepsilon$…… (2016)

Z represented financial distress, x_1 was arrived at by calculating (Current Assets-Current Liabilities) to Total Assets, x_2 was calculated from Retained earnings to Total Assets, x_3 was derived from Earnings before interest and taxes to Total assets and x_4 by Book value of equity to Total Liability (Altman, 2000; Altman et. al, 2017). The cut off zones for financial distress were: above 5.85 – safe; between 4.35 and 5.85 – grey and below 4.35 were classified as distressed (Aasen, 2011).

The research set out to determine the extent of financial distress in bank tiers in commercial banks in Kenya in 2016. The findings were meant to answer the specific objective one. The first objective was addressed by analyzing Z score components selected from banks financials and grouping them into either distressed, grey or safe as shown in table 4.1 below:

Table 4.1: Summary of level of distress

Bank Tiers	Safe	Grey	Distress	Mean	Min	Max
I	0	8	0	4.9	4.56	5.19
II	1	6	3	4.84	3.49	5.89
III	2	14	4	4.8	2.93	6.06
Totals	3	28	7			
Totals in Percentage	8%	74%	18%			

Table 4.1 shows the distress level under different bank tiers. There were 8 Tier I banks' in 2016 with a mean Z score of 4.9 implying that none of Tier I banks were distressed. The minimum Z score was 4.56 while the maximum was 5.19. Additionally, there were 10 Tier II banks in 2016 were 1 was in safe zone, 6 in grey and 3 were financial distressed. The mean Z score was 4.84 while the minimum was 3.49 and the maximum was 5.89. The mean of 4.84 implies that most of the Tier II banks were in grey area and that there is a large range between those financially distresses and those in grey and safe zone. Among the Tier III banks there were 2 banks on safe zone, 14 on grey zone and 4 financially distressed. The mean of Tier III banks was 4.8 with a minimum of 2.93 and a maximum of 6.06. The results show that there is large range between those in safe and grey and those facing financial distress. Overall, there were 3 banks in safe zone, 28 in grey zone and 7 financially distressed accounting for 8%, 74% and 18% respectively. The results implied that there was presence of financial distress in 2016 among Tier II and Tier III banks. The regulating body, CBK should monitor commercial banks and address causes of financial distress to safeguard the stakeholders (Whitaker, 1999; Ayayi & Sene, 2010; Mostafa, Rezina & Hasan, 2016). The cutoff points for the Z score are: < 3.25 is distress; $3.25<Z<5.85$ is grey while > 5.85 are considered safe (Aasen, 2011)

4.4Effects of CEO attributes on banks' financial distress

4.4.1 CEO attributes descriptive statistics

The second objective of the research was to evaluate the significance of CEO attributes such as age, gender, education level, tenure, experience on the influence of occurrence of financial distress amongst commercial banks in Kenya.

Table 4.2: CEO attributes

	Mean	Median	Mode	Std Deviation	Min	Max	Skewness	Kurtosis
CEO Age	50.09	50	51	7.24	33	66	0.306	0.709
CEO Tenure	5.65	3.25	.67[a]	6.3	0.58	26	1.79	2.64
CEO Experience	24.94	24.5	26	7.1	8	41	0.329	0.627

a. Multiple modes exist. The smallest value is shown

4.4.1.1 CEO age

Table 4.2 shows the findings of the CEO age amongst 34 commercial banks in Kenya in 2016. The age of the CEOs ranged from 33 years to 66 years with a mean of 50.09 years, median of 50 years (SD=7.24), mode of 51 years, skewness of 0.306 which is approximately symmetrical and a kurtosis of 0.709 which is less than 3 is platykurtic. The results illustrate that the average age of CEOs in commercial banks was 50 years implying that they are of mature age to manage demands of performance in commercial banks and to make strategic decisions towards direction of the financial institution (Croci & Jankensgard, 2014; Barno, 2017). Although the age difference betweeen the oldest (66 years) and the youngest (33years) a majority of the CEOs were approximately 50 years as indicated by a skweness of 0.306 which is approximately symmetrical.

4.4.1.2 CEO Tenure

The Table 4.2 shows findings of CEO office tenure to range from 0.58 years to 26 years implying that there was varied number of years held in the office leading to a skewness of 1.79 implying that CEO tenure was highly skewed positively and a kurtosis of 2.64 which is platykurtic. The mean was 5.65 years, median of 3.25 (SD=6.30), and there were several modes. The mean number of office tenure (5.65 years) can be considered long enough to contribute towards financial stability of commercial banks. Barno (2017) suggests that managers need to have a long tenure so that they can have deeper understanding of the company's business and make informed decisions. Other studies with similar stance are Bhaiyat and Garrow (2015),Herri, Johan, Handika and Yulihasri (2017),Kariuki, Namusonge and Orwa (2015) and Kyenze (2014) argue that CEO tenure significantly reduces the likelihood of financial distress.

4.4.1.3 CEO experience

CEO experience as shown in Table 4.2 was found to range from 8 years to 41 years with a mean of 24.94 years and a median of 24.5 years (SD=7.1), mode of 26 years, skewness of 0.329 which is approximately symmetric and kurtosis of 0.627 which is less than 3 implying platykurtic. On average, the CEOs were well experienced to provide leadership in the banks as illustrated by mean of 24.94 years. Additionally, the CEO experience was evenly distributed as shown by a skewness that is approximately symmetrical of 0.329. In addition, experienced CEOs have increasing effect on firm valuation comparative to less experienced CEOs**.** The outcome concurs with Kariuki, Namusonge and Orwa (2015), Kang & Mitnik (2012), Vo & Phan (2013) and Wajiru (2013), Getahun (2013) and Dauda and Hawa (2016) who concluded that firms facing financial mayhem need CEOs who are well experienced and exposed for the positive variability to protect the value of the firm. In addition, adequate skills and wealth of knowledge can be garnered by long period of experience and exposure. Larcker and Tayan (2017) found out that individual and professional characteristics have association to firm performance suggesting that previous experience garnered and work styles are good predictors of future firm performances.

4.4.1.4 CEO Gender

The table 4.3 shows the frequency of male and female CEO in commercial banks in Kenya in the year under study (2016).

Table 4.3: CEO Gender

Gender	Frequency	Percent	Cumulative Percent
Male	31	91.2	91.2
Female	3	8.8	100

Total	34	100

In the year under study (2016), it was established that 91.2% of the CEOs were male while 8.8% were female from data drawn from 34 commercial banks. The results show male CEOs were majority in 2016.

4.4.1.5 CEO education level

Table 4.4 shows educational level of banks' CEOs in 2016.

Table 4.4: CEO education

Education type	Frequency	Percent %
Tertiary	1	2.9
Bachelors	7	20.6
Master	25	73.5
Doctorate	1	2.9
Total	34	100

In the year under review 2016, 2.9% of the CEOs had attained tertiary certification, 20.6% has attained a bachelors qualification, 73.5% had attained a Masters qualification and 2.9% had attained a doctorate qualification. The results show that the CEOs were well educated and acquired training. The level of education is usually associated with open-mindedness and reflects cognitive complexity and ability to discern pattern. All CEOs had acquired training with varied level to equip them handle corporate demands.

4.4.2 Multi Discriminant Analysis of CEO attributes

Discriminant function analysis was performed in order to determine how CEO attributes influence financial distress in commercial banks. Cramer (2003) explains that discriminant analysis is used to obtain a model that can be employed to predict a single qualitative variable from one or more independent variables. Additionally, discriminant analysis helps to identify the independent variables that discriminate a nominally scaled dependent variable (Sekaran & Bougie, 2013). Further, discriminant analysis derives an equation as a linear combination factors of the independent variables that discriminate best between groups in the dependent variable component(Ramayah, Ahmad, Halim, Zainal, & Lo, 2010).The maximum number of functions is either the number of predictors or the number of groups less one whichever is smaller.

4.4.2.1 Wilks Lambda test

In discriminant analysis, the Wilks' Lambda is used to test the significance of the discriminant functions and ranges between 0 to 1. When the resultant value of the lambda of a function is small, the function is considered to be significant. The Wilks' lambda was used test the significance of the discriminant function.

Table 4.5: Wilks' Lambda

Test of Function(s)	Wilks' Lambda	Chi-square	Df	Sig.
1 through 2	.640	12.495	10	.253
2	.872	3.832	4	.429

From Table 4.5, the first discriminant function was statistically significant. The findings imply that the variables applied in testing influence of CEO attributes on financial distress have significance and explain occurrence of financial distress in commercial banks.

4.4.2.2 Eigen value

Eigen value was used to explain the unexplained variation in the model. The Eigen value can be described as a ratio between the explained and the unexplained variation in a model. Eigen values are related to canonical correlations and helps in describing the best discriminating ability of a function.

Table 4.6: Eigen value

Function	Eigen value	Variance %	Cumulative %	Canonical Correlation
1	.363	71.2	71.2	.516
2	.147	28.8	100.0	.358

As displayed in table 4.6 above, the model had a Canonical Correlation Coefficient value of 0.516 indicating an effect size of 26.6% (0.516^2). Hence the model explains 26.6% of the variability in financial distress of commercial banks in Kenya. The findings imply that age, gender, tenure, experience and education explain 26.6% of the occurrence of financial distress among commercial banks.

4.4.2.3 Canonical Discriminant Function Coefficient

In order to establish the unique contribution of each of the variables to the classification of the groups in the dependent variable, canonical discriminant function coefficient was estimated. That means that a discriminant score that belongs to a latent variable can be obtained for each case by applying the coefficients to the values in the respective independent variable. Table 4.7 shows a summary of the Canonical Discriminant Function Coefficients.

Table 4.7: Canonical Discriminant Function Coefficients

	Function	
	1	2
Tenure	.181	-.023
Education	-.226	.170
Age	.006	.287
Gender	-2.763	2.308
Experience	.034	-.203
(Constant)	1.493	-12.148

Unstandardized coefficients

Based on the first discriminant function, a bank's financial distress status can be determined using the following formula:

Distress status = 1.493 + 0.181*Tenure -0.226* Education + .006* age -2.763* Gender + 0.034*Experience + εi

Where;

1.493 = a constant value of financial distress when all independent variables are equal to zero.

0.181 = discriminant coefficient of tenure. For every increase in tenure, there is expected approximately 0.181-point increase in distress, holding all other variables constant.

-0.226 = discriminant coefficient of education. For every increase in education, there is expected approximately 0.226-point decrease in distress, holding all other variables. constant.

0.006 = discriminant coefficient of age. For every increase in age, there is expected approximately 0.006-point increase in distress, holding all other variables constant.

-2.763 = discriminant coefficient of gender. For every change in gender, there is expected approximately 2.763-point decrease in distress, holding all other variables. constant.

0.034 = discriminant coefficient of experience. For every increase in experience, there is expected approximately 0.034-point increase in distress, holding all other variables constant.

εi = Error term in commercial bank i

4.4.2.4 Group membership classification

Additionally, group membership classification was predicted. Group membership shows the level of correct classification into either safe, grey or distress. The classification assists in understanding how well the different classifications (safe, grey, distress) were correctly classified.

Table 4.8: Predicted Group Membership

Classification		Predicted Group Membership			Total
		Distress	Grey	Safe	
Actual (Count)	Distress	2	5	0	7
	Grey	1	22	0	23
	Safe	0	2	1	3
	Ungrouped cases	0	1	0	1
Actual (%)	Distress	28.6	71.4	0	100
	Grey	4.3	95.7	0	100
	Safe	0	66.7	33.3	100
	Ungrouped cases	0	100	0	100

a. 75.8% of original grouped cases correctly classified.

As illustrated by the table 4.8, the multi discriminant function had correct classification of 75.8%, signifying that a majority of the banks were correctly classified by the function (Distress 28.6%, grey 95.7% and safe 33.3%). The findings imply that MDA correctly classified commercial banks by 75.8%. Sulub (2014) found a prediction classification accuracy of 70% while Muya (2017) found a predictive power of 71.2%.

4.4.3 Analysis of the relationship between CEO attributes and financial distress

Univariate analysis was performed to determine the variable significance and contribution to the model. The table 4.9 gives a summary of univariate analysis of the CEO attributes.

Table 4.9: Univariate analysis of the CEO attributes

	Wilks' Lambda	F	df1	df2	Sig.	Test
Age	0.889	1.866	2	30	0.172	Reject
Gender	0.914	1.411	2	30	0.26	Reject
Education	0.97	0.46	2	30	0.635	Reject
Tenure	0.469	2.631	2	30	0.049	Accept
Experience	0.908	1.516	2	30	0.236	Reject

H4: there is a significant and negative relationship between CEO tenure and financial distress

This research established that there exists a positive and statistically significant relationship between CEO tenure and financial distress in commercial banks in Kenya.Therefore,**H4** was accept. The findings show that the longer the tenure the high the probability of occurrence of financial distress in commercial banks. The findings contradict Bhaiyat and Garrow (2015) who evaluated the effect of CEO and CFO attributes as TMT on the firm probability to default and concluded that as the tenure increases the probability of default decreases implying that long period of tenure contributes to stability and efficiency of the firm. The results may have been different since they were carried out in different geographical location and period.

4.5 Summary of results

To sum up the finding in objective one, there was presence of financial distress amongst commercial banks in Kenya in the year under review; 2016.The level of distress was computed using Z-score. The findings showed that 18% of commercial banks were financially distressed in 2016.The distressed commercial banks were in Tier II and Tier III. The occurrence suggested that close monitoring of commercial banks is necessary in order to minimize cases of financial distress (Whitaker, 1999; Ayayi & Sene, 2010; Mostafa, Rezina & Hasan, 2016). For objective two, the main CEO attributes that was found to influence financial distress occurrence was CEO tenure which had a significant and negative effect on financial distress in Kenyan commercial banks.

SUMMARY, CONCLUSIONS AND RECOMMENDATIONS

5.1 Introduction

This chapter presents a comprehensive summary of the findings of both objective one and objective two of the study. In addition, the implications of the study drawn from the conclusions of the study. Lastly it explores the various limitations of the study and gives suggestions for further research. The main objective of this study was to assess the effects of CEO attributes on financial distress in commercial banks in Kenya. The specific objective one was to assess the extent of financial distress in the different bank tiers in commercial banks in Kenya while the second specific objective was to examine the significance of CEO attributes on financial distress in commercial banks in Kenya

5.2 Summary of findings

This section explains the major findings of the study according to the research objectives.

5.2.1 Extent of financial distress among bank tiers in commercial banks in Kenya

The research set out to determine the extent of financial distress among bank tiers in commercial banks in Kenya. The objective was addressed by analyzing the banks financials using Z Score and grouping them into either distressed, grey or safe against bank tiers. None of tier one banks were distressed in the year of study; 2016. Three Tier II banks and four tier III banks were distressed contributing to a total of 18 %. The cutoff points for the Z score were: < 3.25 meant that the bank was in distress; 3.25<Z<5.85 meant that the bank was in grey area while > 5.85 meant that the bank was safe (Aasen, 2011). The findings imply that there is presence of financial distress among commercial banks in Kenya. The regulating body, should monitor commercial banks and detect and correct causes of financial distress to safeguard the stakeholders (Whitaker, 1999; Ayayi & Sene, 2010; Mostafa, Rezina & Hasan, 2016).

5.2.2 Significance of CEO attributes on financial distress in commercial banks in Kenya.

The second objective was to examine the significance of the CEO attributes in relation to occurrence of financial distress. The findings from this study show that CEO age was positive but statistically insignificant in explaining the occurrence of financial distress; $H_1$was reject. The hypothesis stated that there is a significant relationship between CEO age and financial distress. The results from this study agree with Gorts (2016) study on effects of CEO characteristics on corporate financial strategy who found that age did not influence financial decision. The findings however contradict those of Barno (2017)who examined the age of managers in 39 companies listed at the NSE and established that it has a negative but significant effect on capital structure. Similarly, Kyenze (2014) examined 61 companies listed at the NSE for the period spanning 2008-2013 and concludes that there exist a significant association between the ages of the CEO and organizational performance. The findings may have differed due to period covered by the study, methodology used in analysis and nature of the study.

This thesis reports that there is a positive insignificant relationship between CEO gender and financial distress. The findings imply that gender did not explain the occurrence of financial distress although it is argued that demographic diversity of leadership is positively associated with diverse practices that impact organization performance(Nishii, Gotte, & Raver , 2007).The findings concur with research by Chan and Heang (2010) who opined that there was no significance influence between gender diversity and cost signifying that gender did not have influence on overall firm output. Similarly, Manini & Addillahi (2015) posit that gender diversity did not prove any significance to banks profitability, the findings imply that gender variance did not cause financial distress. Likewise, Harun (2017) findings indicate that gender diversity had no statistically significant influence on general financial performance of selected private commercial banks in Ethiopia. Additionally, Kirimi (2015) and Wairimu (2014) point that gender diversity was not statistically significant in determining financial performance. However, Barno (2017) established a negative but significant impact on capital structure indicating that gender has effect on decision making. Additionally, Gorts (2016) points that gender influence corporate financial strategy. Similarly, Vo and Phan (2013) propose involvement of female in corporate decision making since it positively effect on performance of the firms suggesting that inclusion of female in leadership positions influence decision making. Shungu, Ngirande, & Ndlovu (2014) correspondingly concludes that there exists a positive association between gender diversity and commercial bank performance proposing that gender influences firm performance. Therefore, H_2 was reject. The hypothesis stated that there was a significant relationship between CEO gender and financial distress.

The thesis also shows that an insignificant positive relationship exists between CEO education and financial distress. This findings suggest that level of education did not explain the occurrence of financial distress; hence $H_3$was reject. The hypothesis read that there is a significant relationship between CEO education and financial distress. Education is usually associated with open-mindedness and ability to make decision.The research finding concur with Harun

(2017) who concluded that education qualification was positive but insignificant related with the firm financial performance. However, Herri, Johan, Handika, & Yulihasri (2017) established that education level has a negative impact on performance. Similarly, Ting, Azizan and Kweh (2015) found that both younger and longer serving CEOs are risk takers and aggressive regardless of their educational level pointing that education level do not influence firm performance. Further Ting, Azizan and Kweh add that the CEOs with higher levels of education are susceptible increased debt of the organization implying that highly educated CEOs prefer debt financing as opposed to internal sourcing with an aim on rapid growth. Similarly, Ramezani, Khabiri, Alvani, & Tondnevis (2011) point that role performance improves with level of education claiming that education does not influence occurrence of financial distress.

This thesis also reports that there is a positive significant relationship between CEO tenure and financial distress. The finding imply that CEO tenure positively influences the occurrence of financial distress; $H_4$was accept. The hypothesis read that there is a significant relationship between CEO tenure and financial distress. The findings contend findings by Barno (2017) who points that managers need to have a long tenure so that they can offer deeper understanding of the company's business. Similarly, Bhaiyat and Garrow (2015) propose that as the CEO office tenure increases the chances of default significantly declines implying that long tenure contributes to stability and efficiency of the firm. Equally, Herri, Johan, Handika and Yulihasri (2017)concluded that there is a direct relationship between CEOs characteristics and performance. They concluded that tenure in position favors performance. Additionally, Kariuki, Namusonge and Orwa (2015) in their research concluded that CEO tenure statistically significantly influences organizational size, growth and future opportunities. The study supports the argument that short-term tenure influences occurrence of financial distress. Kyenze (2014) adds that office tenure of the CEO affects the performance of the firm asserting that tenure is key determinant for future opportunities. The findings from this research could be different due to the fact that the studies were conducted in different settings as well as the data was different in nature and method applied.

Based on the analysis, there was an insignificant positive relationship between CEO experience and financial distress. The hypothesis that was tested was that there is a significant relationship between CEO experience and financial distress; the hypothesis H_5 was reject. The findings were not significant in explaining the occurrence of financial distress. However, Kariuki, Namusonge and Orwa (2015),found that CEOs who have extensive managerial experience in other industries significantly influence financial decisions implying that extensively exposed CEOs are more likely to remain steady, assertive in leadership even as they encounter problems. Therefore, firms that have volatile performance can benefit from well experienced and exposed leadership. Additionally, Vo & Phan (2013) and Wajiru (2013) equally add that working experience has a positive influence on performance of the firms asserting the need for experience in top management office in order to attain firm performance. Further, Getahun (2013) asserts that expertise is necessary to operate a firm so as to make informed decisions. Dauda and Hawa (2016) correspondingly reveal that skill influences performance. Dauda and Hawa emphasize that the top management office holders to possess adequate skills and wealth of knowledge of banking trend in order to provide leadership. Besides work experience, personal experience impact corporate financial decision making. According to Malmendier, Tate, & Yan (2011) the CEOs personal life experiences greatly influence decision making which ultimately is reflective of organizational performance Further, Larcker and Tayan (2017) opin that previous work experience and style are good forecast that inform future performance.

From the multi discriminant analysis, the canonical correlation was 0.516 indicating an effect size of 26.6% (0.516^2), implying that 26.6% of the variability of financial distress in commercial banks is determined by the changes in CEO age, gender, tenure, experience, and education. Additionally, the data was classified to either safe, grey or distress. The findings showed an overall classification of 75.8% by MDA, suggesting that a majority of the banks were correctly classified by the function (Distress 28.6%, grey 95.7% and safe 33.3%). The findings imply that MDA correctly classified data by 75.8%. Group centroids was also performed to establish the weight of each mean discriminant score for each group in the dependent variable for each of the discriminant function. The result

show that most of the cases were classified based on their group centroids. However, only one case was not grouped by the function. The group centroids had a high mean discriminant score of 75.8% of the classification. The findings confirm MDA classification.

5.3 Conclusions

This research provides both academics and practitioners with a different perspective of the effect of CEO attributes on financial distress in commercial banks in Kenya. The findings should help develop discussions for policy makers around governance issues, more specifically the term. Various studies have indicated a correlation between CEO attributes and firm performance. None of the studies however specifically looked at the correlation between CEO attributes and financial distress in commercial banks in Kenya. The research objectives were developed to guide the study from which research questions and hypotheses were drawn. The first objective was to assess the extent of financial distress in bank tiers in commercial banks in Kenya. To achieve the objective, secondary data was collected from commercial bank annual reports and financial statements. The data was validated and analyzed using Altman Z score model in order to classify banks into the different classification; safe, grey or distress. The model was selected due to its ability to reliably predict financial distress. The results from the model show that there is presence of financial distress at 18% among the Tier II and Tier III commercial banks.

The second objective of the study was to examine the significance of CEO attributes on financial distress in commercial banks in Kenya. Multi discriminant analysis was performed in order to obtain a model that can be employed to predict a single qualitative variable from many variables. Further, the discriminant analysis derives an equation as a linear combination factors of the independent variables that discriminate best between groups in the dependent variable component. The findings from this research show that MDA had majority of the banks correctly classified at 75.8%. Further, CEO tenure was found to influence the occurrence of financial distress. From the empirical analysis, there was evidence of correlation between CEO attributes and financial distress in Tier II and Tier III commercial banks at 26.6%.

Conclusively, the result of the study shows that there was presence of financial distress amongst commercial banks in Kenya in the year under study; 2016. The main CEO attributes that influenced financial distress was tenure supporting the upper echelons theory and agency theory. Other attributes: age, experience, education and gender were not considered as the main factors that influence financial distress.

5.4 Implication of the study

The prime of this thesis is to advance the research on effects of CEO attributes on financial distress in the context of commercial banks. Essentially, this study offers suggestions that contribute to the existing literature on financial distress. This section attempts to discuss the implications of the main findings.

5.4.1 Implication for commercial bank regulator

The CBK as commercial bank regulator should regularly monitor commercial banks in order to detect financial distress. The aim of detection is to safeguard stakeholders against loss and to avoid financial systemic failure that could cause panic to the public. Understanding the causes of financial distress allows amendment and inclusion of new regulations in monitoring of financial institutions especially those under CBK.

5.4.2 Implication for financial institution

The board of directors are advised to be cautious when setting the tenue of the CEO in order to avert financial distress. CEO tenure was found to be positive and statistically significant in determining financial distress. The findings suggest that the CEO tenure should not be too long. The result suggest that long period could encourage laxity and accountability problems which may lead to financial distress.

5.5 Limitations of the study

The secondary data covered one year (2016) during which some banks had been put into receivership, liquidated or merged. Although the study used census approach some commercial banks had to be excluded from the study due to incomplete data. Secondly, the study applied Altman Z-Score model to determine extent of financial distress, the findings were limited to this model.

5.6 Suggestions for further study

This research contributes to financial distress studies in Kenya. However, there are numerous areas that were not covered and form sources for further research. Some of the possible areas could include focus on other industry for example retail chains like supermarkets. Another study could focus on other models other than Altman Z-Score or combined in determining financial distress.

Another interesting area is having a longitudinal study rather than cross-sectional (one year). The study could help in understanding the trend of occurrence of financial distress. Additionally, financial and non-financial variables could be included in a study to determine their influence on financial distress.

Kenyatta University

Abstract

The Insurance industry in Kenya is very competitive, with the number of insurance companies as at December 2016 standing at 50. Despite this, the level of insurance penetration in the country is about 2.73%, which is relatively lower than the average world penetration rate of 6.28%. This study sought to investigate the influence of competitive strategies on insurance penetration in Kenya. The specific objectives included; investigating the influence of cost leadership, differentiation, focus strategy and critical success factors on insurance penetration in Kenya. The study adopted a descriptive and explanatory research design. The study was cross-sectional, with the use of both primary and secondary data. Primary data was collected by use of questionnaires with close ended questions. Data was collected from head of marketing and head of business development departments as they hold key information. Before collection of data, the questionnaire was tested for validity and reliability. Both tests confirmed that the questionnaire was valid and reliable for data collection. The data was analyzed using descriptive statistics, correlation analysis and regression analysis. The results of correlation analysis indicated that competitive strategies were positively associated with market share. The findings indicate cost leadership strategy positively and, company size had positive and significant influence on insurance penetration, implying that an increase in size had positive effects on insurance penetration. No evidence of moderation effect of critical success factors was found. The study concluded that adoption of cost leadership strategy enhances insurance penetration. Additionally, an increase in size of insurance companies enhances their ability to penetrate the market. The study recommends that insurance companies should seek strategies for cost efficiency in order to penetrate the market. Also, the insurance companies should seek growth opportunities.

Key words: ***competitive strategies, cost leadership, differentiation, focus, penetration***

1. INTRODUCTION

The insurance industry and financial sector in general play a crucial role in mobilization of funds. Insurance companies derive their income mainly from sale of insurance policies and deposit taking and subsequently investing this income. The global and local developments in the insurance industry are important in the development of policies in the sector. The global life insurance has significantly grown from 2.6% in 2012 to 5.4% in 2016, with non-life insurance stagnating between 3.0% and 2.4% in the same period (Ernest & Young, 2017). On average, the global growth in insurance has lagged behind global economic growth rate. Similarly, the global insurance penetration has decreased significantly over the last decade. Global penetration ratio in 2005 was 7.5% while in 2016 the ratio had fallen to 6.28% (Swiss Re, 2016). It has been indicated that stagnation in global economic growth has negative impact on insurance penetration (Ernst & Young, 2017). The global trend in insurance penetration is important because of the impact of globalization on the business world. The insurance penetration in Kenya is not impressive despite the importance of the insurance industry in mobilization of savings, deposits, capital markets, government securities and the real estate sector. The insurance industry in Kenya has relatively low penetration ratio, with the low income earners excluded from the services especially in the life insurance. By the end of 2016, the insurance penetration in Kenya was 2.73%, which is relatively lower than the average world penetration rate of 6.28% (IRA, 2017). There is stagnation in the insurance penetration in Kenya as is evident from the report by IRA (2017).

In light of the dynamics in the insurance sector, the relationship between competitive strategies and insurance penetration comes into question. In addition, the role of critical success factors in moderating this relationship should be investigated. Competitive strategies are techniques adopted by firms in order to sustain profits in the long-run mainly by strategically responding to competition. The main reason for formulation of competitive strategies is to link an organization with its environment (Porter, 1998). The nature and forces within the industry are most crucial aspects of an organization's environment. Therefore, competitive strategy can be viewed as the scope and direction taken by a company in the long-term that leads to competitive advantage (Yasar, 2010). Porter (1998) indicates that an organization can pursue three competitive strategies namely; cost leadership, differentiation and focus. Cost leadership strategy focuses on the efficiency by an organization. This strategy entails production and

distribution of goods and services at a relatively lower cost than competitors (Pulaj, Kume, &Cipi, 2015). Differentiation strategy entails uniqueness in products and services of an organization. The products and services of an organization pursuing this strategy should be easily distinguishable from the competing ones. On the other hand, focus strategy encompasses the practice of concentrating on a narrow market segment by organizations.

Critical success factors are the few areas in which satisfactory results would lead to success in the performance of an organization in a competitive environment (Rockart, 1979). According to Pal and Torstensson (2010), the critical success factors are effectively developed by planning and aligning of processes, products, and supply chains. It has been widely argued that measures of performance of an organization should reflect the critical success factors (Le Cornu and Luckett, 2004). Based on previous empirical and theoretical literature, this study will be confined to top management support, customer focus, technology, and employee orientation critical success factors. Top management support concerns the commitments and backing by executives in highest rank of an organization as key critical factors (Chiun, Wang, Wah & Ramayah, 2016). Customer focus is the orientation for meeting the needs of the customers by an organization. Employee orientation is the familiarization with new workplace environment. This is crucial in ensuring high performance in an organization. (De Bussy and Suprawan, 2011) found that employees were the most valuable stakeholders in an organization.

In business terms, penetration refers to the concept of aggressive actions that are aimed at expansion of total sales share in the market (Spann, Fischer & Tellis, 2009). Alternatively, market penetration measures the percentage of the market that is captured by the product or service (Wainaina and Oloko, 2015). On the other hand, insurance penetration is the ratio of direct gross insurance premiums to GDP. It represents the potential of insurance industry in a given country (Das and Shome, 2016). According to Olayungbo and Akinlo (2016), insurance penetration provides a robust measure of insurance activities. Generally, the insurance penetration measures the growth of insurance premium relative to GDP.

The insurance industry is important in an economy as it supports growth in many sectors of the economy. Despite the apparently impressive growth in the Kenyan insurance industry, insurance penetration has been relatively lower when compared to the global penetration rate. The global penetration rate stands at 6.28%. According to IRA (2016), insurance penetration rate declined to 2.73% in 2016, down from 2.88% in 2015.Basing on the data from IRA (2017), it is also evident that the penetration rate for Kenyan insurance industry has stagnated in the recent past. According to AKI (2016), insurance penetration in Kenya has declined from 3.44% in 2012 to 2.75% in 2016. In general, the relatively low insurance penetration rate in Kenya is an indication that majority of Kenyans have not taken insurance coverage. Against this background, this study intended to assess the link between competitive strategies and insurance penetration in Kenya.

A number of studies have focused on the factors influencing insurance penetration (Kamau, 2013; Njuguna and Kimani, 2016; Wairimu and Okibo, 2015; Das and Shome, 2016). Specifically, Kamau (2013) investigated the factors influencing low penetration of insurance products in Kenya while Njuguna and Kimani (2016) study focused on the financial factors affecting insurance penetration in Nakuru town. Wairimu and Okibo (2015) studied about the determinants of micro insurance penetration among Kenyan low and middle income earners while Das and Shome (2016) assessed the determinants of insurance penetration in India in a macroeconomic perspective. These studies have only focused on the determinants of insurance penetration, with lack of emphasis on the competitive strategies. In addition, the moderating role of critical success factors has not been assessed by these studies. In this perspective, this study sought to fill the existing research gap by investigating the competitive strategies influencing insurance penetration in Kenya. In addition, the moderation role of critical success factors was also investigated.

2. Literature Review

Previous theoretical and empirical literature was very important in shedding light on the business penetration, strategy and critical success factors. Porter's generic strategies, Boston consulting group matrix, and sales maximization theory were considered to be relevant theories.

2.1 Porter's Generic Strategies Theory

This theory was developed by Porter (1980) in his work about competitive strategies. Ideally, Porter (1980) describes competitive strategy as offensive taking or defensive measures to develop a position that is defendable in

an industry, and to successfully cope with the five forces of competition thereby getting superior investment returns. The five forces of competition in an industry comprise the competitors, suppliers, buyers, threats from substitutes and potential entrants. Due to the competitive forces in the industry, strategies to be adopted by organizations in order to successfully compete in the industry are proposed. These strategies include overall costs leadership, differentiation and focus. These strategies can be adopted singly or in combination. According to Porter (1998), the overall cost leadership strategy aims at achieving cost leadership in the entire organization through a set of practical policies designed to achieve this objective. Differentiation strategy involves differentiating the firm's product or service. On the other hand, the focus strategy involves focusing on a specific line of product segment, buyer groups, or geographic market.

2.2 Boston Consulting Group Matrix

The matrix was developed by Bruce Henderson in 1970s (Ionescu, 2011). The matrix analyses products into two dimensions. The first dimension assesses the general growth level of the product within the product's market. The other dimension measures the market share of the product in relation to the largest competitor in the market. An analysis of products using this approach provides an important understanding of the prospects and the product specific problems. The matrix groups products into four categories namely, stars, cash cows, problem child, and dog. The products in the star category have a high growth and a market share that is dominant. The implication for this is the requirement for significant investment in order to increase the market share, and to maintain their leadership over competitor's product (Debrecht and Levas, 2014). The cash cow category comprises products that have a high share in a low growth market. The strategy in this category is allocation of resources in order to protect market share and investment in product differentiation to track changes in consumer tastes. The products classified in the dog category have low market share in a market with low growth. The implication of this is loss/minimal profits from these products thereby draining an organization its resources and time. The best strategy for an organization is usually discontinuation in investing in the products in this category (Mohajan, 2017). Lastly, the problem child/question marks category is characterized by products with a low market share but in a high growth market. This is usually the case for the new products in the market. The new entrants have a high spending in order to increase the market share. Mohajan indicates that organizations in the question mark category have high marketing expenses, high competitive devices, high direct costs, narrow domains, high current assets levels, and big expenses in R&D. However, if an organization finds its existing products in this market category, then it should investigate the reasons behind this.

2.3 Sales Maximization Theory

Sales maximization theory is important because sales maximization is a strategy of market penetration. Sales maximization theory is based on the work by Baumol (1959). The objective of this theory was to assist decision makers in implementing business decisions that seemed to conflict with profit maximization principle. This theory is explained by use of two models, the static single-period model and a dynamic model for multiple periods. Ideally, it is not possible to concurrently pursue profit maximization and sales maximization. Profit maximization implies that a company must sell its products/services at a high profit margin. The cost of delivering the product or the service must be significantly lower than the sales price in case of profit maximization. The sales maximization principle on the other hand entails minimization of prices in order to increase sales. Baumol justifies sales maximization on a number of grounds. First, Baumol attributes the separation of ownership from management to reinforce the sales maximization desire by the managers. The discretion by the managers implies that sales maximization is the most obvious goal as long as the profits remain satisfactory. In addition, there is an argument that the earnings by the top management are more correlated with sales than profits. Baumol (1959) also explains that the theory of sales maximization is important because banks and other financial institutions keenly analyze the sales trends of organizations and they tend to lend to organizations that have sales growth. Next, this theory is justified on the basis of better employee earnings and terms of work. Generally, declining sales leads to layoffs and salary reductions. Also, the theory postulates that growth in sales reinforces the ability to adopt competitive strategies thereby strengthening the firm's competitive position.

2.4 Empirical Review

2.4.1 Differentiation Strategy and Penetration

There exists empirical evidence on the relationship between differentiation and penetration. Spencer and Joiner (2009) used a sample of 200 companies to assess the relationship between non-financial measures namely, market share, sales volume and market developments and differentiation strategy. By use of regression analysis, the authors report a positive and significant relationship between the non-financial measures and customer service differentiation. These findings are similar to the findings by Nolega, Oloko, Sakataka, and Oteki (2015) who found that customer base had increased sharply following the adoption of product differentiation by Kenya Seed Company. Dirisu, Iyiola and Ibidunni (2013) study also provides empirical backing on the relationship between penetration and differentiation study. Specifically, the authors used regression analysis in analysis of the effects of product differentiation on sales growth. The authors found a positive and significant relationship between product quality and sales growth. Kinyuira (2014) study focused on the relationship between items of performance (number of branches, employees, membership, total assets, and share capital) and differentiation strategy. By use of correlation analysis, the author found a positive correlation between the items of performance and differentiation strategy. On the other hand, Violinda, Dirgantara and Sufian (2016) study focused on the relationship between differentiation strategy and competitive advantage indicators namely; growth, financial performance, customer base, and internal business processes. Differentiation strategy was measured through six dimensions namely; product, service and support, personnel, channel and image. Using confirmatory factor analysis, the authors established a positive influence of differentiation strategy on competitive advantage.

2.4.2 Cost Leadership and Penetration

A number of studies provide empirical evidence on the influence of cost leadership on penetration. For instance, Hilman and Kaliappen (2014) found a positive and significant influence of cost leadership on organizational performance measures. The authors used regression analysis, with the items of organizational performance comprising market share, sales growth and customer base. The cost leadership indicators in this study included; lower cost of service, cost efficiency, reduction of costs required for service coordination, improvement of utilization of available equipment, facilities and services. Similarly, Gorondutse and Gawuna (2017) found that cost leadership had positive impact on competition in Nigerian hotel industry. Atikiya (2015) focused on the influence of cost leadership strategy on Kenyan manufacturing industry. By use of regression analysis, the author found a positive relationship between items of cost leadership and items of performance namely sales growth in the previous 5 years, sales in the previous 5 years, profit growth rate in the previous 5 years, growth rate in profits for the previous 5 years, profitability ratio over the past 5 years and overall organization performance.

2.4.3 Focus Strategy and Penetration

Cheptiram, Nzioki, and Njeje (2016) studied the relationship between focus strategy and the performance of seed companies in north rift region. The focus strategy in this study was proxied by market segmentation. Using correlation analysis, the authors found a positive association between market segmentation and organization performance. Asiedu (2016) linked focus strategy with bank performance. The authors Specifically, this study was based on market segmentation as a part of market focus strategy.The author used market share and profits to assess the impact of market segmentation on the performance of banks. Using deposit size, the author adopted Herfindahl Hirschman Index (HHI) in calculation of market concentration for the sampled banks and then correlation analysis between the index and the performance indicators was conducted. The correlation between the Herfindahl Hirschman Index and the performance indicators was calculated in order to establish the effects of market segmentation on the performance of the banks. The results of the correlation analysis indicated that market segmentation was positively correlated with market share. A different approach was taken by Arasa and Gathinji (2014). The authors used primary data to estimate the effect of focus strategy on organizational performance (proxied by market share and sales). By use of regression analysis, the authors found a positive and significant relationship between focus strategy and organizational performance.

2.4.4 Critical Success Factors and Penetration

There exists empirical evidence on the role of critical success factors in influencing business penetration. For instance, Cooper and Kleinschmidt (2007) used correlation analysis to assess the link between percentage of sales and critical success factors namely high quality process of new product development, organization, and firm

aggregate new product strategy, internal culture of the firm and innovation climate, and commitment by the senior managers. The authors found a positive relationship between critical success factors and sales. Another study that has attempted to link critical success factors with indicators of penetration is Aydin, Koc, and Kaya (2017). Specifically, the author studied the impact of critical success factors on business to business sales performance in Turkey. The critical success factors investigated comprised learning orientation, customer orientation, intrinsic motivation, hard-working scale and technical expertise. By use of regression analysis, the authors found that critical success factors influenced sales performance positively and significantly. Leszczynski (2016) studied critical success factors influencing customer base and general economic performance for women enterprises in Poland. The indicators of performance included change in number of customers, annual revenue from economic activity, and change in annual net profit or self-employment earnings. The author adopted regression analysis with the above measures as the dependent variables. The analysis results indicated that education, experience, above average entrepreneurial skills, and adoption of a defined competitive strategy were significantly and positively related with performance. AlQudah, Osman, and Safizal (2014) studied organizational performance critical success factors for SMEs in Jordan. Using a sample of 332 SMEs, the authors used regression analysis and correlation analysis to assess the relationship between the organizational performance and the critical success factors of quality circle and performance appraisal. The regression analysis indicated that the coefficients of quality circle and performance appraisal were positive and significant, implying that critical success factors had a positive influence on organizational performance.

2.5 Summary of Literature

From the reviewed literature, it is evident that in most cases competitive strategies influence the market penetration of organizations. A number of studies reviewed found that differentiation, cost leadership and focus strategies had positive and significant influence on penetration indicators such as market share, sales, turnover growth and customer base (Spencer and Joiner, 2009; Nolega et al.,2015; Dirisu et al., 2013; Gorondutse and Gawuna, 2017; Cheptiram et al., 2016). However, research gap exists in that no study reviewed has focused on insurance penetration. Some of the studies also have used ANOVA to investigate the differences in performance in various generic strategies and hence there is no causal relationship established.

3. Research Methodology

3.1 Research Design

This study adopted descriptive and explanatory research designs. Descriptive research was important as it formed the basis of other research designs. A good description of observations was important because it helped in discovery of special data characteristics that provoked the adoption of other methods of analysis such as correlation and regression. The descriptive research design was important in this study as it formed the basis of explanatory research. On the other hand, explanatory research design was used in order to test the influence of competitive strategies on insurance penetration.

3.2 Target Population

Target population is the entire group of individuals or objects to which the research findings are generalized. Any inferences from a sample should be based on a well-defined population. In defining target population, inclusion and exclusion criteria should be developed. The research problem and objectives guide on the exclusion and inclusion criteria (Banerjee and Chaudhury, 2010). The target population in this study comprised all the registered insurance companies in Kenya. The population was established from the Insurance Regulatory Authority published reports on insurance sector. According to IRA (2017), there are 50 registered insurance companies in Kenya. These formed the target population.

3.3 Sample Size and Sampling Technique

A sample can be defined as the subset of individuals, elements or objects that represents a given population. Due to the small number of population (50 registered insurance companies), census was used. Census allows for collection of relatively more information than sampling. This is because census allows for an intensive research about a particular problem. Also, a relatively higher degree of accuracy is achieved by a study based on census especially

when the population is small. The respondents in this study were the departmental heads of the insurance companies in Kenya. The departmental heads from marketing and business development department were the respondents in this study.

3.4 Data Sources and Collection Techniques

This study used both primary and secondary data. Secondary data was mainly insurance penetration and total asset value data (representing the company size). Penetration data was collected from financial reports and the Insurance Regulatory Authority reports on insurance industry. Primary data was collected by use of semi-structured questionnaire. The questionnaires were administered by conducting interviews to the departmental heads of business development department of the sampled companies. The departmental heads were selected as respondents because it is believed that they have substantial information about the strategic orientations of their organizations as well as vital information in insurance industry.

3.5 Validity and Reliability of Research Instruments

3.5.1 Pilot testing

Pilot testing was conducted in order to ensure that the questionnaire is valid and reliable tool for data collection. Pilot testing is also important as it offers the opportunity to improve research design in case some shortcomings are discovered during the exercise thereby saving time and resources. Following the work by Kothari (2004), a sample size of 10% of the insurance companies was used in the pilot testing. Simple random sampling was used to select the respondents. The insurance companies used in the pilot testing were left out from the final study.

3.5.2 Validity of the instruments

Validity can be termed as the extent to which a research instrument measures what it purports to measure if efficiently administered (Oladimeji, 2015). According to Karras (1997), validity is measured by association strength or correlation between established findings and a criterion measure. This is referred to as criterion-related validity. However due to the lack of standardized external criterion on which to assess criterion-related validity, this study relied on the opinion of scholars in the strategic management field.

3.5.3 Reliability of the Instruments

Reliability is the situation in which the results from a test are consistent, stable, and when repeated similar results are derived (Oladimeji, 2015). The reliability implies similar results are derived under the same situations but different settings. Reliability indicates whether there is consistency in performance of questionnaire. Two main approaches to examination of the questionnaire reliability exist. The first approach involves testing whether the same results are yielded by a questionnaire when administered to the same person on separate occasions. The second approach involves administering the same questionnaire to the same person by two different interviewers and then assessing the correlation of the results. Statistically, the reliability in this study was measured by use of Cronbach's alpha. In this test a score of more than 0.7 is considered acceptable, otherwise the questionnaire is deemed to be unreliable.

3.6 Data Collection Procedures

The researcher personally administered the questionnaires as this offered the opportunity to probe on some items of variables of interest. On the other hand, secondary data on penetration was sourced from financial reports and market surveys of the sampled insurance companies and IRA. Before data collection, authorization was sought from the sampled companies. A copy of the letter of introduction that had been signed by the university was availed to all the insurance companies under the study. In addition, consent was sought from the respondents before data collection.

3.7 Data Analysis and Presentation

The data that was collected was quantitative in nature. The responses on competitive strategies and critical success factors were tabulated and coded. The methods of data analysis comprised descriptive analysis, correlation analysis, and regression analysis. Specifically, correlation analysis was used to analyze the association between quantitative data on market share, competitive strategies, critical success factors and company size. On the other hand, descriptive analysis was used in calculating the descriptive statistics for the variables. The descriptive statistics comprised mean, skewness, and kurtosis. Lastly, a multiple regression model was used to assess the impact of competitive strategies on insurance penetration. The critical success factors were the moderating variable in this model. The model was estimated by use of OLS method and took the following form;

$$Y = \beta_0 + \beta_1 X_1 + \beta_2 X_2 + \beta_3 X_3 + \beta_4 X_4 + \beta_5 X_5 + \mu \quad \text{.....Equation 1}$$

Where, β_0 = regression constant, $\beta_1 - \beta_5$= regression coefficients, X_1= cost leadership strategy, X_2= Differentiation strategy, X_3= Focus strategy, X_4= Critical success factors, X_5= Company size

It is hypothesized that critical success factors enhances the relationship between the competitive strategies and insurance penetration and hence a second model was used to test the moderation effect of critical success factors. Basing on Whisman and McClelland (2005) the model for testing moderation is as indicated in equation 2.

$$Y = \beta_0 + \beta_1 X_1 + \beta_2 X_2 + \beta_3 X_3 + \beta_4 X_4 + \beta_5 (X_1 * X_4) + \beta_6 (X_2 * X_4) + \beta_7 (X_3 * X_4) + \beta_8 Size + \mu \quad \text{.....Equation 2}$$

Where X_4= Critical success factors (moderating variable), $(X_1 * X_4)$, $(X_2 * X_4)$, $(X_3 * X_4)$= interaction terms Size=company size

To test the moderation of critical success factors (X_4), interaction terms($X_1 * X_4$), ($X_2 * X_4$) and ($X_3 * X_4$) are added to the model as indicated by equation 2. In this case, moderation exists if the coefficients for the interaction terms ($\beta_5, \beta_6, \beta_7$) in equation 2 are statistically different from zero (Andersson, Cuervo-Cazurra, & Nielson, 2014). Therefore, if the moderation exists, the interaction terms should be significant. At 5% level of significance, the p-values of the coefficients of the interaction terms should be less than 0.05.

3.8 Diagnostic Tests

Before estimation of equations 3.1 and 3.2, tests for normality, multicollinearity, and heteroskedasticity were conducted. Heteroskedasticity test was carried out by use of Whites General test. Heteroskedasticity arises when the variance of error term is not constant across observations thus violating the OLS assumptions. On the other hand, Jarqua-Bera test was used to test the hypothesis of normal distribution in the dataset. Multicollinearity between the independent variables leads to bias in hypothesis testing and hence wrong inferences are made. This was tested by use of variance inflation factors.

4. Data Analysis, Interpretation and Discussion

4.1 Response Rate

Of the 50 companies contacted, a total of 37 agreed to participate in the study. This represented a response rate of 74%. This response rate was deemed to be adequate representation of the population that was being studied. In an analysis of 1607 articles focusing on organizational research, Baruch and Holtom (2008) found that the average response rate was 52.7 percent.

4.3 Reliability Tests

Internal consistency, a measure of reliability of the questionnaire was tested using the Cronbach's alpha for the three competitive strategy variables and critical success factors. The results indicated that the questionnaire was reliable as the Cronbach's alphas for all the competitive strategies and critical success factors were more than the critical value of 0.7.

4.4 Demographic Information

4.4.1 Age and gender of respondents

The study sought to evaluate the gender and age of respondents. The findings are presented in Table 1.

Table 1: Age and gender of respondents

Gender	Age					
	31-35	36-40	41-45	46-50	51-55	Total
Female	2 (17%)	8(67%)	1 (8%)	1(8%)	0(0%)	12 (100%)
Male	3(12%)	9(36%)	7(28%)	5(20%)	1(4%)	25(100%)
Total (male and female)	5(13%)	17(46%)	8 (22%)	6(16%)	1(3%)	37 (100%)

The results in table 1 indicates that majority of the respondents were male. This implies that male managers are majority in the insurance industry and more work needs to be done to ensure gender equity in line with the Kenyan constitution. These findings corroborate the findings by Maina and Iravo (2015) and Mwangi and Ombui (2015). These studies found that the percentage of male employees in managerial positions was higher than that of female employees.

4.4.2 Age and experience of the respondents

The study sought to investigate the age and experience of the respondents. The results are summarized in Table 2.

Table 2: Age and Work Experience of the Respondents

	Work Experience				
Age (years)	1-5	6-10	11-15	16-20	Total
31-35	1	4	0	0	5
36-40	1	14	2	0	17
41-45	1	5	2	0	8
46-50	0	4	1	1	6
51-55	0	1	0	0	1
Total	3 (8%)	28 (76%)	5 (13%)	1 (3%)	37 (100%)

The findings in Table 2 suggested that majority of the respondents had experience of 6 to 10 years in the insurance sector. This represented 77% of the sampled respondents, with respondents between 36 to 40 years being the majority (14). A study by Maina and Iravo (2015) established that majority of employees in managerial position were more experienced than employees from lower level positions. The authors concluded that managerial position requires people with work experience. Ombui (2015) found that majority of the management level employees were middle aged and had vast experience in strategy formulation and implementation.

4.5 Descriptive Statistics for the Variables

Descriptive statistics for the dependent and independent variables were calculated in order to describe the basic features of the data. The results are shown in Table 2.

Table 3: Descriptive statistics

Descriptive statistics for the dependent and independent variables were calculated in order to describe the basic features of the data thereby allowing for simpler interpretation of the data.

	Cost leadership	**Differentiation**	**Focus**	**Critical success factors**	**Market share**	**Size**
Mean	2.216216	2.604324	2.405405	2.54054	2.703784	15.14447
Std. dev	1.227806	0.8873385	0.9562502	1.104183	2.364946	0.7404216
N	50	50	50	50	50	50
Obs	37	37	37	37	37	37

According to the results in Table 3, it can be concluded that the cost leadership strategy is generally used to a little extent by the sampled insurance companies. Specifically, the mean of cost leadership strategy was 2.2, implying that the cost leadership strategy on average was being used to a little extent. Similary, the focus strategy is used to a little extent by the insurance companies as indicated by a mean of 2.4. Differentiation strategy had a mean of 2.6, implying that the insurance companies used this strategy to a moderate extent. These results concur with Kowo, Sabitu and Adegbite (2018) findings that respondents believed that differentiation had moderate influence on sales turnover. On the other hand, critical success factors had a mean of 2.5, implying that on average, the respondents believed that the four critical success factors had moderate importance in influencing the market share. These findings are consistent with AlQudah (2014) who found that critical success factors had moderate influence on organizational performance. The mean market share was 2.7, implying that the average market share for the sampled companies was 2.7 per cent.

4.6 Correlation Analysis

The study sought to evaluate the strength and direction of association between the study variables. Correlation analysis between the variables is shown in Table 4.

Table 4: Correlation Analysis

	1	**2**	**3**	**4**	**5**	**6**
1.Market share	1					
2.Cost leadership	0.8791** 0.0000	**1**				
3.Differentiation	0.8562** 0.0000	0.8367** 0.0000	**1**			
4.Focus	0.3273* 0.0480	0.3491* 0.0342	0.2382 0.1558	**1**		
5.Critical success factors	0.6475** 0.0000	0.5034* 0.0015	0.5421** 0.0005	0.3733* 0.0229	**1**	
6. Company Size	0.8745** 0.0000	0.8005** 0.0000	0.8443** 0.0000	0.2496 0.1362	0.4809* 0.0026	**1**

$* P < 0.05, \quad ** P < 0.01$

Table 4 summarizes the correlation between the strategy variables, company size and market share. The cost leadership, critical success factors and company size have a positive association with the market share, with the association between these variables and market share being significant at 1% level of significance. The focus strategy was also found to be positively correlated with market share. The correlation was however significant at 5% level of significance. In addition, the above results indicate that focus strategy is weakly correlated with market share. These results suggest that the competitive strategies and critical success factors are associated with the market share. Thus, adoption of the competitive strategies is associated with an increase in the market share and hence insurance penetration. Generally, the positive and significant correlation between the independent variables (cost leadership strategy, differentiation strategy, focus strategy, company size, and critical success factors) and dependent variable (market share) implies that there exists degree of linear relationship between the variables. These results support the findings of Buul and Omundi (2017) who found that cost leadership, focus and differentiation strategies had positive and significant association with sales growth. Similary, Atikiya (2015) found a positive association between sales growth and cost leadership strategy in manufacturing firms in Kenya.

4.7: Regression Analysis

The regression analysis was used to assess the effect of competitive strategies on insurance penetration. Two models were estimated. The first model was the base model. The second model was the model for testing whether critical success factors moderated the relationship between competitive strategies and market share. In addition to the competitive strategies, company size was used in the model as the control variable. Before regression analysis, diagnostic tests were carried out to ensure the validity of the model. Multicollinearity test was carried out by use of variance inflation factor. The test indicated that there was no multicollinearity. Normality test was carried out by use of Jarque-Bera test. The test indicated that the residuals from regression were normally distributed. On the other hand, visual inspection of scatter plot graphs indicated that the relationship between the market share and the independent variables depicted a linear trend.

4.7.1 Base Model

The base model was in the following form;

$$Y = \beta_0 + \beta_1 Costleadership + \beta_2 Differentiation + \beta_3 Focus + \beta_4 CSF + \beta_5 Size + \mu \quad \ldots\ldots\ldots\ldots\ldots\ldots 3$$

Where; CSF=critical success factors, size=company size

The regression results are summarized in Table 5.

Table 5: Regression results

Dependent variable: Market share

Number of observations=37

Variable	Coefficient	Std. Error	t-statistic	Prob.
Cost Leadership	0.7112151	0.2584499	2.75	0.010
Differentiation	0.4259137	0.3840396	1.11	0.276
Focus	0.1062465	0.1744681	0.61	0.547
CSF	0.1754972	0.1807105	0.97	0.339
Size	1.280477	0.414278	3.09	0.004
Constant	-19.98034	5.619941	-3.56	0.001
R Squared 0.8667 Adjusted R Squared 0.8452				

F Statistic 33.74
Prob.>F 0.0000

From the above regression results, the model is valid because its overall slope is significant at 1% level of significance. This is because the p-value of the F-statistic is less than 0.01. In addition, the model has high explanatory power. The R-squared of 0.8667 suggests that approximately 87% of the variation in the dependent variable (market share) is explained by the five independent variables.

The regression results in Table 5 indicated that there was a positive and significant relationship between cost leadership strategy and market share (proxy for insurance penetration). In addition the size of the company was found to have a positive and significant relationship with market share. The coefficients for both cost leadership strategy and size of the company were significant at 1% level of significance. This is because the p-values for coefficients of these variables were less than 0.01. The implication for this is that cost leadership strategy and size of the organization positively and significantly influences insurance penetration in Kenya. Similar findings were established by Atikiya (2015). Specifically, the author found that cost leadership strategy had positive and significant influence on sales growth and profit growth. The findings also corroborate those of Buul and Omundi (2017) who found positive and significant relationship between cost leadership strategy and performance of organizations. Therefore, adoption of cost leadership strategy would enhance insurance penetration. Achieving cost leadership enhances organization's profit and hence the ability to penetrate the market. This implies that adoption of the cost leadership strategy would lead to an increase in market share for the insurance companies and hence market penetration (Hilman & Kaliappen, 2014; Gorondutse & Gawuna, 2017).

Also, the larger the insurance company (as measured by the asset base) the greater will be its penetration ability in the market. This claim is supported by Fiala and Hedija (2015) who found a positive and significant relationship between firm size and firm growth. Leitner and Guldenberg (2009), also found evidence of positive effects of company size on market share. This implies that the larger the company, the greater will be its potential for market penetration. The coefficients for the differentiation strategy focus strategy and critical success factors were insignificant although their signs were positive as expected**.**

4.7.2 Testing Moderation

Regression based technique was used to test whether critical success factors moderated the relationship between competitive strategies and market share. This regression model involved inclusion of interaction between the competitive strategies and critical success factors (interaction term). The model estimated has been discussed was in the following form:

$$Y = \beta_0 + \beta_1 Cost\ leadership + \beta_2 Differentiation + \beta_3 Focus + \beta_4 CSF + \beta_5 (Cost\ leadership * CSF) + \beta_6 (Differentiation * CSF) + \beta_7 (Focus * CSF) + \beta_8 Size + \mu \ldots\ldots\ldots\ldots\ldots\ldots 4$$

Where CSF = Critical success factors (moderating variable), $(Cost\ leadership \times CSF))$, $(Differentiation \times CSF)$, $(Focus \times CSF)$= interaction terms

Table 6 summarizes the results for moderation model.

Table 6: Regression for testing moderation

Dependent Variable: Market Share

Number of Observations: 37

Variable	Coefficient	Std. Error	t-statistic	Prob.

Cost leadership	0.7669065	0.5469041	1.40	0.172
Differentiation	-0.581035	0.5500072	-1.06	0.300
Focus	0.3540307	0.3333728	1.06	0.297
CSF	-0.1581639	0.1853469	-0.85	0.401
Cost*CSF	-0.0593629	0.3166507	-0.19	0.853
Diff*CSF	0.418187	0.3468173	1.21	0.238
Focus*CSF	-0.1916276	0.1335636	-1.43	0.162
Size	1.317972	0.3671809	3.59	0.001
Cons	-19.10112	4.903314	-3.90	0.001
F Statistic 37.33 Prob.> F 0.0000 R-Squared 0.9143 Adj. R-Squared 0.8898				

The regression results in Table 6 above suggest that the model has high goodness of fit. The R-squared of 0.9143 implies that the independent variables in the model had high explanatory power. However, the coefficients for interactions terms were insignificant since the p-values were more than 0.05 (P>0.05). Therefore, no evidence of moderation by critical success factors was found. The findings from the current study do not corroborate Acquaah and Agyapong (2015) findings that managerial and marketing capabilities moderated the relationship between competitive strategies and firm performance. However, the study by Acquaah and Agyapong focused on SMEs in general. In addition, the authors focused on different critical success factors.

5. Summary, Conclusion and Recommendations

The main objective of this study was to investigate the influence of the competitive strategies on the insurance penetration in Kenya. The competitive strategies comprised cost leadership, differentiation, and focus strategies. On the other hand, market share for the sampled companies was used as a proxy for insurance penetration. The study findings suggested that the cost leadership strategy had a positive and significant effect on the market share and hence insurance penetration. This means that the more the insurance organization is able to achieve cost leadership, the greater will be its ability to penetrate the market. The study findings also indicated that the company size had a positive and significant influence on the insurance penetration. This implies that as organizations grow so does their ability to penetrate the market.

The study concludes that the costs incurred by the insurance organizations in the country influences their market penetration ability. In this case, achieving cost leadership is an essential component that would significantly enhance insurance penetration. Similar to Leitner and Guldenberg (2009), the size of an organization is an important determinant of its ability to penetrate the market.There appears to be no significant influence of focus strategy and

differentiation strategy on market penetration. This could be conceptualized to imply that the services that insurance companies offer are limited, with little differentiation in the insurance products.

The study recommends costs monitoring by the insurance companies. Achieving cost leadership enables insurance companies to expand their markets with relatively lower costs as compared to their competitors. The policy makers in the government also need to promote the growth of insurance industry by coming up with policies that lower the costs in insurance industries. Generally these policies should foster ease of doing business in the insurance industry. Owing to the significant influence of company size on market share, it is important for insurance organizations to identify growth opportunities. Identification of growth opportunities is important for organization to increase their market share. In addition, identification of growth opportunities enables organizations to increase their size and hence the ability to penetrate the markets.

Effects Of Entrepreneurship Training On Financial Performance Of Small Scale And Medium Enterprises In Nairobi City, Kenya

Charles Omwanza Odongo

Abstract

Performance of SMEs in Kenya is currently wanting despite the national and county governments' campaign to educate their young entrepreneurs and women on entrepreneurship skills. Most SMEs still lack the crucial entrepreneurship skills on savings and borrowing, investment, financial analysis skills, and innovation. The study therefore seeks to examine effects of entrepreneurship training on financial performance of small scale and medium enterprises in Nairobi City County of Kenya. The specific objectives will be to determine effects of saving and borrowing, investment, financial analysis skills, and innovation on financial performance of SMEs in Nairobi City County. The study will use a descriptive research design. Primary data on entrepreneurship training will be collected from SMEs managers and owners while secondary data on performance will be collected from their financial statements or records. A stratified sampling technique will be used to select 70 SMEs from the CBD of Nairobi area. Statistical package for social scientist (SPSS) will be used in data analysis to establish the relationship between study variables.

Introduction

The chapter discusses the background of the study, statement of the problem, research objectives, research questions, research assumptions, justifications of the study, significance of the study, scope and delimitations of the study, and limitations of the study.

1.1 Background to the Study

Small and Medium Enterprises (SMEs) play significant role in the growth and development, both in the developed and the developing economies. The World Bank report (2017) confirms that the formal SMEs account for over 60% of employment in these economies and 40% of the Gross Domestic Product (GDP). The informal SMEs also have crucial contribution to employment and GDP of these economies. Daka (2001) emphasises that having realized the significance of entrepreneurship training on the performance of SMEs, several countries such as Brazil, Singapore, United Kingdom, India, USA, Latin America, Poland, and Malaysia among others have introduced entrepreneurship education programs since 1990.

In Africa, limited research has been done in this area, especially with reference to financial performance of SMEs. In some countries, entrepreneurship training is a new idea. Nigeria is considered the world's leader in the entrepreneurial initiative, which is attributed to the effectiveness of investment in entrepreneurial education (Global Entrepreneurial Monitor, 2012). As such, it is important for other countries across the globe and in Africa to follow suit by promoting and supporting entrepreneurial training on the financial performance of SMEs. Therefore, this proposal seeks to explore the effects that the entrepreneurship trainings will have on the ability of the firms to pay their debts when they fall due, to give competitive return to investors, the efficiency in the use of capital, the manner in which funds are invested and ability to plough back profits for expansion of the businesses.

Some of the roles of SMEs globally include employment and wealth creation, a source of tax revenue for the government, development of the private sector, meeting local and international demand among others. As a means of strengthening the country's economy, the government of Kenya, Non-Governmental institutions, investors and other key players in the economy continue developing financial and no-financial strategies and programs with a view of promoting the development of SMEs (Kithae, Magambo & Kavinda, 2012). One of the major such programs is the entrepreneurship training and education. Despite all these interventions, many SMEs do not live to see their fifth birthdays, thus raising the question on the nature of the effects of the training on the performance of SMEs (Munene, 2013). Over 60% of the SMEs shut down their operation within the first few months (Kenya

National Bureau of Statistics, 2007). Arinaitwe (2006) asserts that the rate of failure is higher in developing countries than in the developed countries.

1.1.1 Entrepreneurship Training

Entrepreneurship training is an important necessity to the development and growth of the Small and Medium Enterprises (SME) sector globally. It is an important tool for changing people's perception and to transfer skills necessary for entrepreneurs. Global Entrepreneurship Monitor (GEM) explains that the main factor that hinders entrepreneurship is lack of education on entrepreneurship and further reiterates that Africa has the least supportive entrepreneurial framework conditions (GEM, 2018). Evaluation of the influence of entrepreneurship training provides important feedback to the stakeholders as it assesses how the training has the impacted the life of the trainees (Philips & Philips, 2016).

Entrepreneurship training involves financial literacy, which is as a set of skills and knowledge, which enable individuals to make informed decision about finances. Financial literacy is deeper than knowledge because it also incorporates active management of a person's money right from accumulation to consumption. It is increasingly becoming more important than before as financial institutions, financial professionals and educators, and others from Kenya are identifying financial analysis to be a priority (Cude, 2010).
Entrepreneurship training benefits people of all categories of income and ages. For entrepreneur who is starting their own enterprises, it is a tool for providing savings, investments, borrowing skills. It also enables consumers to budget and save so that expenses are kept under control. In a study conducted by Eularia (2009) in Nyamagabe District, Rwanda, it was reported that many people often overrate their financial position, and therefore financial literacy makes sure that individuals have a realistic view regarding their own financial knowledge of and understanding of investment and financial decisions. Entrepreneurship training helps entrepreneurs get discipline to save money for businesses, their own use, and education (Behrman, Mitchell, Soo, & Bravo, 2010). It helps people ensure that they have adeequate savings and provide them with skills and information for making wise investment choices, saving plans, budgeting, and recordkeeping. It enables people with lower income levels to make the most of whatever they are able to save for investment to avoid incurring higher costs of borrowing, i.e the high interest rates charged by non-financial institutions (Swee Lian, 2008). It means that a person's level of financial literacy may impact his or her quality significantly. As a compotent of entrepreneurship training, financial education enhances one's ability to provide for oneself and that of his/her family, saving for the future goals and investments. It promotes financial analysis practices among idividuals and groups. Financial education also reiforces timely settlement of bills and preventing overidebtess to facilitate access of loans in credit markets.

1.2.1 Entrepreneurship Training and Small Scale and Medium Enterprises

Small scale and medium enterprise can excel in their enterprises by their effectual and competent engagement in entrepreneurial training activities. Entrepreneurship training indicators such as training methods, programme content, learner characteristics, and facilitator positively correlates performance of enterprises (Davis, 2012). The training provides women entrepreneurs with knowledge, skills, resources, and potential to start and manage their businesses. Trained women acquire knowledge on accessibility of credits, savings, funding agencies, certification procedures, financial management, innovation, technical skills, motivation, and support from their families,

government as well as other organisations (Hesse-Biber, 2013). Hence, formation and strengthening of SMEs need to be encouraged.

Entrepreneurship training constitutes trainings that provide lectures and produce materials imparting technical knowledge in production, processing, management, procurement as well as marketing (Dalal, 2011). The move aims to motivate entrepreneurs to participate in micro-entrepreneurship and with the right assistance, specifically youth and women entrepreneurs are able to strengthen their potentials as they add to their family income and promote national productivity.

Kithae, Magambo, and Kavinda (2012) entrepreneurship training is geared towards providing necessary knowledge, skills, and attitudes that are important for the starting up or expansion of business enterprises in the country. It is upon this background that the government made it part of the curriculum for primary, secondary and tertiary institutions of learning. As to whether the training have a played a role in the performance of SMEs in the country is still a debate. Mayuran (2016) did a study in Jaffna District in Sri Lanka to determine the impact of entrepreneurship training on performance of small enterprises using such variables as customer service training, marketing, financial management. The author found out that the entrepreneurship training had contributed to about 85% of these firms performance, with financial management knowledge having the greatest contribution. According to Aderyemi (2007), there is a positive relationship between entrepreneurship training and their performance through their transformation into larger enterprises.

1.1.2 Financial Performance of SMEs

Performance is understood in terms of output, which is the level of achievement of quantified objectives. Performance comprises measurements of results of a firm's policies as well as operations in monetary terms (Berríos, 2013). The outcomes are shown in a firm's value-addition, assets, and returns. The researcher emphasizes that accounting measures are the foundation of quantitative approaches to a firm's performance measurement. Financial performance provides measures of outcomes of a company's policies as well as operations in monetary terms. According to Ravi and Sharma (2012), financial performance is perceived as a measure of a firm's ability to generate some level of income stream over a specified duration. The author emphasizes that the recommended measures of financial analysis, which demonstrate a company's financial performance, are categorised into five broad groups, including profitability, solvency, liquidity, financial efficiency as well as repayment capacity. The predictors of financial performance comprise sales growth, net income (NI), operational efficiency, earning per share (EPS), return on sales (ROS), return on assets (ROA), return on equity (ROE), and return on investments (ROI) (Stiglitz, 2011). A profitable firm earns a positive net income.

According to Rahaman (2010) measures of financial performance vary significantly. In traditional management studies, financial ratios are grouped according to the performance aspects of liquidity, financial performance, and leverage. Information gathered from financial statements can be used in calculating the ratios. Financial performance measurements are crucial in monitoring a firm's return on capital employed (ROCE) in the business (Kiaritha, 2015)

CBK (2017) in its annual supervision report highlighted that the microfinance banks had an overall decline in their financial performance, reporting a total loss before tax of KES 622 million for the period ended 31 December 2017. The reported performance indicated a reduction from the financial performance reported in the year ended 31 December 2016, in which the microfinance sector posted a loss before tax of KES 377 million (CBK, 2017). The deterioration in profitability of the microfinance sector was majorly linked to decrease of financial income by 7% (KES 1 billion). The reduction in the financial performance made the sector report a lower return on assets (ROA) and equity ratio at negative (-) 0.9% and negative (-) 5.5%, compared to year 2016 at -0.5% and -3.2% respectively. The poor financial performance of the microfinance sector was also attributed to reduction in client deposits by 3.2% from KES 40.2 billion (in 2016) to KES 38.9 billion (in 2017) (CBK, 2017). The reduction in deposits was associated with growing demand from clients for higher interest returns, while experiencing stiff competition from commercial banks as they execute the law on interest capping (CBK, 2017). The net loan portfolio decreased by 8.9% from KES 47 billion (in 2016) to KES 42.8 billion (in 2017). The decline of the loan book was partially linked to the deliberate attempt by most financial institutions to cut lending because of the uncertainties linked to the electioneering period and partially by the interest rates-capping that led to a shift in clients to cheaper financial products from commercial banks.

1.2 Statement of the Problem

Achieving financial growth has been a difficult task for most SMEs in Kenya, resulting in poor financial performance. Studies have cited a gap in the entrepreneurship training that has led to poor performance. It is therefore necessary to investigate effects of entrepreneurship training on financial performance of SMEs in Kenya. Entrepreneurship skills are critical to modern day organizations even for SME sector. In simple terms and with reference to a business, it is the capability of an organization to deliver products or services to its customers in the most cost-effective manner possible while still ensuring the high quality of its products, service and support. It is achieved by streamlining a company's core processes so that it can effectively respond to continually changing market forces in a cost-effective manner. In order to attain financial growth an organization needs to minimize redundancy and waste while leveraging the resources that contribute most to its success and utilizing the best of its workforce, technology and business processes. The reduced internal costs that result from operational efficiency and growth enable a company to achieve higher profit margins or be more successful in highly competitive markets Attaining financial growth is a major challenge to SMEs in Kenya for even the most ambitious organizations. It is seen through entrepreneurship training, number of customers served, infrastructure, managerial quality, and geographical coverage (Olongo, 2013). A persistent problem has been how to achieve financial performance in

SMEs through entrepreneurship training (Cull, Kunt & Morduch, 2010). The problem has attracted attention of numerous researchers in recent past and as a result many strategies have been put in place to ensure operational growth (Maaka, 2013). Therefore, the need for SMEs to be operationally and financially sustainable in order to provide microfinance facilities and contribute to poverty reduction is very critical (Kimari, 2013). Only those SMEs which are operationally and financially stable stand a chance of reaching the vast millions of the poor (Nyanga, 2012).

In Kenya, limited empirical literature is available on this topic. Kisaka (2014) carried out a research on the impact of education and training on the entrepreneurial behaviour and found out that there exists a strong positive relationship. Munene (2013) also carried out a research on the impact of entrepreneurship training on the performance of SMEs in Nakuru County and found that there is a correlation between these variables. He measured the performances using pricing tactics, book keeping practices, up-to-date loan repayments, product quality, and customer satisfaction without investigating the financial performance. A similar study was carried out by Kithae, Maganjo and Kavinda (2012) in Embu municipality. The study also found a strong positive correlation between entrepreneurship and performance of SMEs. The performance of the firms investigated were measured in terms of their ability survive by coping with the hostile business environment, but did not measure the financial performance of these firms.

Empirical literature in this area provides evidences mostly outside Nairobi County, which houses over 70% of the SMEs in Kenya thereby may not be a true representation of the actual relationship (Njambi, 2016). The performance of the SMEs is also measured in non-financial terms. There are limited researches done with respect to the financial performance of the SMEs. While taking into considerations the lack of empirical data on the effects of entrepreneurship training on financial performance, the researcher will attempt to work on such untouched evidence.

1.3 Research Objectives

The overall objective of this study is to examine effects of entrepreneurship training on financial performance of small scale and medium enterprises in Nairobi City County of Kenya

1.3.1 Specific Objectives

The study will be guided by the following specific objectives:

i. To determine whether the understanding of savings and borrowings influence financial performance of small scale and medium enterprises in Nairobi City County of Kenya.

ii. To ascertain whether understanding of investment influence financial performance of small scale and medium enterprises in Nairobi City County of Kenya.

iii. To examine whether financial analysis skills influence financial performance of small scale and medium enterprises in Nairobi City County of Kenya.

iv. To ascertain determine whether innovation influence the financial performance of small scale and medium enterprises in Nairobi City County of Kenya.

1.3.2 Research Hypotheses

The study will be guided by the following research hypotheses:

i. Ho_i: knowledge in savings and borrowings has no influence on financial performance of small scale and medium enterprises in Nairobi City County of Kenya

ii. Ho_{ii}: Knowledge in investment has no influence on financial performance of small scale and medium enterprises in Nairobi City County of Kenya

iii. Ho_{iii}: Financial analysis skills has no influence on financial performance of small scale and medium enterprises in Nairobi City County of Kenya

iv. Ho_{iv}: innovation has no influence on financial performance of small scale and medium enterprises in Nairobi City County of Kenya

1.4 Significance of the Study

The study seeks to benefit the following category of people:

1.4.1 Research and Academicians

The findings in this study will make contributions to existing knowledge on SME sector and further studies in the subject of critical success factors for small and medium enterprises. Future researchers will benefit from the findings of this study because can use it as a reference for their own studies.

1.4.2 Policy Makers

The study findings will help the economic policy developers to gain insight into the operations of small and medium enterprises and offer a concrete reference for the formulation of new wide reaching policies that could enhance the financial performance of SME ventures. This will assist them to define and determine policy regulation and guidelines for small and medium enterprises in general.

1.4.3 Small scale and Medium Enterprises

The study findings will benefit small and medium enterprises on the critical success factors that need to be employed to spur their success in a highly competitive business environment. The success factors can be used by like-minded organizations to ensure success of their organizations.

1.5 Scope of the Study

The population will comprise of Small and Medium Enterprises in Nairobi City County. The respondents will be owner and managers of the SME's operating in the CBD area of Nairobi County. It is estimated that, about 21,100 SME's operate from the CBD. The data collection will be carried out in the month of December 2018.

1.6 Limitation of the Study

The study can find it difficult to generalise study findings to the broader population since primary data will be gathered from a homogenous setting. The study will only use a sample from SMEs in the CBD area of Nairobi City County. It will be ideal to incorporate data from other SMEs with similar operations across Nairobi County, but the study will concentrate only on the SMEs within the CBD area of Nairobi.

1.7 Organisation of the Proposal

The proposal is structured as follows: chapter one is the research background, research objectives, significance of the study, scope, and the limitations expected to be encountered in the course of the study. Chapter two shows literature review on effect of entrepreneurship training on financial performance of small scale and medium enterprises in Nairobi City County of Kenya and a conceptual framework. Chapter three presents the methodology to be used in the study.

Literature Review

The chapter covers the theoretical review, empirical review of the related literature on specific variables. It also presents the conceptual framework.

2.1 Theoretical Framework

The study will be guided by three theories, including financial inclusion theory, poverty alleviation theory, and financial deepening theory

2.1.1 Financial Inclusion Theory

Financial inclusion is seen as the process of availing an array of required financial services, at fair prices, right place, form and time and without discrimination to all members of the society (Aduda & Kalunda, 2012). Financial inclusion help individuals cope better with poverty especially the challenges of irregular income. Further, Aduda and Kalunda opined that the main objective of financial inclusion should be advantaging the poor majority of those who do not use formal financial services.

Proponents of financial inclusion theory opine that for micro-enterprises, financial inclusion can provide funds for setting up and expanding and for improving their income. Financial inclusion goes a long way in providing the poor individuals with opportunity to improve their standard of living and has a potential for social and economic empowerment. According to a report by Simpson & Buckland (2009), micro finance addresses the issue of financial exclusion where people do not have sufficient financial services. Financial inclusion therefore has provided a solution to the need of low income household and rural people who were left out by formal financial institution. The theory has established a positive link between financial access and economic growth and empowerments.

2.1.2 Poverty Alleviation Theory

The concept of financial literacy and micro-financing arose out of the need to provide to the low income earners and the rural people who were left out by formal financial institutions (Wahid, 1994). The theory is anchored on the idea of Grameen Bank concept in Bangladesh. Grameen Banking is the mechanism under which credit can be provided to the poorest of the poor on group liability basis instead of any collateral. Grameen Banking mostly applied in the rural areas.

The pressing need for rural economy is to create jobs for the large unemployed, underemployed labour force, to enhance productivity to the entrepreneur and growth and development for the non -youth group activities. Creation of employment requires investments in small working capital which as a result will help generate more returns and in return living standards of people is improved. Thus obtaining credit from microfinance can go a long way in helping the poor accumulate their own capital and hence improve their living standards investment through the income generated.

2.1.3 Financial Deepening Theory

Financial deepening is the increased provision of financial services and access to basic financial services such as credit, savings and insurance. FD theory was proposed by Edward S. Shaw in 1973. The theory holds that FD is a necessary pre-condition for economic growth. It is based on the premises that it enhances credit access which offers the necessary financing to firms in the economy and hence economic growth is realized (Shaw, 1973). FD enables financial intermediaries perform their functions efficiently of mobilizing, pooling and channelling domestic savings into more productive capital thereby contributing to economic growth of a country.

FD plays a vital role in increasing ability of individuals and households to access basic services such as education, health and thus having a more direct impact on poverty reduction. For a financial sector to be said to have deepened the following should be evident; increase in the range of financial services, regulations and stability of the financial sector is improved, the extent to which the capital is allocated to private sector household is increased and the amount of cash intermediated is increased (Shaw, 1973). FD brings about financial inclusion, which offers incremental and complementary solutions to deal with poverty. FD accelerates economic development since it increases the size of the financial system and its role in financing with a wider choice of services geared towards economic development. This theory has established a link between increased access to financial services and economic growth and empowerment.

2.2 Empirical Review

The following sections provide a detailed review of people's knowledge of and understanding of savings, borrowings, investments, financial analysis, and innovation. The three items for discussion form a set of independent variables that will guide this study. They are related to the themes of this study.

2.2.1 Understanding of Savings and Borrowing

Previous studies on financial literacy in Kenya consistency establish that entrepreneur lack adequate education in financial fundamentals, and they have poor knowledge and understanding ((Kisaka and Mwewa (2014), Munyori and Ngugi (2014), Mwongera (2014), Akwalu (2014), and Masese and Munene (2013)). Research study by Agarwalla, Barua, Jacob, and Varma (2015) also reveals that financial literacy for investors in India are below the required level. The finding is supported by the fact that the working entrepreneurs in India have inferior financial knowledge and understanding. Lusardi, Mitchell, and Curto (2009) recorded that financial literacy among the SMEs is wanting as many young people lack both personal and business financial skills and knowledge. According to Huston (2010), there is ardent need to step-up financial literacy in developing countries because of low rate of entrepreneur' personal and business financial knowledge. Another study conducted by Jappelli and Padula (2013), entrepreneur possesses low confidence level when it comes to skills of money management, savings, and investments and therefore the need to increase financial education.

World Bank (2012) surveyed 1,670 households countrywide on financial knowledge and ascertained an average correct score of 38 percent. The result reveals that households who are decision makers in financial matters lack a thorough grasp of financial concepts. Rogito (2010) found that, in general, entrepreneur of Marani District of Kenya had poorly healthy attitudes towards basic skills in money management as well as low knowledge in financial planning matters. The study established that most of the respondents neither manage nor plan their finances in a disciplined and structured manner.

Agarwalla, Barua, Jacob, and Varma (2015) conducted a study on financial literacy among the working entrepreneur in India. The purpose of the study was to establish the extent of understanding of financial education among the SMEs and how financial knowledge influence the way they manage their personal finances. The study involved 120 respondents selected through a random sample. The study found that majority of the Indian working young people understands what savings is and many of them save. They monitor their spending pattern and are responsible in the way the use credit. As reported by Al-Tamimi (2009), most young people in United Arab Emirates (UAE) lack adequate knowledge to balance a chequebook and do not understand fundamental principles of earning income, making spending, making savings and investments. It is quite amazing that 75% of this category of entrepreneur fall between the ages of 18 to 25 years old (Baloyi, 2010). It could be therefore concluded from the findings that entrepreneur lack basic financial skills when it comes to borrowings and savings. Behrman, J., Mitchell, Soo, and Bravo (2010) found that entrepreneur have a very low understanding of borrowings and savings.

Kisaka and Mwewa (2014) studied how access to credit, microsaving and training influence growth of small and medium Enterprises in Kiambu County in Kenya. In this study, they examined how small and medium-sized business holders make savings decions, the way they collect information for making such decisions, and whether

they have the right financial literacy skills to make informed decisons. The research concluded that only one-half of the participants could could calculate simple questions on interest compounding correctly. It was worrying that only 18% of the respondents could correctly compute questions on compound interest. Out of the businessholders who got the interest equation wrong, 43% did a simple interest calculation, and thus ignoring the interest that accrues on both principal amount and interest. Munyori and Ngugi (2014) confirm that the findings are worrying bearing in mind that majority of the respondents engaged in the sample survey are people with atleast O-level (form-four) qualification and already have gone through some basic calculations of interests and compounding interest in Mathematics class, which is a compulsory subject in Kenya, in the course of their studies. Mwongera (2014) notes that financial literacy impedes young women's ability to access credit, and thereby impacting negatively on their ability to save and borrow.

2.2.2 Understanding of Investment

Almenberg and Dreber (2011) assessed gender, financial literacy, and stock market participation. The purpose of the study was to examine personal investments among 450 students and the link between gender and investment literacy, academic area of speciality and experience. The respondents were selected through a simple random sampling technique. A statistical research design was used for the study and data were collected through structured and open-ended questionnaires and analysed by using a multiple regression. The results obtained from the study revealed that most of the college students were not literate about their personal investment, especially on stock market valuation, global investment, effect of interest rate changes as well as tax planning. The study therefore concluded that college students lack adequate knowledge on the basics of personal investments.
According to Akwalu (2014) on factors affecting performance small and medium businesses owned by entrepreneur in Maara sub-county, Tharaka-nithi county (Kenya) found that investment literacy was at its low levels. In another study of a Kenyan case study on financial inclusion and financial sector stability, 58 percent of the respondents were found to be of knowledge decicit regarding investments (Aduda and Kalunda, 2012). The entrepreneur constitute the majority of persons who undertake investment decisons (Kimanjara, 2013).

2.2.3 Financial Analysis Skills

According to Meeme (2013), the role of any business manager entails the ability to speak the language of finance, forecast expenses, manage budgets, assess risk as well as anticipate financial issues. Yet several young entrepreneurs lack trainings on these crucial aspects of their roles (Rogito, 2010). Kenya Ministry of Youth Affairs and Sports (2011) reports that majority of Kenyan entrepreneur are not well conversant with basic financial analysis skills of understanding accounting and financial information.

Masese and Munene (2013) assessed factors influencing financial performance of youth owned businesses in Kisii town of Kenya. The study adopted a descriptive survey design to examine the extent of the effect of financial planning on performance of youth owned businesses. The study targeted 150 youth owned enterprises that were situated within Kisii town of Kenya. The study findings ascertained that majority of the interviewees lacked financial analysis skills of reading and interpreting financial information, analyzing financial statements using ratios, and investment appraisal, which are necessary ingredients of any enterprise undertaking. The research also

established that respondents who regard financial planning as less important are the very people who fail to practice business financial planning.

2.2.4 Innovation

Innovation can be defined as the application of new ideas to the products, processes, or other aspects of the activities of a firm that lead to increased value. The value in this context coves broad way to incorporate higher value derived for the firm and also the benefits to consumers or other firms (Nieto and Santamaria, 2010). Several studies have attempted to make an understanding on the role of innovation within the small and medium sized enterprises around the world. Madrid-guijarro (2013) established that innovation is a critical driver of competitive advantage (Madrid, Garcia and Van, 2009). A study on SME's across Spain found that, innovation played a critical role to in changing fortunes of many businesses among them including; an increase to the market share, realization of greater production efficiency, higher productivity and higher revenues (Madrid, et. al., 2009). In a report by Tan, Fischer, Mitchell and Phan (2009), they postulated that innovation contributed to economic growth and is one of the most critical ways through which small and medium sized enterprises (SMEs) can be able to be competitive and ensure business survival. Understanding of the value innovation brings to the business scene, it can assist firms to embrace diversity in market place by introducing or improving their products which eventually results to an improvement in their financial performance (Madrid-guijarro, 2013).
Literary spectrum in business environment the concept of innovation is heterogeneous and broad. According to the European Commission (COM, 2003), innovation can be viewed as the renewal and enlargement for the "range of products and services and the associated markets" and the establishment of new methods of production, supply and distribution; the introduction in changes in management, work organization, and the working conditions and skills of workforce. The fundamental role of innovation as a driver of sustainable competitive advantage has guided managers and policymakers to strongly commit to developing and implementing initiatives that encourage innovation among SMEs (Nieto and Santamaria, 2010).

2.2.4.1 Product Innovation

Burton (2011) postulated that, innovation can be categorized in two ways; product and process innovation. In a business context, product innovation explains the form in which products or services are offered. Product innovation can be defined as the transformations pursued in an organization's production line, introduction of new products in the market or use of new and better materials in the production process (Wong, 2014).
Product innovation could be tangible manufactured goods, intangible services, or a combination of the two. Some of the examples for recent tangible product innovations that have had a very significant impact on the way people live and work are personal computers, mobile phones, and microwave ovens. Intangible products that complement these types of physical equipment include the various pieces of computer software needed to control flows of information through these devices, leading to the delivery of information, the supply of communication services, or the arrival of a correctly heated dinner. Product innovation will involve the following; technical design of the products features,

research and development and eventually marketing of the new product through commercial activities (Alegre, 2006).

Comison and Lopez (2010) in their study established that product innovation was important for an organization to be able to create a competitive edge in the changing environment. Comison et al., (2010) argued that through product innovation the organization was able to introduce new products into the market and the quality of the products was also improved and therefore in the organization gains competitive advantage over the competitors in the same industry. In conformity to this argument Hult, Hurley and Knight (2014) stated that product innovation enabled the organization to protect itself against threats from the competitors. Studies have also proved that there is positive correlation between the performance of the organization and positive product innovation (Buyus, Erickson and Jacobson, 2013).

Espallardo and Ballester (2009) in a study carried out in an organization established that product innovation had a positive impact on the organization's performance in its industry. Varis and Littunen (2010) established that the more an organization was able to introduce new products into the market the more customers associated with that organization as it is assumed the organization is performing well. SMEs have a number of drawbacks when it comes to innovation process as compared to large organizations (Rhee, Park, & Lee, 2010). Nonetheless, the SMEs have the advantage of being close to the customers and therefore have the knowledge of the customers' tastes and preferences as opposed to the larger organizations (Rhee, Park, & Lee, 2010). Besides having the knowledge of the customers changing tastes and preferences the SMESs have the advantage being able to learn and adjust accordingly faster than the larger organizations.

2.2.4.2 Process Innovation

According to Nieto and Santamaria (2010), the term process innovation can mean the idea for the development process that ultimately results to the introduction of new products and services to the market. It is believed that innovation is a key element in the development of the economy in a country and the industry in which that the innovation is carried out in (Beaver, 2012).

For process innovation to be a success, the organization has to tap on the knowledge available in the organization, which can inform kind of institutional understanding gained through the learning process and finally the need of the customers in the market (Berg, Johnson, Lorenz and Lundvall, 2007).

Calantone, Cavusgil and Zhao (2009), observed that process innovation is process that is adapted by the organization in order to adapt itself to the changes in the environment. The process of innovation will therefore involve building on the capabilities of the organization in order to create new products and services (Yang and Choi, 2009). 13 Romijin and Albaladejo (2012) argued that innovation is created in social network interactions by the different people that are involved in the formulation of the process. This interaction may involve the organization suppliers, its customers, the members of the public and the corporation. It has been argued that an organization that has a closer relationship to the potential customers than the competitors will have the advantage of being more creative than the competitors hence being more innovate (Lawson and Samson, 2008). This is because the organization will have new ideas and will be the first to introduce a new and unique product in the market.

Anderson, Wahab, Amin and Chong (2009) postulated that process innovation is one of the ways through which a business corporation can gain competitive advantage. Process innovation is the way through which the organization can improve its productivity (Bakar and Ahmad, 2010). Process innovation is about changes in technology and science with the aim of coming up with a superior product or service that will compete favourable in the market (Harmaakorpi and Melkas, 2008).

Innovation implemented through adoption of information technology (IT) has been seen to increase SMEs performance substantially (Andries and Debackere, 2007). According to Nguyen, Newby and Macaulay (2015), there have been a number of research studies on the determinants of IT adoption in small businesses such as those by Bharadwaj and Soni (2007) and Irvine and Anderson (2008), all of which had a focus on searching for factors that affect the decision and intention to adopt IT. These factors include cost benefits, management innovativeness, perception, knowledge and skills, employee attitudes, IT skills and knowledge of management and employees, and IT infrastructure. The decision to adopt is also influenced by external factors such as consultants, business partners, suppliers, and customers.

Studies suggest that for many firms, the most common objectives for IT adoption are to enhance organizational survival and/or growth and to remain competitive and/or enhance innovative capacity (Bruque and Moyano 2011; Búrca, Fynes, and Marshall 2010). These can be the result of pressure from both the internal and external environment from either an emphasis on improving efficiency and business expansion or a pressure to meet certain requirements from customers and industry standards (Andries and Debackere 2007).

According to Oduori (2016), an innovation generates long-term advantage to the firm when customers feel that the enhanced performance has value for them. Service and service delivery can be, and increasingly are, a competitive weapon. Some firms in the same industry anchor their reactions to environmental changes to the behavior of other firms that are strategically similar to themselves, while others may adopt a more independent stance by emphasizing new product or market innovations (Kamalesh, Boesso, Favotto, & Menini, 2012). Technology innovation has the power to transform consumer expectations, disrupt competitive dynamics, and reshape the travel distribution chain. The most innovative firms are those that actively deploy emerging technologies to gain competitive advantage.

The study done by Oduori (2016), found out that a higher level of innovation was found among firms that strived to improve customer service and existing organizational competency (knowledge, skills and attitude). Most firms are compelled to respond and adapt to the ever-changing business environment through innovation in order to survive the competitive pressure. It was then concluded that anticipating and satisfying customer needs as well as continuously improving employee skills was critical to small and medium enterprises in Kenya. Al-mahrouq (2010), conducted a study to determine success factors of small and medium sized enterprises in Jordan. In his findings, he ranked technical procedures and level of technology as the most important factor. Five variables that were analyzed in the study were: high technology of equipments, use of planning and engineering of the production operation, research and development systems, operating methods and new technology and automation.
According to a report conducted by Oxford Economics (2013), SMEs are facing various challenges including economic uncertainty, shifting customer demands and expectations, increased labour costs and increased global competition. SMEs are responding to these challenges with several strategic initiatives. More than half cite driving innovation, cost reduction, and efficiencies as the most important of these efforts, with emerging markets and Latin American companies placing an especially high emphasis on these areas.

2.3 Research Gap and Summary of the Literature

The literature review above presents several looming gaps. First, several studies failed to incorporate the variable of availability to learn and improve financial literacy skills in their financial literacy questions and tests. The review of literature established that only Masese and Munene (2013) mentioned financial analysis skills in their financial literacy study, but failed to incorporate the variable in their test or questions, and instead concentrated on budget and budgetary process. This study will therefore incorporate financial analysis skills because it is a key ingredient of business to interpret financial statements and analyze financial statements using key ratios. Since national and county governments of Kenya are currently putting up interventions towards improving financial literacy, it is

important to investigate entrepreneurs' knowledge in financial literacy skills to come up with interventions to improve their understanding and to stimulate their interest in using financial literacy seminars.

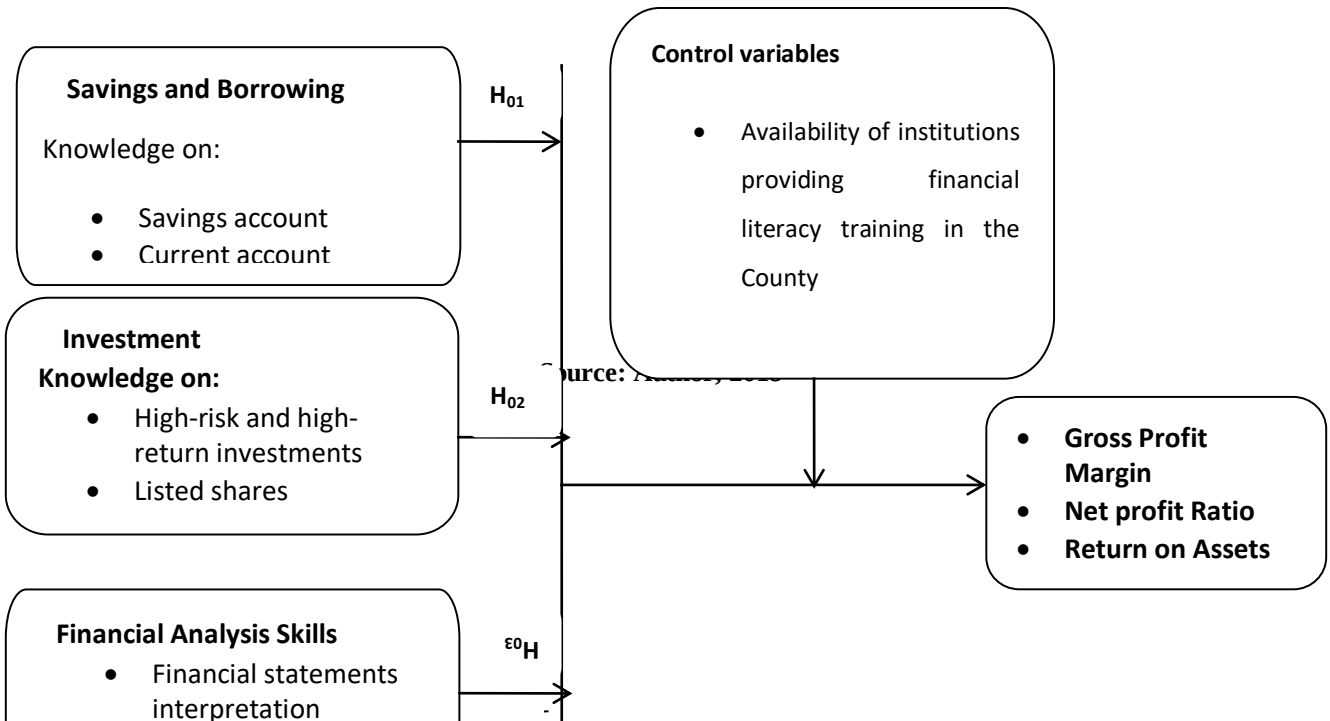
Most studies concentrated on the effect of financial literacy on personal finance with little reference to business finance. The current study will provide robust evidence by concentrating on business finance specifically incorporating questions on practices. Third, some studies assessed factors affecting the acquisition of financial knowledge, but none of them sought from their interviewees where they could access financial knowledge.

Finally, to the best of the researcher's knowledge, studies done on financial literacy in Kenya are scarce and sometimes limited in coverage. The few studies done in Kenya include Kisaka and Mwewa (2014), Munyori and Ngugi (2014), Mwongera (2014), Akwalu (2014), and Masese and Munene (2013). The last study by Masese and Munene (2013) was only limited to youth owned enterprises within Kisii town of Kenya. However, this study will extensively cover 70 SMEs in CBD area of Narobi City County of Kenya and the sample covers various genders and educational levels. The study also assesses comprehensively entrepreneurs' knowledge from four different dimensions such as savings and borrowings, investments, financial analysis skills, and innovation.

2.4 Conceptual Framework

The conceptual framework of this study examines the relationship between entrepreneurship training and financial performance. Entrepreneurship training comprises four independent variables such as saving and borrowing, investments, financial analysis skills, innovation, and availability of institutions providing financial literacy courses as the control variable. The control variable is the availability of institutions providing financial literacy training. The purpose of the study, therefore, is to examine effects of entrepreneurship training on financial performance of small and medium scale enterprises in Nairobi City County.

Figure 2.1: Conceptual Framework



CHAPTER THREE

RESEARCH METHODOLOGY

3.0 Introduction

This chapter covers the research design, target population, sample size and sampling procedures, research instruments, data collection procedures, data analysis techniques and ethical considerations.

3.1 Research Design

The study will use a descriptive survey research design. The rationale for the choice of a descriptive research design is supported by the fact that it enables the researcher to gather information that is detailed and factual as well as permeates analysis and referring (Creswell, 2014). The design is deemed suitable for this study since it describes a phenomenon in its current form and the present scenario. It also enables the researcher to collect information, make a summary, and present relationship. The design will enable the researcher to capture opinion of small scale and medium scale traders in CBD area of Nairobi regarding effects of entrepreneurship training on financial performance of their businesses.

3.2 Study Population

The study will targets SMEs situated at the CBD area of Nairobi City County. The delimitation that will be employed is the consideration of Nairobi City County (NCC) trading licenses and only the SME's that have this certification are captured in this study. The researcher targets owners and managers of SME's in the CBD across all sectors as listed in the Nairobi city county licensing department in the year 2018. Nairobi county has about 98,600 business that have NCC trading licenses (Nairobi County, 2018).There are about 8 clusters of different sub-sectors in Nairobi CBD, which are clustered by NCC using business codes across different sectors. These main sectors targeted in this study include; Retail sector, Transport, Hospitality, catering, entertainment, pharmaceuticals & health services, technology and Real Estate. Nairobi business licensing department estimate that, from the above main sectors, there are about 21,100 in CBD area.

3.3 Sampling Frame and Sampling Techniques

Sampling frame is the actual list of elements through which the sample that forms the units of observation is drawn (Creswell, 2014). This sample frame in this study will comprise of managers and owners of the 21,100 SME

businesses operating from the CBD in Nairobi city. The SME's through which the sample is drawn from, were required to at least possess the Nairobi City County business trading license.

Sampling technique is the process through which the entities in a sample are identified and selected (OECD, 2004). This study will rely on stratified sampling through which 8 clusters of categories were used to classify the businesses. According to Kothari (2004), stratified sampling enables the participation of all components that make up a study population. From these clusters, it will be possible to get a representative sample from each individual cluster and enabled to cover all the business that operate within the city of Nairobi.

A sample size is the sub-set of the large population (Cooper and Schindler, 2006). All SME's operating in Nairobi City central business district that are licensed by the Nairobi city county government were included in this study. The size of the sample was determined using the Fisher's et al. (2007) formula

$n=Z^2\ pq/d^2$

Where n=the desired sample size

Z=standard normal deviation at required confidence level 95% or 1.96

P= Business owners and managers, 0.214 of the entire population of SME's.

Calculation = SMEs in CBD/SME′ in Nairobi County ×100%

= 21,100/98,600 ×100%

= 21.4% (0.214)

q=1-p (the proportion without characteristics)

d=level of statistical significance (degree of freedom=0.05)

$n = 1.96^2(0.214)(0.214)/(0.05)^2$

n (desired sample size) =70 respondents

Table 3.1: Category of SME, Target Population and Sample Size

Category of SME	**Number in CBD**	**Percentage (%)**	**Sample Size**
Informal-Juakali	254	1%	4
General trade, wholesale, retail stores	11,353	54%	8

Agriculture, Forestry and Natural Resources	1,025	6%	2
Accommodation, catering (hospitality)	1,750	8%	12
Professional and technical services	3,242	15%	10
Private education, health, and entertainment	934	4%	7
Transport, storage, and communications	1,200	5%	12
Industrial plants, factories, and workshops	1,342	7%	15
TOTAL	**21,100**	**100%**	**70**

3.4 Methods and Instruments of Data Collection

The study will use questionnaires and interview schedules to collect data. The selection of instrument depends on the objectives of the study as some studies may require use of only gather data, the researcher has to ensure that the instrument selected is valid and reliable as the validity and reliability of any research project depends to a large extent on the appropriateness of the instruments. In order to efficiently collect primary data, a structured questionnaire and interview schedule will be developed to assist the researcher in establishing the effects of entrepreneurship training on financial performance of small scale and medium enterprises in Nairobi City County.

3.4.1 Questionnaires

In this study, a detailed questionnaire will include both structured and unstructured questions, which will give the respondents freedom to freely express their feelings and experiences leadership safe practices with questions designed to probe the respondents to provide in-depth information to their influence on quality and patient safety performance. A questionnaire is a means of eliciting the feelings, beliefs, experiences, perceptions or attitudes of some sample of individuals (Creswell & Clark, 2011). As a data-collecting instrument, a questionnaire could be structured or unstructured.

3.4.2 Interview Schedules

The researcher will prepare the interview guide that will gather detailed information from management and owners of SMEs in the CBD area of Nairobi City County. This will involve subjecting every sampled participant to the set of predetermined questions. Sufficient opportunities will be given to the participants to ask questions related to the procedures of the research study at any time during the research process. The participants' names and any identifying characteristics will be coded to ensure confidentiality during the data collection process.

3.5 Validity and Reliability

This section covers the validity and reliability of instruments.

3.5.1 Validity of Instruments

The researcher will establish content validity by subjecting the questionnaires and interviews to a pilot study. Validity plays a significant role in a study in that it is a powerful source used to determine the accuracy of the study's findings (Gay, Mills & Airasian, 2012). The questionnaires and interview schedules will then be checked and corrected by the supervisors to ensure that the questions are valid to the topic. Questions that will not be well understood during the pilot study will be revised and amended accordingly to give research findings credibility.

3.5.2 Reliability of Instruments

The study will adopt test-retest method to determine reliability of instruments. Questions will be asked twice to the same respondents at different time to ascertain whether their responses are the same and test-retest reliability co-efficient will be calculated. Pearson correlation co-efficient will be used for measuring reliability for the two tests. On this scale, a correlation of .9 (90%) would indicate a very high correlation (good reliability) and a value of 10% a very low one (poor reliability) (Creswell, 2014).

The reliability of the instruments will be conducted during the pre-testing of the instruments. Reliability of the instrument will be ascertained by re-administering the questionnaire to the same sampled respondents in a two-week interval to determine it reproducibility. Assessment of the questionnaire items will be made and those found with errors or inadequate will be modified accordingly.

3.6 Data Analysis Procedures

The data analysis will be done through qualitative and quantitative analysis. The analysis of qualitative research aims at uncovering and or understanding the bigger picture by using the data to describe the phenomenon. Both

qualitative and quantitative analyses involve labelling and coding all of the data so that similarities and differences can be recognized. Responses can be entered into a computer for it to be coded, counted and analyzed.

3.7 Ethical Considerations of the Study

The upholding of ethical considerations will be assured by using coding and pseudonyms for the name of the health facility where the participant will be working during the time of study and the participants being interviewed. The interview data, document data and participant input will be maintained in a locked filing cabinet in a locked office and the electronic information secured on a laptop that is used by the researcher only.

The desired outcome of this study is to establish effects of entrepreneurship training on financial performance of SMEs in Nairobi City County. Approval to conduct the research will therefore be obtained from the appropriate administrative personnel and prior to conducting the research. It is also vital for the researcher to gain permission from the National Council of Science and Technology through an introduction letter from Kenyatta University graduate school of business.

ABSTRACT

The study examined the role of counselling services on the performance of Administration Police Service in Nairobi City County, Kenya. The propositions of theory of efficiency were used to provide the conceptual underpinnings of the study variables. The study adopted descriptive research design as a basis for the research strategy. Semi-structured questionnaires with closed-ended and open ended questions were utilized to collect data because they are convenient and time saving. A sample of 100 participants was selected from the target population of 2400 administration police officers working in Nairobi County through the use of stratified sampling. The results of bivariate correlation analysis indicated a statistical significant moderate positive linear correlation between counselling services and performance at ninety five percent level of confidence. Further statistical analysis seeking to reveal the actual parameters in the cause-effect relationship involved performance of simple linear regression analysis which showed that counselling services had a positive contribution to performance with an explanatory power of approximately forty two percent. This kind of empirical insight is crucial and useful to management of administration police service because it can be used to inform policy. It also contributes to the falsification of the postulates of the theory of efficiency. In essence, the findings provide a springboard for future researcher who may wish to unearth other factors that may be responsible for performance within organizations.

Key Words; ***Welfare Strategies, Counselling Services, Organizational Performance, Influence***

1.0 Introduction

Organizational performance is central to the survival of any firm. It ranges from the diverse areas like marketing, human resources, management of operations, international business as well as information systems (Singh, Darwish, & Potocnik, 2016). This means that activities within and without the organization determine the performance of the organization. There are different models of measuring performance which include the goal model, the process model the systems model, the strategic constituencies model and competing values framework (Martz, 2013).

Organizational performance can be measured through different ways. According to Martz (2013), it can be measured by evaluation of the complete or partial realization of an organization's goals. The goals are commonly accepted as part of the organization's culture, design, and structure, and the aim of the organization is it effected in the form of a particular goal or set of goals. One goal of organizational performance is customer satisfaction. In this regard, therefore, it becomes important to know what is expected by costumers in terms of quality, costs as well as distribution, and most importantly what is needed in future from the organization (Ivanov & Avasilcai, 2014). In other words, the present and future expectations of customers form the public performance of that very organization.

It can also be measured by considering the legality, morality and fidelity of the organization's activities (Martz, 2013). This means that any outcome contradicting these ideals will translate to poor or unfavourable performance. Performance, therefore, under this framework is said to be measured in relation to an organization's values or ideals. Closely related to these organizational values is goal optimization in which performance is measured by the maximizing the organization's achievement in relation to the available structures (Dess & Robinson, 2014). These values may be regarded as the internal processes that propel the external outcomes. Ivanov and Avasilcai (2014) argue that an organization that understands how internal processes work helps it achieve its objectives and at the same time know how to increase the value of its products and services to the customers. Furthermore, when internal processes are improved, the all-round performance of an organization is improved in its entirety.

Conn and Butterfield (2013) distinguish workplace stressors as operational, that is, relating to traumatic incidents, and organizational like personal shortages along with shift work. Consequently, increased stress may result to development of mental health issues like depression, anxiety and posttraumatic stress. On that note, Tsai, Nolasco and Vaughn (2017) in a study on United States Police found that sex, race, education as well as tenure do not directly influence the entire job stress of police employees. However, these same factors affect family discussions with fellow workers, counselling help and negative work environment. Continentally, Ekpang (2015) found that Nigerian employees had a notable improvement of performance of workers after receiving counselling help. Locally, studies have established that the police in some parts of the country like Nakuru perform fairly despite the high risks in their job and lack of proper support system (Jonyo, 2015) while others indicate that police employees perform poorly (Oweke, Muola & Ngumi, 2014). The studies, however, do not focus on counselling help as the current help but different coping mechanisms.

The Administration Police Service aims at providing services to all people with equity and fairness. However, several damning reports have been raised regarding the performance of police officers in Kenya. In a report released by WISPI in 2017, the police service in Kenya has been ranked third last worldwide in the provision of security services to the citizens as Kiage (2017) reports. Another report released by the IPOA (2016) following the demonstrations against the IEBC showed high levels of police brutality where 88 people sustained injuries and others detained for more than the recommended 24 hours without trial. In addition, the KEPSA report showed that each business within the Central Business District (CBD) lost Kshs.48,304 per day every moment public protests arose. Indeed, these negative reports of performance of the police in Kenya point to underlying factors, which may need to be addressed.

Different studies have been conducted on the influence of welfare practices on the performance of employees. A few studies focusing on the influence of counselling services and performance indicate a positive relationship between counselling and performance (Adegoke, 2014; Jonyo, 2015; Menard & Michael, 2014). However, the studies do not focus directly on counselling services but work stress, occupational stress and stress coping, hence the current study. The current study therefore aimed at establishing the effect of counselling services on the performance of Administration Police Service in Nairobi City County, Kenya.

2.0 Literature Review

The efficiency theory as propounded by Archer (2010) focuses on measures of effectiveness that gives minimal waste of time, effort as well as skill. Archer likened efficiency with other activities such as recycling of waste, sound utilization of space, collecting data which are impersonal. Efficiency in general describes the extent to which resources such as time, space, energy, etc. are well used for the intended task or purpose. In this case, an individual is viewed as a tool whose efficiency can be maximized within the society as a whole. According to Manju and Mishra (2007), in this theory, aspects of welfare strategy such as counselling are considered as a way of securing, preserving and developing the efficiency as well as the productivity of labour. Consequently, concerns and emphasis in the workplace are intended to protect the vulnerabilities of the workers by an employer whereby, various aspects of oppression are suppressed as argued by Rodgers (2016).

If an employer cares for their workforce, for instance, the likely end would be a resultant improvement of production of an organization. The theory helps in understanding the characteristics of labour force as reflected on the modern support for labour and it works well if the employer and employees collaborate. This is because they have a common goal of achieving higher production as long as the welfare is ameliorated. This can only work well if and only if a proper collaboration between the union and the management as long as there is mutual concern for growing the organization (Manju & Mishra, 2007).

The theory, according to Rodgers (2016), has been criticized of legal precariousness because of changes in global problems of precarious workers. This is because the theory is founded on the traditional standard employment laws of long term relationships between employees and organizations. The breakdown of the standard employment relationships to precarious workers reduces their chances of qualifying for the employment law making them to fall outside the precincts of legislation. Despite these problems associated with vulnerability, it has been noted that critics of the theory need to understand the notion of vulnerability and especially how they affect the regulation of precarious work.

This theory addresses the independent variable of welfare practices whose betterment results in employee effectiveness and consequent higher production. Higher production is thus meritorious to both the management as well as the labour. The functional aspect of welfare, therefore, is having efficiency as its goal because this improves productivity. This theory therefore advocates that parties (employer and employees) develop a like-minded relationship that aims at higher production through better welfare. The consequent for this identical relationship is to encourage the participation of employees in the welfare programs (Manju & Mishra, 2007). This theory was important because it likened employees to tools which should be maintained by the employer through proper welfare practices.

2.1 Empirical Literature Review

Menard and Arter (2014) conducted an online study among police officers drawn from different countries across the world who had been identified according to different organizations. The study utilized a survey design where a total of 1453 officers drawn from 13 countries from different continents. In the findings, there was a difference in coping mechanisms for men compared to women as indicated in the AUDIT score. Negative coping with the symptoms of Posttraumatic Stress Disorder were common for both sexes and more on women. As a recommendation from the

study findings, police departments needed to promote adaptive coping strategies to counter the behaviour. This study indicates the importance of workplace counselling and how it may improve the welfare of police officers to cope better with stress emanating from critical incidents. However, its focus is on genders and not how counselling influences performance, and at the same time it was conducted in a different context.

Police officers face the consequences of untreated stress because sometimes they may fail utilize the available interventions (Carlan & Norad, 2008). Tucker (2014) conducted a study in Pennsylvania among 673 police officers to determine the willingness of police officer in utilizing stress intervention services provided by their organization. The study utilized a descriptive survey design and random sampling method in collecting data. The findings revealed that stigma pushed police officers away from seeking counselling services especially regarding confidentiality. On the other hand, perceived organizational support was positively correlated with the willingness of police officers in using services provided by the organization. While this study shows the importance of psychological help, it does not show how the services influence performance but the willingness to utilize the services.

Adegoke (2014) conducted a study in Nigeria among 250 police employees drawn from five local government areas of Ibadan metropolis using a descriptive survey design. The data was sampled through systematic random sampling and the data analysed using one way analysis of variance. The results indicated a significant relationship between the effects of work-stress, frustration and depression on the psychological wellbeing of the police employees thus recommending the initiation of programs for helping the employees in dealing with psychological issues. The study is useful because it shows how unaddressed psychological issues of police officers can weigh down on their performance. However, it does not focus directly on how counselling help assists police officers as intended in the current study.

Adekunle (2017) conducted a study on police officers in Ibadan to determine how emotional intelligence, dispositional optimism and emotional exhaustion affect the well-being of police officers. The study utilized a descriptive survey and 276 police officers selected using systematic random sampling. The findings revealed that emotional intelligence coupled with dispositional and emotional exhaustion significantly influenced the prediction of police wellbeing. The study recommended interventions to deal with stressors such as obsolete equipment, salary delays, delayed promotions, understaffing, under-training, infighting which lead to emotional exhaustion. While the study shows the predictors of stress as well as the causes of emotional exhaustion as Adegoke (2014), it does not directly show how the performance is affected hence the need for the current study.

Jonyo (2015) conducted a study to determine the effect of occupational stress on work performance of police officers in Nakuru, Kenya. The study utilized a descriptive survey design and stratified sampling used to recruit 269 police officers to the study. The data was collected using questionnaires. The findings indicate that despite police officers being exposed to high levels of occupational stress, most of them were able to perform fairly as they adopted to the stress by adopting proper coping stress management techniques like seeking professional counselling, peer counselling, good sleeping habits and the like. The study however focused on occupational stress and coping mechanisms, but not counselling help in particular as intended in this study.

Ongoro and Oloko (2015) carried out a study on the effect of stress on job performance among 309 police officers. The study utilized both descriptive and correlation study designs in which random and simple random sampling techniques were used. Questionnaires and interview schedules were utilized to collect data from the respondents. The findings confirmed that depression, anxiety and anger are prevalent among police officers where anger was the highest thus recommending the introduction of stress management programs. These include; stress counselling and debriefing, anger management skills, inclusive decision making and briefing of police officers before pre-traumatic scenes. The study focused on effect of stress on performance and not how counselling help or stress management impacts on the performance of police officers.

3.0 Research Methodology

The study used a descriptive survey design in examining how counselling services can influence the performance of the Administration Police Service. According to Orodho (2009), a descriptive survey identifies the standards against which the existing conditions can be compared. The design was chosen as relevant because it can gather data at a given point in time and at the same time examine any given situation as it is (Mugenda & Mugenda, 2003). As stated by Creswell (2003), a descriptive research design is used when data are collected to describe settings, organizations, persons or phenomena. Descriptive survey design was preferred since the study was carried out in a limited geographical scope, and thus was logistically simpler and easier to conduct considering its limitations.

The targeted population comprised of the staff working in the Administration Police as shown in Table 1.

Table 1 Target Population

Employee category	**Frequency**
Commissioner of police	4
Senior superintendent of police	4
Superintendent of police	6
Assistant superintendent of police	8
Chief Inspector	14
Inspector	60
Senior Sergeant	40
Sergeant	60
Corporal	160
Constables	2044
Total	**2400**

Source: Administration Police Service (2018)

The researcher used proportionate stratified sampling technique in relation to the different ranks of the Administration Police Service in determining the sample size that will be drawn from each category. According to O'leary (2004), stratified random sampling includes the division of the target population into different homogenous strata from which a simple random sample is selected in each layer. Random sampling ensures that the law of statistical regularity necessary for representativeness in a population is put into consideration as offered by Kothari (2004). Stratification was preferred because it significantly ensured that the different strata in the population were sufficiently represented and thus according the researcher with a representative sample (Mugenda & Mugenda, 2003).

Since Nairobi County has 2400 administration police officers working in different posts across the County, a sample of 100 officers was selected at random. However, top officers in ranking were entirely selected due to their small number. A study sample was calculated using the Yamane (1976) formula and 100 participants selected as shown in Table 3.2. The formula for attaining the study sample is as shown in the formula below.

n=N/((1-N)e2)

N is the population

n = sample

P = percentage sample

e = margin of error

2400/(1-2400)(0.1)2

2400/23.99 =100.04168

Total sample =100 participants.

Table 2: Distribution of Sample Size

Category	Population (N)	% Sample (P)	Sample Size (n)
Commissioner of police	4	0.07	4
Senior superintendent of police	4	0.07	4
Superintendent of police	6	0.25	6
Assistant superintendent of police	8	0.33	8
Chief Inspector	14	0.58	1
Inspector	60	2.5	5
Senior Sergeant	40	0.2	5
Sergeant	60	2.5	5
Corporal	160	6.7	20
Constables	2044	85	42
Total	**2400**		**100**

Source: Author (2018)

The study made use of primary data that was collected using a semi-structured questionnaire that comprised of closed and open ended questions. The questionnaire was divided into two sections including a section for general information and specific information. The first section for specific information was divided on the basis of the variables of the study. In this case, the sub-section collected information on the influence of counselling services on the performance of Administration Police Service and comprised of 2 items Likert scale item as well as a short explanation on the same. The second subsection had four items on suggestions for improvement of performance of Administration Police Service.

Validity can be termed as the credibility of a research instrument in providing genuine outcomes (Mugenda & Mugenda, 2003). The study used external, content and construct validity. The external validity which is also known as the face validity was catered for by creating a tool that is in line with the topic of the study. Furthermore, the researcher made use of expert opinion as well as involvement of a pilot group in order to obtain suggestions for modification of the instrument as observed by Rousson, Gasser and Seifer (2002). Content validity is concerned with sample population representativeness as noted by Gillham (2008). It thus draws from inferring from test of scores from a large domain of similar items as those of the current test. To ensure content validity, the researcher drew from an expansive literature review of related items.

The study utilized factor analysis to establish construct validity for the variables utilized in this study as proposed by Kerlinger and Lee (2000). The factor analysis was conducted by referring to the prior theoretical expectations. To test validity, confirmatory factor analysis was conducted. It involved describing variability among observed variables as well as correlated variables in terms of lower number of latent variables known as factors. Hare and Neumann (2008) observe that factor analysis helps in grouping variables with the same characteristics together. By doing so, it assisted in reducing large numbers of variables for the purposes of modelling and selecting subset variables from large sets based on what original variables on the highest correlations with that factor. Furthermore,

the squared factor loading indicated the percentage of variance in the original variables as explained by a single factor as Field (2009) argues.

Reliability has been defined as the ability of an instrument to provide consistent results (Treiman, 2009). The most important index of internal consistency is the index alpha and it is considered as the mean of correlations of variables, and does not rely on their arrangement as observed by Anastasiadou (2006). Instrument reliability is ensured by using many items of measure, testing various samples of respondents and utilizing uniform procedures of testing. Accordingly, a pilot study was carried out involving 20 respondents who will be selected from the target population to determine the reliability of the data collection instrument. The index alpha was calculated for the different items that form the research variable and so the overall reliability of the questionnaire was determined. For this research, an index alpha of 0.762 was realized and was rated as good. Items that did not reach a threshold of 0.7 on Cronbach's alpha were discarded.

The data was collected by distributing the instrument to the respondents and giving time to complete. Before distributing the item, the researcher explained to the respondents the purpose of the study, the procedures involved and the benefits. At the same time, he explained the harms involved but encouraged them to participate in the study. Having given them information on the study, the researcher requested for their consent by signing the informed consent form. Those who consented were issued with the questionnaire and given a period of one week to complete the instrument. The researcher made themselves available for any clarifications concerning the items of the study in order to collect effective data. The duly filled questionnaire was collected ready for data analysis.

The research collected both quantitative and qualitative data and so it was subject to quantitative and qualitative analysis. The data was first sorted and edited to do away with errors and inconsistencies. The purpose of editing was to ensure the objectivity of coding which facilitates data entry and processing as well as interpretations of the results. The coded data was entered according to the codes and finally checked for accuracy, erroneous data, completeness as well as consistency. Quantitative data was analysed using descriptive statistics like mode, mean; standard deviation and so on, as well as inferential statistics which involved linear regression. The data was presented using frequency tables, percentages, graphs, charts and pie charts. The descriptive statistics were applied because they summarize and make data interpretation to be easier. The multiple regression model was be as shown below.

$$Y=\beta 0 +\beta 1X1 + \varepsilon \quad \text{.....3.1}$$

Where:

Y= Performance

X1= Counselling Services

β1= Beta coefficients

ε = Error term

The computations of simple linear regressions were done using the statistical package for social sciences (SPSS) version 24.0. Analysis of variance was utilized in testing whether the entire model was statistically significant by showing whether or not R2 value may came about by chance only. The F-ratio produced in the ANOVA table measured the probability of chance departing from a straight line. If the p value of the F-ratio was lesser than .05 the model was deemed statistically significant at a confidence level of 95 percent. For the specific variables, the p values of their coefficients produced in the regression analysis should be less than .05 in order for the relationship to be declared significant at 95 percent confidence level. The qualitative data on the other hand, was coded into themes and interpretive analysis applied to determine the inferred meaning and presented in narrative form.

The participants were required to give their consent during the study and those who accepted be enrolled. Those who did not consent were not be compelled to do so and any other participant who wished to drop out of the research was allowed to do so at will. The study participants were assured of confidentiality before during and after the study so as to promote their autonomy. The questionnaire did not also bear the name of the respondents so as to protect their identity. Finally, data collected was stored under lock and key to protect access by unauthorized parties. After the study, it was destroyed so as to protect the participants from any unforeseen harm. The researcher obtained a permit from the National Commission for Science Technology and Innovation (NACOSTI). The researcher also obtained permission from the relevant authorities in the Administration Police Service in order to carry out their research.

4.0 Research Findings and Discussion

The data for this study was gathered using a questionnaire which had been administered to 100 respondents out of which 73 were returned representing a response and non-response rates of 73% and 27% respectively. According to Mugenda and Mugenda (2003) a response rate of 50.5% is considered adequate, 60% good while 70% and above is deemed excellent for analysis.

4.1 Descriptive Statistics

The researcher utilized sample mean together with standard deviation in order arrive at the summary of the measures in describing the sample characteristics. Descriptive statistics were analysed on the data collected from the respondents regarding the two variables that were the focus of the investigation. In addition, the results of the analysis became the basis for making statistical analysis as well as drawing of inferences.

The computations for descriptive statistics were conducted to determine the behaviour along with the spread of responses in respect to six statements that were utilized in measuring counselling services. The findings for descriptive statistics for counselling services are as shown in table 4.1.

Table 3: Descriptive Statistics for Counselling Services

	n	Minimum	Maximum	Mean	Std. Deviation
Coping with Stress	73	3	5	4.22	.449
Reduce drug abuse	73	3	5	4.07	.561
Help in dealing with family related stress	73	3	5	4.23	.613
Help in Managing debts	73	2	5	4.14	.673
Help in Relating with others	73	3	5	4.00	.645
Help in dealing with emotions	73	3	5	4.37	.589
Aggregate Score				4.17	.588

Source: Field Data (2019)

Table 3 above indicates the descriptive statistics for counselling that majority of respondents had sample means ranging between 4.00 and 4.3 and standard deviations ranging between .449 and .673. The aggregate score for items was 4.17 and standard deviation .588 meaning most respondents agreed on the items on counselling services. This finding confirmed Adekunle (2017) who opined that emotional intelligence, dispositional and emotional exhaustion predict the wellbeing of police officers. This indicates that majority of the police officers saw counselling as a service that may help in developing skills for coping with stress, handling relations and managing possible stressors.
The researcher sought the opinion of the respondents on the importance of counselling services. There was a noted consensus that counselling services are critical to performance. The most common reasons for their agreement were that counselling helped them strike a work-life balance, dealing with stress, decision-making, handling emotions and tackling change. The responses confirmed findings by Adegoke (2014).

Furthermore, the researcher carried out sample measures with the use of responses on the statements on performance of Administration Police Officers. The analysis produced sample means and standard deviations for individual responses as shown in table 4.2.

Table 4 Descriptive Statistics for Performance

	n	Minimum	Maximum	Mean	Std. Deviation
Work attendance	73	3	5	3.95	.598
Work efficiency	73	3	5	4.37	.540
Turnaround times	73	1	3	1.73	.584
Stress coping strategies	73	3	5	4.16	.527
Work related accidents	73	1	5	2.42	1.166

Source: Field Data (2019)

Table 4.7 above shows the descriptive statistics for performance. The sample scores on the items range between 1.68 and 4.36. The scores on performance of the respondents indicate that majority indicated that work attendance remained constant (mean 3.95, sd = .598); work efficiency increased (mean 4.37, sd = .540); turnaround times highly decreased (mean 1.73, sd = .584); stress coping strategies increased (mean 4.16, sd = .527) and work related accidents decreased (mean 2.42, sd = 1.122). Performance is indicated by work attendance (Nderi & Kirai, 2017), work efficiency and concentration (Mohamed et al., 2016), work-related accidents due to proper working environment (Mwirigi *et al*., 2017); turnaround times as result of efficiency (Kumar, 2017) and relevant stress coping strategies (Jonyo, 2014). Since most of the employees were in agreement with these findings, it shows that the performance may have influenced by the selected welfare strategies.

4.2 Inferential Statistics

The researcher carried out inferential statistics to determine the correlations of the key variables as well as influence. To do so, bivariate correlational analysis and regression analysis were carried out as shown in table 4 and 5.

Table 4 Bivariate Correlational Analysis

Counselling Services		**Performance**
Counselling Services	Pearson Correlation	.523*
	Sig. (2-tailed)	.041
	N	73

Table 4 indicates that a significant positive correlation exists between counselling services and performance (r=.523*, p=.041). This implies that effective counselling services are likely to improve the performance of employees. In this case, the *r*- value of .523 indicated a moderately strong positive correlation between counselling and performance. This result is in agreement with Adegoke (2014) who found that stress impacted negatively on performance of employees. Counselling services can be a suitable intervention for performance of Administration Police officers.

Table 5: Regression Analysis

Model Summary				
Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	.423[a]	.392	.354	1.788

ANOVA[a]

Model		Sum of Squares	df	Mean Square	F	Sig.
1	Regression	.118	1	.118	.037	.048[b]
	Residual	226.895	71	3.196		
	Total	227.014	72			

Coefficients[a]

Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.
		B	Std. Error	Beta		
1	(Constant)	7.193	2.933		5.863	.000
	CSP	-.022	.117	.423	.192	.048

From the regression analysis, an R Square value of .423 was realized meaning that 42.3% of changes in performance may be explained by counselling services. Furthermore an F-test with 71 and 72 degrees of freedom was realized suggesting the test was significant and linear relationship existed between the variables measured in the model. The significance level (p=0.048) is less that 0.05 significance level thus the model was suitable enough to predict the influence of counselling services on performance of Administration Police Officers. From the regression model, the following regression model was derived.

Performance = 7.193 +0.423 Counselling services.

The regression gave a statistical model under which under which the influence of counselling services was established. In the current study, by holding the predictor at zero, it will translate into an increase of 7.193 on performance. A change in one unit of counselling services will result in .423 increments in performance.

This study aimed at establishing the effect of counselling services on performance of Administration Police Officers. Counselling services were operationalized in terms of stress management, drug and substance abuse, debt management and life skills. The descriptive statistics for counselling services showed a general agreement regarding the presence of activities regarding counselling and which were important to their performance. There was no wide variation amongst the responses gathered. Inferential statistics showed that there is a moderate positive linear relationship between counselling services and performance. In addition, regression analysis indicated that counselling services affect performance of Administration Police Officers.

5.0 Conclusion and Policy Implication

The study aimed at establishing the influence of counselling services on performance of Administration Police Officers. A positive linear relationship was found to exist between counselling services and performance. This implies that proper stress management, drug abuse therapy, debt management and life skills are likely to translate into improved performance of Administration Police Officers

Counselling services positively impact on the performance of Administration Police Officers. There may be need to ensure strategies on stress management, drug abuse therapy, debt management and life skills are put in place to ensure a good mental health of the police officers. Programs that seek to alleviate various stressors that police officers face may be necessary to help them in devising better coping strategies and at the same time ensuring a generally good mental health for Administration police officers.

5.1 Recommendations for Further Studies

The current study was conducted among Administration Police Officers in Nairobi County and their experiences maybe different from others outside Nairobi County which has improved forms of infrastructure. Another study may be conducted in rural counties where challenges of different nature are experienced. Furthermore, studies on other branches of police officers like the General Service Unit (GSU) and the newly established Maritime Police may need to be carried out to determine if similar experiences exist. Comparative studies may also be conducted to determine which places may need more attention in order to ensure uniform laying of strategy for welfare of police officers.

Influence Of Ict Weather Forecasting On Agricultural Productivity In Kenya: A Literature Based Review

Daisy Mbucu Ireri

Dr. James Ogalo

Dr. David Nzuki

Abstract

This study aims at establishing the influence of ICT weather forecasting on agricultural productivity in Kenya. The paper will use a desk study review methodology where relevant empirical literature will be reviewed to identify main themes and conclusion drawn based on the reviewed literatures. The study will be guided by the following specific objectives; to establish the ICT weather forecasting practices used on agricultural production in Kenya, to establish the extent of use of ICT on weather forecasting in Kenya and to determine the challenges hindering ICT weather forecasting on agricultural productivity in Kenya.Agriculture in Kenya is an important fundamental in economic development; it contributes 35% of the gross domestic product (GDP) and constitutes 40% of the export earnings. Thus, weather forecast helps farmers on many fronts such as helping them make informed decisions. Weather affects the entire agriculture chain, whether it is determining which seeds are most effective in certain soil conditions, helping farmers decide how much water to use for crops, or deciding how many crops to raise based on weather conditions at various level.Precision agriculture based upon weather analytics is becoming even more important.Information and communication technology in agriculture (ICT in agriculture), has been developing and applying innovative ways to use ICTs in the rural domain, with a primary focus on agriculture on weather forecasting. The study concluded thatclimate uncertainty also has a negative impact on the providers of credit and markets for productive inputs and can make it difficult for smallholder farmers to benefit from agricultural markets. Climate information reduces uncertainty and can help farmers make better use of new seeds and technologies. The study recommended that meteorologists should consider linkages with end users of forecast information to develop user-oriented products, communicate the information in the user's local languages (particularly the pastoral communities), and develop techniques for raising the awareness of the user communities on the benefits of using weather information in agricultural practices decision-making. The study recommends that weather forecasts be devolved to the counties in developing informed agricultural decisions. It further recommends that language and communication of the weather information be improved in temporal and spatial scales with the use of new and emerging technology. KMS should enhance its efforts in awareness creation and public understanding of weather services

Key words: ***ICT, Weather Forecasting, Agricultural Productivity & Kenya.***

1.1 Introduction

In Kenya, agriculture provides a livelihood for most of the 75 percent of the people who live in rural areas in Africa. At the same time, these areas have the largest concentration of poverty and food insecurity. Poverty as a result of low income is attributed to low productivity of agriculture. Agriculture in Kenya is key to the development of Kenya, contributing directly and indirectly to over 50% of the Gross Domestic Product (GDP). A significant fraction of government revenue is allocated to achieving food security in the country, thus, agriculture is given special emphasis in national development policies and strategies, including the Poverty Reduction Strategy Paper and Kenya Vision 2030. According to Kanui, Kauti and Mwobobia (2016), attempts to reduce poverty should therefore pay special attention to transforming the agricultural sector, especially sustained improvement of land and labor productivity in the sector, facilitated by remunerative markets.

Extreme weather and climate changes are a big risk factor in agriculture in Kenya. In most cases, good rains are followed by warm sunny days that get hotter and drier(Henze & Ulrichs, 2016). One of the great challenges of weather and climate science is estimating the probability of the occurrence, severity and duration of weather events, as well when and where the event will take place. This uncertainty poses major threats to small-scale farming in Kenya where about 80% of the population depend on rain-fed agriculture (Sibiko & Qaim, 2017). The harsh effects of climate change have continued to exacerbate enormous difficulties among the poor households who are risk averse, leaving them more vulnerable and food insecure in many months of the years(Krone, Dannenberg & Nduru, 2016). A sure knowledge base from systematic observation and forecasting services is therefore essential to monitor climate; detect and attribute climatic change; improve the understanding of the dynamics of the climate system and its natural variability; provide input for climate models; and thus plan adaptation options(Tata & McNamara, 2018).

In order to help meet these challenges, more investment in disaster risk reduction is needed, including building the capacity to anticipate risks and as well as provision of relevant and accurate weather and climate information services as an early warning strategy(Birch, 2018). Skillful seasonal climate forecasts can also help to not only reduce climatic uncertainty, but also reduce livelihood risk to farmers and fishers only if the uncertainty associated with the forecast is accurately communicated, understood and integrated into the decision process(Duncombe, 2018).

1.1 Background to the Study

The Kenya meteorological Department (KMD) is the primary source of weather forecasts, as well as of historical weather data records that are needed for index insurance services (KMD, 2018). In recent years, free and open data initiatives for weather and agriculture have emerged to help national meteorological agencies and commercial weather companies provide better weather forecasts in the developing countries.

According to Bendre, Thool & Thool (2015), modern-day skillful weather forecasts are based on the numerical weather prediction approach, involving computer-based modelling from a set of initial atmospheric and environmental conditions. Weather forecasting involves the application of current technology and science to predict the state of the atmosphere for a future time and a given location (Chithra, 2015). Weather forecasts are made by collecting as much data as possible about the present state of the atmosphere, which includes temperature, humidity, wind, and the understanding of atmospheric processes to determine how the atmosphere will evolve in coming weeks. Weather forecast accuracy can be very sensitive to the reality of the specified initial conditions, highlighting the importance of high quality observational data and its geographical coverage, both horizontally and vertically (Gollin, Lagakos & Waugh, 2014).

Over the centuries, as farmers have adopted more technology in their pursuit of greater agricultural productivity, the belief that 'bigger is better' has come to dominate farming, rendering small-scale operations impractical. Effective adoption of Information and Communication Technologies (ICT) has proven record in many parts of the world and a demonstrated potential to attain significant economic, social and environmental benefits at local, national and global levels (De Janvry, Macours & Sadoulet, 2017). The past four decades have witnessed numerous attempts to understand the mechanisms of the adoption of technological innovation.

ICT in agriculture has been developing and applying innovative ways to use ICTs in the rural domain, with a primary focus on agriculture. ICT in agriculture offers a wide range of solutions to some agricultural challenges. It is seen as an emerging field focusing on the enhancement of agricultural and rural development through improved information and communication processes (Gollin, Lagakos & Waugh, 2014). In this context, ICT is used as an umbrella term encompassing all information and communication technologies including devices, networks, mobiles, services and applications; these range from innovative Internet-era technologies and sensors to other pre-existing aids such as fixed telephones, televisions, radios, machinery and satellites.

ICT in agriculture continues to evolve in scope as new ICT applications continue to be harnessed in the agriculture sector. ICT in agriculture involves the conceptualization, design, development, evaluation and application of innovative ways to use ICTs in the rural domain, with a primary focus on agriculture. Provisions of standards, norms, methodologies, and tools as well as development of individual and institutional capacities, and policy support are all key components of ICT in agriculture (Palis, 2017).

Despite occurrences of drought with attendant crop failure and occasional famine, flooding with the attendant loss of human life and destruction of property and the impacts of other phenomena on socio-economic development, there has been very limited research done to quantify the benefit of weather and climate information and services. This study seeks to establish the influence of ICT weather forecasting on agricultural productivity in Kenya.

1.2 Statement of the problem

Agriculture in Kenya is an important fundamental in economic development; it contributes 35% of the gross domestic product (GDP) and constitutes 40% of the export earnings. Thus, weather forecast helps farmers on many fronts such as helping them make informed decisions (Kanui, Kauti & Mwobobia, 2016). Weather affects the entire agriculture chain, whether it is determining which seeds are most effective in certain soil conditions, helping farmers decide how much water to use for crops, or deciding how many crops to raise based on weather conditions at various level(Karanja, 2018). Precision agriculture based upon weather analytics is becoming even more important. Information and communication technology in agriculture (ICT in agriculture), has been developing and applying innovative ways to use ICTs in the rural domain, with a primary focus on agriculture on weather forecasting(Kibunja, Kihoro, Orwa & Yodan, 2014).

Almost every single activity in the modern world is becoming more dependent on the application of ICT for one use or another. Weather forecast accuracy can be very sensitive to the reality of the specified initial conditions, highlighting the importance of high quality observational data and its geographical coverage, both horizontally and vertically(Muriithi, Olago, Ouma & Oriaso, 2018). The predictability of weather conditions varies with time.Although Kenya Meteorological Services issues seasonal climate forecasts climate variability continues to affect life support systems on which small holder farmers depend, severely affecting not only households but also national food security and general social order in Kenya. However, it is complicated by the fact that the reaction of various agricultural plants to type and intensity of peculiar weather phenomena is different. This paper aimed to establish the practices in weather forecasting in Kenya and how it affects agricultural productivity where conclusions and recommendations are given.

1.3 Research Objectives

The study will be guided by the following specific objectives;

i) To establish the ICT weather forecasting practices used on agricultural productivity in Kenya.
ii) To establish the extent of use of ICT on weather forecasting inagricultural productivity Kenya
iii) To determine the challenges hindering ICT weather forecasting on agricultural productivity in Kenya

1.4 Research Questions

The study will be guided by the following research questions;

i) What are the ICT weather forecasting practices used on agricultural production in Kenya?
ii) What is the extent of use of ICT on weather forecasting on agricultural productivity in Kenya?
iii) Which are the challenges hindering ICT weather forecasting on agricultural productivity in Kenya?

2.1 Literature Review

In literature review, the study will review both the theoretical framework and the empirical review related to ICT weather forecasting and agricultural productivity.

2.2 Theoretical Framework

2.2.1 Theory of Technology Acceptance Model

Davis (1986) developed the Technology Acceptance Model that deals more specifically with the prediction of the acceptability of an information system. The purpose of this model is to predict the acceptability of a tool and to identify the modifications that must be brought to the system in order to make it acceptable to users. This model suggests that the acceptability of an information system is determined by two main factors: perceived usefulness and perceived ease of use. Perceived usefulness is defined as being the degree to which a person believes that the use of a system will improve his performance(Aubert, Schroeder& Grimaudo, 2012). Perceived ease of use refers to the degree to which a person believes that the use of a system will be effortless. Several factorial analyses demonstrated that perceived usefulness and perceived ease of use could be considered as two different dimensions.

Technology Acceptance Model postulates that the use of an information system is determined by the behavioral intention, but on the other hand, that the behavioral intention is determined by the person's attitude towards the use of the system and by his perception of its utility. According to Davis, the attitude of an individual is not the only factor that determines his use of a system, but is also based on the impact that it may have on his performance (Venkatesh, Thong & Xu, 2012). Therefore, even if an employee does not welcome an information system, the probability that he will use it is high if he perceives that the system will improve his performance at work. Besides, the Technology Acceptance Model hypothesizes a direct link between perceived usefulness and perceived ease of use. With two systems offering the same features, a user will find more useful the one that he finds easier to use.

According to Davis (1986), perceived ease of use also influences in a significant way the attitude of an individual through two main mechanisms: self-efficacy and instrumentality. Self-efficacy is a concept developed by Bandura (1982) which explains that the more a system is easy to use, the greater should be the user's sense of efficacy. Moreover, a tool that is easy to use will make the user feel that he has a control over what he is doing. Efficacy is one of the main factors underlying intrinsic motivation (Marangunić & Granić, 2015). and it is what illustrates here the direct link between perceived ease of use and attitude. Perceived ease of use can also contribute in an

instrumental way in improving a person's performance. Because the user will have to deploy less effort with a tool that is easy to use, he will be able to spare efforts to accomplish other tasks.

The technology acceptance model theory is relevant as it specifies behavioral beliefs, perceived usefulness and perceived ease of use, as determinants of attitude towards behavioral intentions and IT usage behavior. In TAM, behavioral intention to use, leads to actual ICT usage behavior. Behavioral intention is determined jointly by attitude and perceived usefulness, where perceived usefulness also affects attitude directly. The theory assists to portray how technology adoption in agriculture could be used to bring out improved productivity.

2.2.2 Bob Doppelt Theory

Doppelt theory proposed in 2008 argues that global warming is not, at its core an energy, technology or policy problem. It is the greatest failure of thought in human history. He points out that global warming and today's other environmental, social and economic problems therefore cannot be resolved merely through more-efficient technologies or cap-and trade policies. Fundamental change in thinking and perspectives will be needed (Doppelt, 2017).

This theory holds that a sustainable development model focuses on economic sustainability, which involves the development of a healthy economy that supports and sustains people and the environment over the long-term. This theory shows that in a market driven economy, cost is a deciding factor in determining whether a project moves forward(Pike, Doppelt & Herr, 2013). To be sustainable, projects must not only provide environmental and social benefits but also offer economic value. This theory relates to this study in such a way that forecast application is highly dependent on how people think about it, the action taken and therefore the outcome. Based on these ideas, farmers‟ perception of any forecast is affected by their way of thinking (Doppelt, 2017). The actions taken in terms of response strategies to the forecasts are dependent on availability of the resources. This could either enhance forecast use or impede its application. This in turn has a greater effect on the outcome of any agricultural practice, there by influencing the food security situation in the region and in the country as a whole.

This therefore means that forecast application by farmers will be increased if information about how it should be used is downscaled to the poor rural small holder farmer. This could influence how they perceive it and therefore their willingness to use it in their farm level decision making.The economic value attached to it due to improved production, income and food security could eventually encourage farmers to be more willing to use the forecast in order to improve their productivity, food security and therefore income.

2.3 Empirical Review

The empirical literature was reviewed on ICT weather forecasting practices, extent of use of ICT on weather forecasting and the challenges hindering ICT weather forecasting.

2.3.1 ICT Weather Forecasting Practices

Kenya Meteorological Department (KMD) is the institution that is mandated to collect and store climate data in Kenya. Data collection is undertaken through the climate observing stations operated by the institution and also through collaboration with other institutions and volunteer observers (KMD, 2018).

The Numerical Weather Prediction (NWP) section of the Kenya Meteorological Department is one of the sections within the Forecasting Division of the Department. The computer models used for numerical weather prediction calculate the formation, growth, movement and decay of the systems within which weather events, including severe weather, are embedded. The models are complex and integrate fluid motion, thermodynamics and radiation on a rotating globe that includes topography, land and seas differences and the diurnal cycle. In addition, mathematical schemes for representing very small-scale processes, such as cloud and turbulence are included (KMD, 2018).

According to Masinde, Bagula and Nzioka (2013), extensive weather station networks are needed for monitoring key climate parameters such as wind speed, precipitation, barometric pressure, soil moisture, wind direction, air temperature and relative humidity. These parameters may be used both for forecasting and for decadal climate modelling. The technologies needed include weather satellites and both local and remote automated weather stations. Satellite observations include: visible spectrum cameras to detect storms and deforestation; infrared cameras to detect cloud and surface temperatures and sea level rise; particle detectors of solar emissions (KMD, 2018). The accuracy of climate (general circulation) models, is being continuously improved through better understanding of the basic science (including the impacts of clouds, for example); advances in the technology, as observed by Moore's law, whereby the processing power of computers doubles every two years, and by more extensive data gathering through weather and environmental sensors connected to telecommunication networks. In order to make relevant information available to local communities these models are being extended to predict changes in regional and local weather and sea level extremes (KMD, 2018).

Ochieng, Recha and Bebe (2017) conducted to assess use of seasonal climate forecasts as strategies for securing pastoralists assets in arid and semi-arid lands (ASALs) of Baringo County. The study used five (5) study locations that were purposively picked to ensure that they fall within the ASAL agro-ecological zones, LM5 and IL6. The total sampled households from the five locations was 221. The study used data from household survey to establish barriers to use of seasonal climate forecasts, use of traditional climate information and enabling conditions. Mean comparisons and frequencies of ratings were generated to ascertain the use of traditional climate information among the respondents. Sensitivity analysis was useful in identifying the most significant barriers to uptake of seasonal climate forecasts and the best and most significant enabling conditions/institutions to the access and usage of climate forecasts. The study established that majority (72.4%) of the respondents relied on traditional climate forecast methods than scientific methods in decision-making. The factors with greater influence on uptake of seasonal climate forecast information were lack of information, access, diversified sources of income and insecurity/conflicts, illiteracy and culture. The institutions with large influence were knowledge dissemination linked to radio and extension services and local climate information.

In Kenya, many communities rely on indigenous knowledge for agriculture, food processing and storage, but indigenous forecast methodshave not been ventured in as an important resource for enhancing agricultural production in most areas (Kanui, Kauti & Mwobobia, 2016). Kenya being an agricultural country that depends on rain-fed agriculture requires maximum use of seasonal climate forecast. The regional nature of seasonal forecast may limit their relevance for planning at national and local level. Finer scale forecast and more fine-tuned early warning systems, accompanied by a rapid delivery of information is needed (Gollin, Lagakos & Waugh, 2014). Kenya Meteorological Services (KMS) is responsible for monitoring and forecasting weather and climate in Kenya, including seasonal forecast. In spite of the slight improvement in forecasting accuracy, the present forecasting accuracy, which is 75%, is still not sufficient as challenges are still numerous due to the strong spatial and temporal variability nature of weather events. These scientific forecasts are formulated at a much larger scale, diverging with local needs.

Kenyan farmers have relied on traditional weather forecasting for generations. Some fear these methods will be discarded as climate change brings more extreme and unpredictable weather(Guthiga & Newsham, 2011). Others say that indigenous knowledge and methods remain valuable especially when used together with modern science. The Kenya Meteorological Department infers that traditional practices have something to offer. The Department now blends these forecasts with science-based predictions. The result is more accurate and better-received local weather forecasts in most regions of Kenya. The Department uses satellite technology and other modern methods to produce forecasts(Luseno, McPeak, Barrett, Little & Gebru, 2013).

Kenya; for example, localized flooding, droughts, and lightning strikes are observed in parts of the country almost every year. These extreme weather events in the country are often associated with very severe socioeconomic impacts that include lack of food, water, energy, and many other basic needs including destruction of infrastructure

as well as loss of lives(Muriithi, Olago, Ouma & Oriaso, 2018). Such impacts havetended to retard socioeconomic growth of the country with the ultimate enhancement of poverty. Currently, majority of the rural communities live under dire poverty since agriculture on which they depend for their livelihood has become more and more sensitive to severe and extreme weather events(Sagero, Shisanya, Ongoma & Shilenje, 2016).

Different regions require different weather information. KMS produces various forecasts and early warning products(Gichangi, Gatheru, Njiru, Mungube, Wambua & Wamuongo, 2015). They include historical and past climate records, real-time and near-real-time weather information, now casting for airport services, short-range weather forecasts, medium- range weather, long-range weather forecasts, and climate predictions. KMS also provides climate change information and severe weather advisories. This information helps in identifying suitable activities for specific areas and period to reduce weather related risks.

2.3.2 Extent of use of ICT on Weather Forecasting

According to Daniel and Cheserek (2018), pastoral communities have used indigenous forecasting methods for a long time to predict seasonal climatic events. Some pastoral communities observe clouds, wind and lightning that likely have their origins in traditional understandings of what contemporary researchers recognize as atmospheric science. Others watch the behavior of livestock, wildlife and the local flora. Indigenous early warning signs of weather changes are not only limited to livestock-keeping communities.

According to Musembi and Cheruiyot (2016), most of the products of KMS are highly time sensitive and thus need to be disseminated to the users in the fastest modes possible. Faster communication of weather information has proved to be a major challenge to many weather organizations, although Kenya has developed a vibrant communication system. The channels used in the dissemination of the meteorological products in KMS include press releases, interaction with media personnel, radio and TV channels, email services, government line ministries, website, and social media. At the county levels where KMS has now decentralized its services, the information flow channels are offices of the county directors of meteorology, radio, and Internet communications project, Community Based Organizations, sub county development committee meetings, and chiefs' "barazas."

Shilenje and Ogwang (2015) finds that partnership between the Kenya Meteorological Department and community radio stations is bringing weather alerts to four parts of Kenya. The stations are operated by the Radio and Internet Communication System, or RANET. They broadcast to Kangema, Narok in the Rift Valley, Budalangi in western Kenya, and Kwale in the coastal region.However, many communities still rely on traditional forms of climate forecasting by mainly using environmental, meteorological and astronomical indicators. Local communities have developed intricate system of gathering, predicting, interpreting and decision making in relation to weather.

Liang (2017) finds thatchanges in weather patterns, coupled with the increased frequency and intensity of severe weather are resulting in fewer growing days rendering traditional farming methodologies increasingly less reliable. Local residents in most cases do not understand the meteorological forecast. Despite modernization and global change, indigenousmethods used to predict weather still play an important role in decision making in rural livelihoods.

2.3.3 Challenges hindering ICT Weather Forecasting

According to the Kenya Meteorological Department (2018), weather forecasting for agricultural use faces various challenges. The observation network is not well distributed throughout the country. Such distribution is necessary in order to observe smaller scale climate conditions that are influenced by small scale features such as topographical variations among others. The optimum number requirement of synoptic stations is seventy seven. The Department is faced with inadequate funds to purchase consumables whose cost is increasing. For this reason upper air observations in Garissa and Lodwar are currently not active and the Dagoretti one operates only once a day instead of twice as required. There is an inadequate technical capacity for operation and maintenance of equipment. There is lack of necessary infrastructures such as electricity, or access roads in some important observing stations. The

department is faced with insecurity in some of the areas where observation sites are located. Some of the equipment was installed a long time ago but there are inadequate funds for their rehabilitation or replacement. The Department does not have adequate personnel as required in order to efficiently carry out observation obligations. Data collected by volunteer observers is not collected on a regular basis as required perhaps because the observers have other commitments (KMD, 2018).

According to Mwaniki and Stevenson (2017), KMS lacks modern facilities for data analysis and integration of products necessary to overlay various products for realization of more accurate forecasts. There therefore is a need to improve and refine the weather models used and enhance the capacity in numerical weather prediction and dynamical modelling as well as the remote-sensing techniques. Ultimately, KMS should acquire modern facilities for data analysis and information presentation.

Karanja (2018) finds thatthere is limited clarity on what forecast formats are best suited to user needs although it is known that the optimal format may vary between applications. Use of information, once received, is not straightforward and if inappropriately used may lead to further difficulties. Production and delivery systems are somewhat fragmented and consequently it is sometimes difficult for forecasts to reach those end users who may have particular need for the information. End users often perceive a need for temporal and spatial detail (e.g., exact rainfall amounts, onset, and cession dates) in the prediction that currently cannot be achieved with much accuracy(Shilenje & Ogwang, 2015). Best method from the scientific perspective of delivering outlooks is through probabilistic approaches. Probability forecasts, however, are often viewed as being difficult to understand and act upon.

2.4 Conceptual Framework

The conceptual framework provides a diagrammatical illustration that shows the connection between the independent and dependent variables. The figure below depicts the relationship between ICT weather forecasting and Agricultural production as shown ion Figure 1.

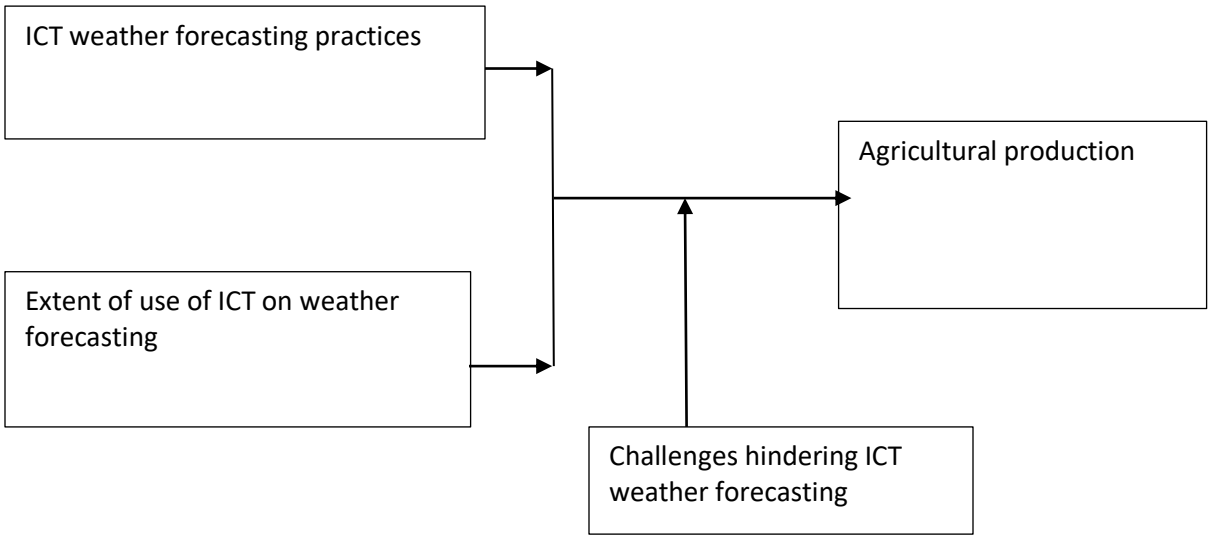

Figure 1: Conceptual Framework

3.0 Research Methodology

The study sough to establish the influence of ICT weather forecasting on agricultural productivity in Kenya. The paper used a desk study review methodology where relevant empirical literature was reviewed to identify main themes. A critical review of empirical literature was conducted to establish the influence of ICT weather forecasting on agricultural productivity in Kenya.

4.0 Results and Discussion

The socioeconomic wellbeing of the Kenyan communities is very sensitive to severe weather and extreme climate events. The country often experiences loss of life and destruction of property because of severe weather events such as floods and landslides, wind gusts, lightning, and prolonged droughts.

A large percentage of the rural communities within the country live below the poverty line since rain-fed agriculture, on which they rely for their livelihood has become more and more sensitive to severe weather that is now prevalent. Skillful and timely weather forecasts can help the government and communities mitigate the negative impacts of severe weather events through proper planning. This is the essence of an effective early warning system. The basic idea behind early warning is that the earlier and more accurately we are able to predict the likelihood of occurrence of natural and human induced hazards, the more likely we will be able to manage and mitigate a disaster's impact on society, economies, and environment. The warning lead-time should be sufficient to allow appropriate measures to be put in place.

Effective climate services rely upon locally relevant climate data tailored to farmers' needs. Under-resourced national meteorological services need support to be able to supply such information over large areas. Forecasts must reach remote rural communities in time for farmers to make use of them. Mobile phones and rural radio have been successfully used to convey weather information to a very large audience. Nevertheless, personal interactions are probably most effective for communicating complex climate messages.

Monitoring, prediction, and timely early warning of the aforementioned extreme events are favorable strategies for mitigating their negative impacts on humanity and property. This therefore calls for the existence of an effective and efficient early weather warning system. By definition, early warning provides timely weather information that allows individuals, organizations, or communities exposed to likely hazards take action that avoids or reduces their exposure to risks. An early warning system therefore involves data collection, information development, modes of dissemination, and action triggering mechanisms.

5.0 Conclusions

Climate uncertainty also has a negative impact on the providers of credit and markets for productive inputs and can make it difficult for smallholder farmers to benefit from agricultural markets. Climate information reduces uncertainty and can help farmers make better use of new seeds and technologies. Such information can be used to support complex and context-specific decisions about farm labour and resource allocation. Climate information should be accompanied by services that communicate, train and help users understand how to interpret and act on the information.

Changes in weather patterns, coupled with the increased frequency and intensity of severe weather are resulting in fewer growing days rendering traditional farming methodologies increasingly less reliable. Local residents in most cases do not understand the meteorological forecast. It was clear that despite modernization and global change, indigenousmethods used to predict weather still play an important role in decision making in rural livelihoods. The study also concluded that farmers‟ perception of the forecast has an influence on how they would use these

forecasts. Majority of the farmers rely on indigenous knowledge in weather prediction because of how they perceive it. They perceive indigenousmethods forecasting methods to be more reliable than the scientific ones. Furthermore, the study revealed that socio-economic status of a farmer may impede or enhance the use of climate forecast information.

6.0 Recommendations

To overcome the challenges, meteorologists should consider linkages with end users of forecast information to develop user-oriented products, communicate the information in the user's local languages (particularly the pastoral communities), and develop techniques for raising the awareness of the user communities on the benefits of using weather information inagricultural practices decision-making. There is need for improvement of the modes of communication, for example, short messaging service (SMS) and common alerting protocol. Through collaborating with intermediaries, KMS is able to disseminate weather information services to county and sub county levelsusing modern technology available, that is, SMS at reasonable speed and cost.

The study recommends that weather forecasts be devolvedto the counties in developing informed agricultural decisions. It furtherrecommends that language and communication of theweather information be improved in temporal and spatialscales with the use of new and emerging technology. KMSshould enhance its efforts in awareness creation and publicunderstanding of weather services. This leads to increaseduptake and confidence in applying the weather knowledgein agricultural planning and alleviating risks on societies. Partnerships between public and private sectors are enhanced by sharing lessons learnt and efforts being made to mitigate weather related hazards and protect crops.

Technical Capacity In Project Implementation And Sustainability Of Water And Sanitation Projects In Nyeri County, Kenya

David Gathogo Kamau[1]
Department Of Management Science, Kenyatta University
John Njangiru Mungai (Phd)[2]
Department Of Accounting And Finance, Kenyatta University

Abstract

The perceived success in project implementation is more adequately defined as meeting the project's technical specification or mission while at the same time attaining a high level of satisfaction on the part of the community, clients, users and the project team. The end product must perform satisfactorily in service. This means that parties associated with and affected by a project should be satisfied at the same time that the good cost and schedule performances are realized. This study intended to establish effect of technical capacity in project implementation on sustainability of water and sanitation projects in Nyeri County. Water and sanitation provision coverage has remained low even with continued investment by the Government and donor agencies in the sector through various projects. Water Services Regulatory Board (WASREB) through its annual reports on water and sanitation provision status has queried the disparity between the amount of investment towards water and sanitation projects and the corresponding rate of growth in the service coverage. The study sought to determine effect of technical capacity in the implementation of water and sanitation projects in Nyeri County on the sustainability of such projects. The target population consisted of 94 members of the community made up of managers of water service providers (WSPs), administrative and community leaders. A sample size of 40% of the target population was drawn. Stratified random sampling design was adopted to select the respondents. The study used a cross sectional descriptive survey research design using quantitative approach to data collection, analysis and reporting through some elements of qualitative approach to data. Data was collected using questionnaires and analyzed quantitatively with the aid of the Statistical Package for Social Science (SPSS). Analysis of results indicated below standard levels of sustainability of water and sanitation projects as indicated by water quality and operations and maintenance cost coverage. However, the hours of water supply as a dimension of sustainability was found to be within the benchmark standards set by regulators. R squared, the Coefficient of Determination stood at 60.80, indicating that 60.80% of variation in sustainability of water and sanitation projects was explained by Technical Capacity project implementation variable in a model. One Way Analysis of Variance and Regression analysis results indicated that technical capacity have a positive and statistically significant effect on sustainability of water and sanitation projects in Nyeri County, Kenya. The study recommends that project management teams device ways to upscale the quality of water supplied and operations and costs coverage which was poor.

Key words: ***Technical Capacity, Project Management Competency, Water and Sanitation Projects***

1.1 Background of the Problem

Lack of improved water and sanitation sources remains a serious world health and environmental issue. Over 1.1 billion people use water from unimproved sources, and 2.4 billion have no access to any form of improved sanitation (United Nations, 2015). According to the World Health Organization (WHO), achieving the Millennium Development Goals (MDGs) drinking water and sanitation target poses two major challenges: a rapid pace of urbanization, which requires major effort even to keep up the current coverage levels; a huge backlog of rural people unserved with basic sanitation and safe drinking water, which calls for an intensive mobilization of resources to reduce the vast coverage gap. The lack of sanitation services is also compounding problems of environmental degradation and associated poverty levels around the world. In response to this crisis, international organizations have listed water and sanitation interventions among the top development priorities.

To achieve this, investment in water and sanitation projects especially in the developing countries need to be enhanced. According to Korir(2012), the process of project implementation involves the successful development and introduction of projects in the organization. The project implementation process is complex, usually requiring simultaneous attention to a wide variety of human, budgetary and technical variables. Sustainability of water and sanitation projects largely depends on the implementation of the specific projects which could be affected by such variables as technical capacity.

1.1.1 Technical Capacity

This is the capabilities and resources available to the organization and the project implementation team to ensure achievement of the desired or intended output or outcome of the project. These include professional qualification of members of project implementation team, availability of necessary plant and equipments, technical designs of the project and work plans. For successful implementation of a project it is paramount to have qualified engineers, surveyors, accountants, and other technical staff to ensure quality work done meet required standards and that financial aspects of the project are adequately covered. The resources may be owned by the organization or can be out-sourced depending on the underlying factors (Montegomery & Elimelech, 2009).

In particular, without properly trained human resources, even a well-financed project that is characterized by advanced technology might not be sustainable in the long term in relation to providing customers with adequate and clean water (Ademiluyi & Odugbesan, 2008).

1.2 Statement of the Problem

According to Water Services Regulatory Board (WASREB) reports, in Nyeri County, it is only 40% of the population who have access to clean drinking water with sewerage coverage within urban centres in the county at about 35%. During the last 10years the county has benefited from funding to undertake water and sanitation projects both from the Government and other organizations such as Japan International Cooperation Agency (JICA), the World Bank and Water Services Trust Fund (WSTF). Though this has translated into improved water and sanitation coverage in some parts of the county, most of the projects do not achieve the desired results hence overall poor service provision. WASREB through its annual reports on water and sanitation provision status has queried the disparity between the amount of investment towards water and sanitation projects and the corresponding rate of growth in the service coverage.

This study therefore sought to evaluate the effect of technical capacity of the project implementation team in the implementation of water and sanitation projects that may affect the economic, environmental and social sustainability of such projects.

1.3 Objectives of the Study

To examine effect of technical capacity in project implementation on sustainability of water and sanitation projects in Nyeri County.

1.4 Research Questions

How does technical capacity in project implementation affect sustainability of water and sanitation projects in Nyeri County?

2.0 Theoretical Literature
The study was guided by the following theories.

2.1McKinsey 7s Model
Water and sanitation projects must have all the seven elements of McKinsey 7s model including strategy, structure, skills, style, staff, shared values, and systems.

This theory was therefore relevant to this study as the seven elements of an organization can be seen to influence the level of technical capacity within an organization that may affect implementation of water and sanitation projects hence their sustainability of the said projects.

2.2 Porter's Value Chain Model
The value chain model can be employed in project management to make certain that a project creates value for the intended customers. In particular, Porter's value chain enables project managers to understand how much value the project teams have put into any given project

2.3 Empirical Literature

2.3.1 Sustainability of Water and Sanitation Projects
In relation to community water and sanitation projects, sustainability entails the capacity of a water and sanitation project to meet the present needs of a community as well as those of the future generations. To attain this goal, the projects outputs and services must be maintained at a continuous interval paying significant attention to the original aims and objectives. Water and sanitation projects are planned and executed with the aim of promoting access to clean water for consumption and improving the health of the intended communities. While the implementation of such projects is always successful in many parts of the world, their sustainability has always been a significant challenge (Mulwa, 2004).

With respect to sustainability of water and sanitation projects, Water Services Regulatory Authority outlines the various key performance indicators that are used to establish whether a service provider or project is sustainable. These include water quality, hours of water supply, coverage of revenue on operation and maintenance costs.

Table 2.4: Key performance indicators of water and sanitation projects

Performance Indicator	Acceptable level
Water quality	>95%
Hours of Supply	17-24Hrs
Operation and Maintenance Cost Coverage	≥150%

Source: WASREB Impact Report (2017)

2.3.2 Technical Capacity and Sustainability of Water & Sanitation Projects
There are critical links in implementation and sustainability of water and sanitation projects with technical capacity of the implementing individuals, organisations and community members (Korir, 2012).

2.3.2.1 Organizational and Community Training.
Human resource development is part of the technical capacity required to promote the sustainability of community water and sanitation projects. Under this perspective, human resource development entails the provision of specialized training of the project staff, project managers, and community members as part of the project team that will facilitate project success and sustainability (Montegomery & Elimelech, 2009). However, the study is inadequate on establishing measures of promoting functional sustainability of water and sanitation services.

Comparable thoughts are echoed by Ademiluyi and Odugbesan (2008) after conducting a study on sustainability of community water and sanitation projects. The study established that the provision of community members with training on issues relating to operation and maintenance empowers the

community to run the project effectively as a prerequisite for sustainability. From these results, the study concluded that for the sustainability of water and sanitation projects to be attained, community members must be equipped with the skills of operating, repairing, and maintaining the water supply system. However, the researcher failed in clearly demonstrating how implementer of water and sanitation projects could be well equipped technically.

2.3.2.2 Project Management Competency.

Project management competency is an integral part of the technical capacity required in project implementation to promote project success and sustainability. When dealing with rural-based or community projects, project management entails aligning the project execution with the priorities of the local community. According to the views of Weinberg (2008), community projects are very multifaceted and as such call for versatile or adaptable management skills if success and sustainability are to be attained. The study further ascertains that the project manager is expected to apply not only the skills related to project management but also the technical expertise required to address the complexity of the project. There is a feeling however that, these views do not consider implementation of water and sanitation projects in rural area.

As noted by Macharia *et al.* (2015), the project manager must meet the required technical capacity to make effective decisions that will have a positive effect on project success and sustainability. In the same vein, the project manager must have and demonstrate a high level of comprehension of the goals or objectives of the project at hand. This goes a long way in instilling confidence to the project team. However, these views do not demonstrate clearly the interrelation between technical skill of project team and the sustainability of such projects upon successful completion.

2.4 Summary of Literature Review & Gaps

Table 5.2: Literature review summary and gaps.

Author	Title	Methodology	Findings	Recommendations	Gap	Gap filled
Macharia, Mbassana& Oduor, (2015).	Assessing Sustainability of Rural Water Projects in Naivasha, Kenya, Case Study: Maraigushu Water Project.	Mixed method (qualitative & quantitative designs).	Sustainability of community water projects is dependent of several factors including community participation, technical factor, and management factor.	Management efficiency, participation of community members, and building the capacity of locals are all important determinants of sustainability in rural-based water and sanitation projects.	Lack of understanding of the factors promoting sustainability of rural water projects.	Identification of the factors promoting sustainability of rural water projects including community participation, technical factor, and management factor.
Aftab,Ismail,& Ade, (2012).	Time and Cost Performance in Construction Projects in Southern and Central Regions of Peninsular Malaysia	Structured questionnaire survey with quantitative research design.	Time and cost performance is the fundamental criteria for the success of any project.	Need for the implementation of the mitigation measure at the planning stage with the view of attaining success in project execution.	Lack of adequate studies on time and cost performance in construction projects.	Identification of time and cost performance as fundamental criteria for the success of any project.
Kahariri,(2014).	Assessment of the challenges of water supply and	Structured survey questionnaires with	Overpopulation, infrastructural developments, depleted water	Use of temporary water storage measures including tanks,	Inadequate studies dealing with the challenges	Established the challenges facing supply

	sanitation in uncontrolled residential developments of Huruma estate, Nairobi County.	quantitative research design.	towers, and inadequate dump sites affect the supply of water and sanitation adversely.	extension of water pipes to deliver water to all, and establishment of community led sanitation measures.	of supply of water and sanitation services in the slum areas.	of water and sanitation services in the slum areas and identified potential management strategies.
Keli, (2015).	Factors influencing sustainability of donor funded community water projects: A case of Kitui central constituency, Kitui County Kenya.	Survey questionnaires and quantitative analysis through descriptive and inferential statistics.	Strong positive correlation between community participation, community capacity building, community management and sustainability of donor funded community water and sanitation projects.	Need for community participation, community capacity building, and community management to promote the sustainability of donor-funded water and sanitation projects.	The sustainability of donor-funded water and sanitation projects has been understudied.	Adding to the inadequate body of research on the factors affecting the sustainability of donor funded water and sanitation projects.

2.5 Conceptual Framework

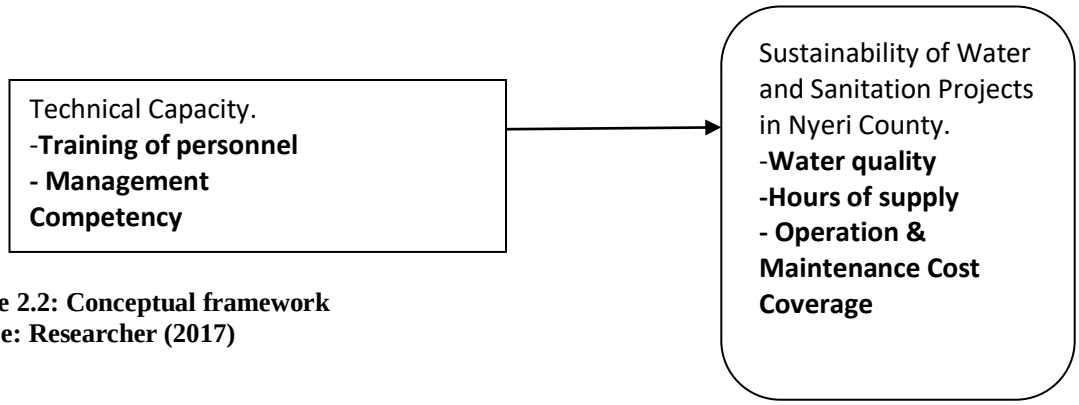

Figure 2.2: Conceptual framework
Source: Researcher (2017)

3.0 RESEARCH METHODOLOGY

3.1 Research Design

The study will adopted a cross sectional descriptive survey research design using quantitative approach to data collection, analysis and reporting through some elements of qualitative approach to data. This design is preferred as it will ensure complete description of situation making sure that there is minimum bias in data collection and that data is collected in an economical way (Mungai *et al*, 2014).

3.2 Target Population

The study target population included the stakeholders of water and sanitation projects within Nyeri County. All stakeholders including the management staff of WSPs, water project managers, community leaders and community leaders within the county. These stakeholders are identified as potential participants for this study because they have significant experience in relation to the implementation and sustainability of water

and sanitation projects within Nyeri County, Kenya. Within Nyeri County, the existing water and sanitation companies have their operations within five main regions that include Nyeri town, Mathira, Othaya-Mukurweini, Tetu-Aberdare, and Naro Moru. The research population is thereby spread across these main regions or clusters. The information on target population was obtained from Tana Water Services Board (TWSB). In total, the target population will be **94** structured as follows;

Table 6.1: Target Population

Region	Number of Departmental/Section Heads in area WSP	Number of Water Projects Managers	Number of Wards Administrators	Total
Nyeri	6	-	5	11
Mathira	6	15	6	27
Othaya-Mukurweini	6	8	10	24
Tetu	6	6	3	15
Naromoru/Kieni	4	5	8	17
Total	28	34	32	94

Source: County Government of Nyeri (2017)

3.3 Sampling Strategy

In this study, purposive stratified simple random sampling was applied. Managers from WSPs, project managers or leaders from each project within Nyeri County and community leaders from each ward in the county forms the population for the study. From the population, a 40% sample was selected randomly of each stratum.

Table 3.2: Sample size

Region	Population frequency	Sample ratio	Sample size
Nyeri Town	11	0.4	4
Mathira	27	0.4	11
Othaya - Mukurweini	24	0.4	10
Tetu	15	0.4	6
Naromoru/Kieni	17	0.4	7
Total	**94**		**38**

Source: Researcher (2017)

3.4 Data Collection Instruments

This study relied on structured questionnaires in the investigation of project implementation and sustainability of water and sanitation projects in Nyeri County. In the study, the structured questionnaires were used as they are advantageous in the sense that they facilitate the collection of data from a large number of research participants.

3.5 Data Collection Procedures

This study relied on both primary and secondary data. The primary data was obtained through the use of structured questionnaires while secondary data was sourced from reports and documents containing relevant information for the study. These were obtained from various institutions at the county and national level.

3.6 Data Analysis and Presentation

The first step in the analysis process was data cleaning. All the ambiguous elements in the questionnaires were eliminated in this step. This was followed by data coding. Data coding helped in summarizing and reducing the collected data and thereby simplifying the data analysis process. The SPSS program was then used to generate descriptive and inferential statistics. The descriptive statistics that were generated in this process included the percentages, frequencies, mean, median, mode, and the standard deviation. The inferential statistics generated included Analysis of Variance (ANOVA) and multiple regression analysis. The multiple regression model was used with the following function;

$Y= \beta_{0+} \beta_1 X_1 + \beta_2 X_2 + \beta_3 X_3 + \beta_4 X_4 + \varepsilon$

ISBN 978-9966-132-53-6 @ Copy Right .2019

Where β_0 - Y intercept
$\beta_1, \beta_2, \beta_3, \beta_4$ are coefficients
X_1 - Technical capacity
X_2 - Project funding
X_3 - Community participation
X_4 – Government Support
Ɛ - Error Term

4.0 RESEARCH FINDINGS AND DISCUSIONS

4.1 Response rate

The response rate gives an indication of how successful the process of data collection was. The response rate is further evaluated for adequacy against thresholds recommended in literature.

Table 4.1: Response Rate

Targeted respondents	Responses received	Response rate
94	80	85.11 %

Source: *Survey data (2018)*

Mugenda and Mugenda (2003) posit that a response rate of above 50% would consider adequate, 60% good and above 70% very good.

Table 4.2: Participants' Region

		Frequency	Percent
Valid	Nyeri Town	10	12.5
	Mathira	20	25.0
	Othaya/ Mukurweini	22	27.5
	Tetu	11	13.8
	Naromoru	17	21.3
	Total	80	100.0

Source: Survey data (2018)

Approximately half (52.5%) of the respondents were from Mathira and Othaya/ Mukurweini regions. An additional 21.30% and 13.8% of participants were from Naromoru and Tetu respectively. The least number of respondents was registered in Nyeri town region at 12.5%. The responses conformed to patterns expected as reflected in line with the target population.

4.2 Sustainability of Water and Sanitation Projects

This section presents descriptive statistics on sustainability of water projects. The factor constitutes the dependent variable of the current study. The dimensions of interest include quality of water, hours of supply and coverage of operational and maintenance costs. Table 4.3 presents statistics regarding the quality of water supplied by water projects in Nyeri County, Kenya.

Table 4.3: Quality of Water Supplied

	N	Minimum	Maximum	Mean	Std. Deviation
Water Quality (%)	5	39.00	96.00	83.2000	24.74268
Valid N (listwise)	5				

Source: *Survey data (2018)*

Analysis of data from WASREB's Impact Report (Issue no. 10 published in 2018), indicates that the quality of water supplied by regulated water projects was below standard as shown by the mean of 83.20%. As demonstrated by the minimum value, some players could be posting very low level of water quality (39.0%) which is far much below the recommended threshold. From the results, it is clear that most water projects did not meet the quality standards set by WASREB (2017) which stands at more than 95.0% (Acceptable Quality > 95%).

To incorporate the condition of quality of water provided by other providers not regulated by WASREB, the study also analysed primary data provided by respondents on the same subject. As evident from the results, most of the respondents (56.25%) opine that the quality of water supplied was below standard. This agrees with the WASREB (2018) whose report of regulated projects indicates a similar condition.

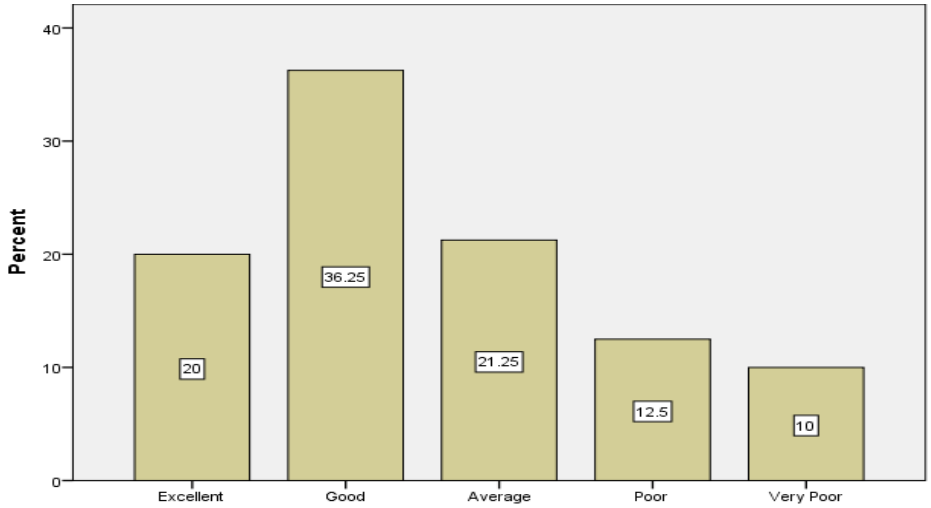

Figure 4.1: Quality of Water Supplied by Companies/ Projects

Source: *Survey data (2018)*
Secondary data was also collected regarding the hours of water supply by the water companies. Table 4.4 provides the statistics.

Table 4.4: Hours of Water Supply (Hrs per Day)

	N	Minimum	Maximum	Mean	Std. Deviation
Hours of Supply (Hours per day)	5	22.00	24.00	23.0000	1.00000
Valid N (listwise)	5				

Source: *Survey data (2018)*
Results of the analysis of secondary data by WASREB's Impact Report (Issue no. 10 published in 2018) demonstrated a good state of water provision to users by regulated water service providers. On average, water was available to users at least 23 hours per day. The least provision by any one regulated provider was 22 hours per day. As indicated by the maximum, in some case water was availed to users throughout the day. WASREB (2017) set the acceptable threshold at between 17 to 24 hours, a condition that is observed. The data does not however reflect the condition for unregulated water service providers or projects.

To reflect the condition of hours of water supply for other firms or projects not regulated by WASREB, the study involved analysis of primary data on the subject matter. More than half of the respondents (58.75%) agreed that the hours of water provision was above average standing at either between 16 hours to 20 hours or 21 hours to 24 hours. A further 12.50%, 12.50% and 16.25% indicated that water was supplied for 11-15 hours, 6-10 hours and below 6 hours respectively. The condition indicates that the acceptable standards of water supply (17-24hrs) are observed by majority of the projects. The statistics however contrasts with WASREB's Impact Report (2018) which reflects water provision almost throughout the day.

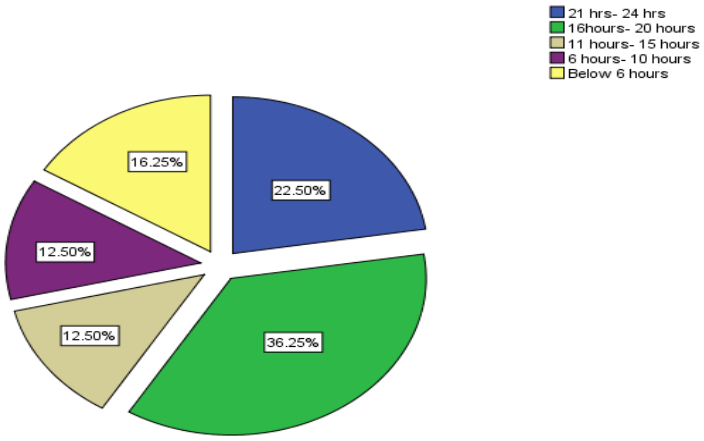

Figure 4.2: Number of Hours that Users are supplied with Water
Source: *Survey data (2018)*
Secondary data was also collected and analysed regarding the coverage of operations and maintenance costs by the water service providers and or projects.

Table 4.5: Operations and Maintenance Costs Coverage

	N	Minimum	Maximum	Mean	Std. Deviation
Operation and Maintenance Cost Coverage (%)	5	78.00	145.00	105.2000	24.41721
Valid N (listwise)	5				

Source: Survey data (2018)
Analysis of secondary data from WASREB's Impact Report (Issue no. 10 published in 2018) indicates a below standard performance regarding operations and maintenance cost coverage for water projects in Nyeri County, Kenya. The data does not however reflect the condition for unregulated water service providers or projects.

To further incorporate the condition of coverage of operations and maintenance costs by water companies and projects not necessarily regulated by WASREB, the study involved analysis of primary data on the subject matter. Figure 4.6 shows respondents opinion on whether the water companies or projects were able to meet their operations and maintenance costs. More than three quarters (78.75%) of the participants indicated that the companies or projects were able to meet their operations and maintenance costs.

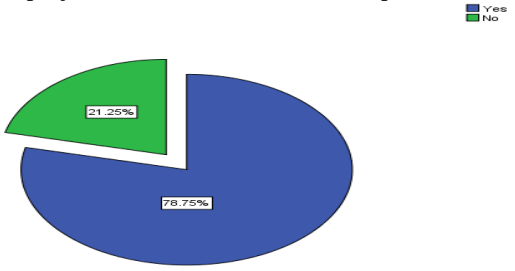

Figure 4.3: Coverage of Operation and Maintenance and Operations Costs
Source: Survey data (2018)
Figure 4.4 provides details of the extent to which the respondents opined that the revenues generated from water projects surpassed the operations and maintenance costs. As demonstrated by the mean (1.81), respondents were of the opinion that the revenues surpassed the costs only to a moderate extent. The results disagree with past indications by Mulwa (2004) who highlighted challenges in operations and maintenance cost coverage as a facet of sustainability.

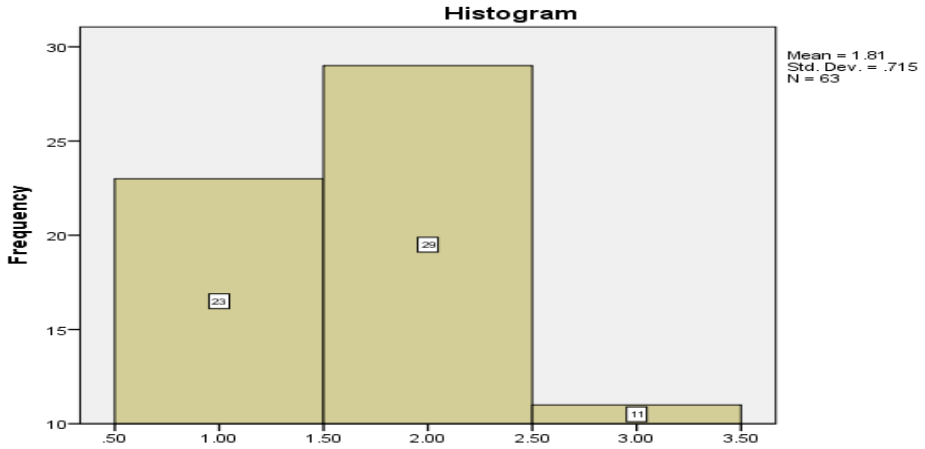

Figure 4.4: Level to which Revenues surpass Operations and Maintenance Costs
Source: Survey data (2018)

4.3 Technical Capacity

Close to three quarters (73.75%) of the respondents agreed that there were competent technical and management staff. The remaining quarter of respondents (26.25%) disagreed on the presence of such personnel. The study indicate that projects conformed to recommendations of past studies such as Ademiluyi and Odugbesan (2008) who roots for involvement of technical and management staff.

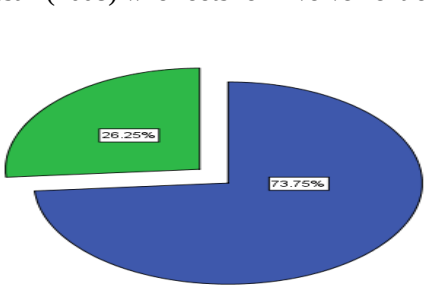

Figure 4.5: Competent Technical and Management Personnel in the Company/ Area
Source: *Survey data (2018)*

Table 4.6: Level of Personnel Skills and Competence

	N	Minimum	Maximum	Mean	Std. Deviation
Personnel has adequate skills and competency to oversee the nature of water and sanitation projects undertaken	59	1.00	3.00	1.6271	.71675
Valid N (listwise)	59				

Source: *Survey data (2018)*

The 59 respondents who agreed on existence of competent technical staff in their organizations or areas opined that the level of the personnel had skills and competence to a moderate extent (mean 1.63, Standard deviation 0.72) to oversee the nature of water and sanitation projects undertaken in the area (s). Thus, suggestions of past studies such as Mengesha *et al.* (2003) were only applied moderately.

4.4 One Way Analysis of Variance (ANOVA)

ANOVA was applied to determine the effect of each project implementation factor on sustainability of water and sanitation projects.

Table 4.7: One Way ANOVA: Technical Capacity and Sustainability of Projects

	Sum of Squares	Df	Mean Square	F	Sig. or P value	Decision
Between Groups	5.9438	4	1.48595	1.922	.001	

Within Groups	75.2753	76	0.99046			P < 0.05 Reject H_0
Total	81.2191	80				

Source: *Survey data (2018)*

The P values for the one way ANOVA between Technical Capacity and Sustainability of Water and Sanitation Projects is 0.001. The P value less than 5% or 0.05 significance thresholds. To that extent, the study concluded that technical capacity has a significant effect on suatainability of water and sanitation projects in Nyeri County, Kenya. The results agree with Ademiluyi and Odugbesan (2008), Mengesha et al. (2003) and Macharia et al. (2015) who also indicated that Technical Capacity influences Sustainability of Projects.

4.5 Multiple Regression Analysis

The multiple regression analysis was applied to determine the effect of project implementation on sustainability of water and sanitation projects.

Table 4.8: Regression Model Coefficients

Model		Unstandardized Coefficients		Standardized Coefficients	T	Sig.
		B	Std. Error	Beta		
1	(Constant)	3.118	.076		1.639	.009
	Technical Capacity	.654	.311	.501	2.573	.001
	Project Funding	1.971	.164	.444	2.830	.021
	Community Participation	.090	.406	.516	2.363	.013
	Government Support	.329	.504	.322	3.902	.036

Source: *Survey data (2018)*

The coefficients for all project implementation variables indicate that the variables significant determinants of Sustainability of Water and Sanitation Projects. The coefficient for Technical Capacity (0.654) has a p-value of 0.001 which is within the 5% level of significance. This demonstrates that Technical Capacity is a useful predictor of Sustainability of Water and Sanitation Projects. The statistics show that a unit improvement in Technical Capacity would lead to a 0.654 unit increase in Sustainability of Water and Sanitation Projects. The results agree with Ademiluyi and Odugbesan (2008), Mengesha et al. (2003) and Macharia et al. (2015) who also indicated that Technical Capacity influences Sustainability of Projects.

The regression Model was posted as follows.

Sustainability of Water and Sanitation Projects = 3.118 + 0.654 (Technical Capacity) + 1.971 (Project Funding) + 0.090 (Community Participation) + 0.329 (Government Support).

5.0 SUMMARY, CONCLUSIONS AND RECOMMENDATIONS

5.1 Summary of Findings of the Study

The study sought to determine the effect of Technical Capacity on Sustainability of Water and Sanitation Projects in Nyeri County, Kenya. Sustainability was indicated through quality of water, hours of supply and coverage of operational and maintenance costs. On Sustainability of Water and Sanitation Projects, analysis results indicated that quality of water supplied by both regulated and unregulated water projects was found to be way below acceptable standards.

The hours of water supply by individual projects was found to satisfactorily above average. Notably, for regulated water projects, the condition of water supply was found to be excellent with some providing water throughout the day. Analysis results further demonstrated a poor coverage of operations and maintenance cost for both regulated and unregulated projects.

Regarding technical capacity as a dimension of water and sanitation project implementation, there was high agreement that the projects had attached competent technical and management staff. However, results indicated that the personnel had only moderate level of skills and competence to oversee the nature of water

and sanitation projects undertaken in the area (s). One Way Analysis of Variance results indicated that technical capacity has a significant effect on sustainability of water and sanitation projects in Nyeri County, Kenya. Regression analysis results indicated that Technical Capacity has a significant, positive effect on Sustainability of Water and Sanitation Projects.

5.2 Conclusion of the Study

On Sustainability of Water and Sanitation Projects, the study concludes that the projects sustainability condition was below acceptable levels. Only hours of supply was seen to meet the acceptable benchmark with poor condition of quality and cost coverage indicated. Notably, regulated projects evidently performed better than those not regulated by WASREB. On Technical Capacity, the study concludes that although projects had technical and management staff attached, their skills and competency base needed enhancement. The constitution of project task teams also required to be addressed. One Way Analysis of Variance results informed a conclusion that technical capacity influences the sustainability of water and sanitation. Further, regression analysis results informed a conclusion that Technical Capacity has a significant, positive effect on Sustainability of Water and Sanitation Projects.

5.3 Recommendations of the study

The study recommends that project management teams device ways to upscale the quality of water supplied and operations and costs coverage which was poor.. On Technical Capacity, the study recommends measures to build up the skills and competence of technical and management staff attached to projects as this was found not to be satisfactory. Technical Capacity, generally, should be enhanced to improve Sustainability of Water and Sanitation Projects

5.4 Suggestions for further research

Contextually, due to a range of research constraints such as limited resources, the study was limited to water and sanitation projects in Nyeri County, Kenya. The study recommends that future studies widen the scope of the study to cover a larger area for more applicability of results. Future studies could also consider diverse projects besides water and sanitation projects. To this regard, the study recommends a study on project implementation and performance of state funded projects in Kenya. Methodologically, future studies could also consider a wide range of indicators for sustainability of projects such as balance sore card indicators, tipple constraints methodology or project diamond approach to measurement of project performance.

The Mediating Role Of Human Resource Capabilities On The Relationship Between Training And Performance Of Parastatals In Kenya

Dr DAVID KIIRU

Email:kiiru.david@ku.ac.ke

ABSTRACT

Worldwide, the public sector plays a central role in any country's socio-economic development. The sector has however been affected by globalization, public sector reforms, regional and international partnerships, climate change, information, communication and technology and human resource development, among other factors. In an increasingly changing global environment, the mandate, structure and operations of public sector must be reshaped and productivity enhanced to make it more focused, efficient and responsive to the needs of those it serves. This research sought to examine the extent to which human resource capabilities mediate on the relationship between training as a strategic human resource management practice and the performance of parastatals in Kenya.

Keywords: ***Human resource capabilities, training, Strategic Human Resource Management (SHRM), parastatals and organizational performance.***

1. Introduction

The knowledge and skills of an organization's workforce have become increasingly important to its performance, competitiveness, and innovation (Lawler, Mohrman, & Ledford, 1998; Martocchio & Baldwin, 1997). Workplace learning and continuous improvement are now considered essential for an

organization to remain competitive (Salas &Cannon-Bowers, 2001). Thus, it is not surprising that employee training is a multi-billion dollar industry worldwide(Haccoun & Saks, 1998).

According to Goldstein (1993), training involves systematic acquisition of skills, rules, concepts or attitudes that result in improved performance in another environment. According to Analoui (2002), for training to be effective those two conditions need to be met first: the criteria of transfer and the strategic nature of training meaning training is effective if it can be transferred to the workplace. Lack or absence of positive transfer means that the individuals are not performing to their potential. This result in them being redundant and failing to advance the objectives of the organization, leading to inefficiency and inability to secure competitiveness. Second training should aim to achieve the overall business strategy. If training is not focused, resources will be underutilized and development will only be for the sake of development rather than realizing the goals of the enterprises.

Training has the unique function in the attainment of firm's objectives by incorporating the welfare of the firm and the employees (Stone, 2002). Currently training is the most important factor in the business world because training increases the efficiency and the effectiveness of both employees and the organization. The employee performance depends on various factors. But the most important factor of employee performance is training. Training is important to enhance the capabilities of employees. The employees who have more on the job experience have better performance because there is an increase in the both skills & competencies because of more on the job experience.

Training also has impact on the return on investment. The organizational performance depends on the employee performance because human resource capital of organization plays an important role in the growth and the organizational performance. So to improve the organizational performance and the employee performance, training is given to the employee of the organization. (Fakhar & Anwar, 2008).

There exists a vital link between the performance of the public service employees and the growth of a nation's economy. This has a significant effect on the activities and growth of businesses and industries that largely support the government and absorb human labour. One of the ways that the government ensures that its employers are kept abreast with global trends, emerging issues and technological change is through capacity building. Ahmed and Hanson (2011) observe that in developing the capacity of public officers, it is crucial to lay emphasis on vital issues of leadership development, that include building the capacity for leaders to instill confidence and motivate workers into a mutual vision to realize organizational objectives.

Capacity development therefore is expected to enhance institutional leadership in Africa to compete in today's rapidly globalizing world and knowledge society, and, to contribute to social capital and social cohesion (Labonte & Laverack, 2001).

Strengthening service delivery is a key strategy for achieving the Kenya Vision 2030 (KV 2030) which is a national development blue-print whose main objective is to provide high quality life to the population in a clean and secure environment by transforming the country into a newly industrializing, middle-income country by 2030 (GoK, 2007). To this end, the Kenya government has implemented key public sector reforms initiatives to create an efficient and more productive public service, with the focus being to transform it into a more pro-active, outward looking and results oriented system (GoK, 2008). The introduction of performance contracting has enabled the government to properly align ministerial and departmental strategic plans in order to improve efficiency and accountability. Many public organizations in Kenya have now adopted employee capacity building as a means of improving the quality, efficiency and speed of public service delivery (UNDP, 2013). The recognition of the employee as the key resource in an organization has also accelerated the need for capacity building (Ahmed & Hanson, 2011).

HR capability can be defined as the routines embedded in the tacit and implicit knowledge of members of an organization functioning to acquire, develop, nurture, deploy, and redeploy human resources in a dynamic, competitive environment (Boxall, 1998). HR capability is a source of competitive advantage as it is embedded in the collective knowledge of firm members that is inimitable, is developed over time, is rare and valuable (Wright, 2004). The RBV of the firm proposes that if an organization utilizes resources that are valuable and rare it gains competitive advantage, which in turn leads to its better performance.

1.1 Value

According to Barney (2002) a capability or resource is valuable if it has the prospect to facilitate a firm to minimize costs and/or react to environmental opportunities and threats. An organization will gain competitive advantage if it is capable of effectively deploying such a resource or capability. Hence an organization's competitive advantage is determined by how valuable its resources and capabilities are. This means that, organizations with capabilities and resources that are marginally valued will at best achieve only minimal competitive advantages. However as argued by Wright (2004), firms that are endowed with great capabilities and resources are likely to attain relatively more competitive advantages. This may mean that the organization has the ability of exploiting its capabilities and resources; because only when valuable

capabilities and resources that have potential are effectively utilized can a firm achieve competitive advantages.

Penrose (1959) argues that the services resulting from resources are a function of the way in which they are utilized. To be able to effectively deploy, or take advantage of a resource, an organization should make use of the appropriate capabilities that means that a firm should have capacity to deploy resources. Hence, whereas a certain resource possibly will have the latent to give rise to a valuable service, that service will remain potential awaiting being utilized through an appropriate means (Amit & Schoemaker 2003).

Resources and capabilities are usually combined simultaneously to help attain competitive advantage. Penrose (1959) further argues that resources or capabilities cannot be of any use by themselves; for them to be efficient they must be used in possible combinations with other resources or capabilities. Makadok (2001) suggests that firms may gain a competitive edge by opting for better resources than competing firms and also by utilizing them more effectively with the right capabilities. Makadok further argues even if the firm's capabilities are great, they might not produce revenue if the firm does not obtain the resources whose productivity would be improved by its capabilities.

Hence despite the fact that a resource or capability might have remarkable latent value, that value can just be realized when it is pooled with an equivalent capability or resource. Given that resources and capabilities are not productive in seclusion the key to attaining a competitive advantage is not just the utilization of a valuable resource or a valuable capability, but rather the utilization of a valuable resource-capability mixture. Furthermore the more valuable the firm's resource-capability combinations, the greater the advantage it will derive as a result of their utilization (Makadok, 2001).

1.2 Rarity

According to Barney (2002) for firms to achieve competitive advantage, they should utilize market opportunity, achieve a cost level and/or counteract a threat that their competitors cannot. However organizations are not likely to attain these results if the resources and capabilities they use are widely held. As an alternative competitive advantage can only be derived from the use of capabilities and resources that are rare, or possessed by a significantly small number of firms in an industry.

Barney (2002) further asserts that for rareness to contribute to competitive advantage there must be a level of resource-capability combinations meaning that resources and capabilities must be utilized in combination, if exploited individually they may not yield rareness. This supports the criterion that exclusivity applies to resource bundles, signifying that if a specific bundle of resources and capabilities is widespread then a large numbers of organizations will be capable of implementing the resulting strategy, thus reducing the advantage to be earned from it by each firm.

Beardwell and Claydon (2007) however argue that organizations must not necessarily have resources and capabilities that are rare in order for them to attain competitive advantage. For instance, if an organization possesses the ability that no other firm does such as a patented chemical process, it is not necessary for it to possess equally rare resources in order to translate that capability's latent value into a competitive advantage. The mere fact that this patented process is intended to influence widely obtainable raw materials such as obviously occurring chemical compounds, the firm may still enjoy a competitive advantage more than its competitors given that its rare capability allows it to exploit common resources differently than other firms.

1.3 Inimitability

According to Beardwell and Claydon (2007) if an organization's human resources add value and are rare, they can provide competitive advantage in the short term, but if other firms can imitate these characteristics, then over time competitive advantage may be lost and replaced with competitive parity. Human Resources should therefore develop and nurture characteristics that cannot be easily imitated by the organization's competitors.

According to Barney and Wright (2008) if a resource itself, or its benefit, can be imitated across firms, then it can only be a source of competitive parity, not competitive advantage. They further recognize the significance of socially complex phenomena, such as an organization's unique history and culture, which can be used to identify unique practices and behaviors which enable organizations to leapfrog their competitors.

According to Cardeal and Antonio (2012) Resources tend to be more difficult to imitate if: they are path dependent; there is an ambiguous relationship between the resources that enhances competitive advantage; they are socially complex, for example, if they are beyond the ability of firms to manage and manipulate them in a systematic way ; there are legal property rights, such as in the case of patents and

if the process of their imitation by other companies is lengthy, for example due to the time needed to train employees or to absorb the knowledge necessary to master the resource.

1.4 Organization

Organizations need to ensure that they are organized so that they can capitalize on, adding value, rarity and inimitability. This implies a focus on horizontal integration, or integrated, coherent systems of HR practices rather than individual practices, that enable employees to reach their potential (Gratton, 1999). This requires organizations to ensure that their policies and practices in the HR functional areas are coordinated and coherent, and not contradictory.

Cardeal and Antonio (2012) argues that competitive advantage stems from the way firms operate and interrelate their strategic and non-strategic resources, exploiting organizational processes, to produce what can be regarded as intermediate products between primary resources and the firm's final products.

2. Research Problem

The empirical literature in this study also highlights that most of these research work examining the relationship between training and an organization's performance have been carried out generally in a few developed countries like United Kingdom and United States (Purcell, 2003; Guest, 2003; Marchington & Wilkinson, 2007; Grant, 2008). According to Katou and Budhwar (2007) it is not clear whether training will work evenly well no matter the background. There is need to fill this gap and to additional look at the existence of such a relationship in other contexts particularly in the African context.

While most empirical literature covered in this study looks at the direct relationship between training and organizational performance, thus gaining support from the contingency perspective, the gap is to show whether HR capabilities have mediating effects on the relation between training and organizational performance. It is against this backdrop of limited empirical research that this study seeks to provide empirical evidence on the mediating role of human resource capabilities on the relationship between training and performance in parastatals in Kenya.

3. Significance of the Study

This study contributes to the transformation of parastatals so that they can completely be involved in the process of economic growth and development. The study also provides some insights and practical

implications to HRM practitioners and line managers about training in Kenya. It helps them cope with innovation needs, for a firms sustained and enhanced growth. This enables firms to keep pace with the rapid environmental changes associated with globalization.

In spite of the assertion that training practices are universally appropriate majority of the research on the relationship training and organizational performance has been carried out in private sector firms, and little is known about this relationship in public sector firms. This study contributes in showing the extent to which values and internal environment in public-sector has considerable implications for how training is practiced in parastatals.

Finally the current study investigates both the mediating role of HR capabilities on the relationship between training and organizational performance. Most of the previous studies show a direct relationship between training and organizational performance.

4. Literature Review

4.1 *Theoretical Review*

This study was underpinned by the resource based view theory. The Resource Based View (RBV) theory is founded on the work of Penrose (1959), others who have extended the theory include, Wernerfelt's (1984), Rumelt (1984), Barney (1996), and Dierickx & Cool (1989). The RBV theory is currently predominantly used by researchers studying SHRM (Wright, Dunford, & Snell, 2001). Barney (1991) posits that an organization gains competitive advantage by not only acquiring but also developing, putting together, and effectively deploying its physical, human, and organizational resources in techniques that put in unique value and that are difficult for competitors to imitate. The resource based view states that competitive advantage comes from the internal resources that are owned by a firm (Wernerfelt, 2004).

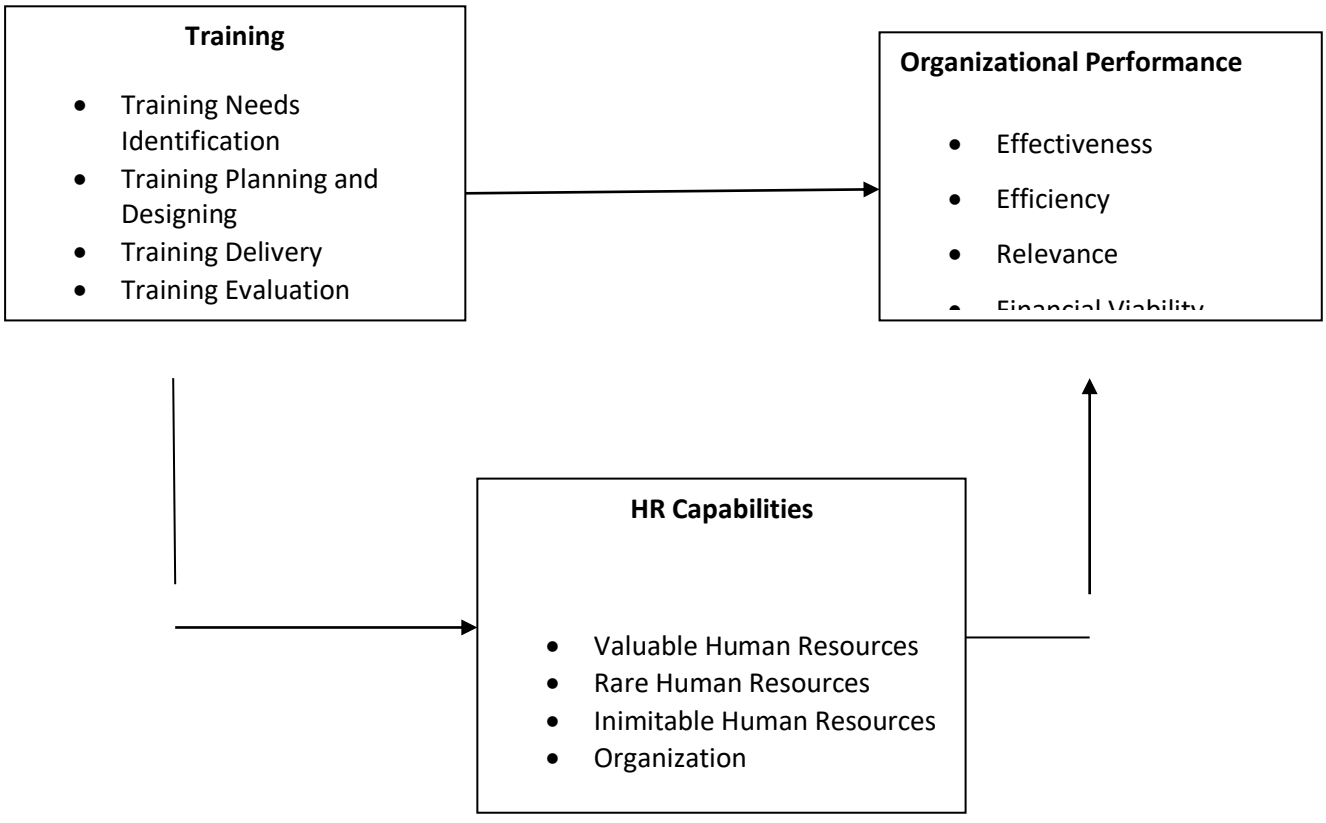
The RBV is concerned with the connection between internal resources, strategy and the performance of the organization. It focuses on the encouragement of sustained competitive advantage through the development of human capital rather than just aligning human resources to current strategic goals (Torrington, 2005). The argument that resources internal to an organization can result to competitive advantage is a shift from earlier suggestions of strategy which focuses on the external environment and such factors as customers, industry, and competitors (Miles & Snow 2004; Porter 2005). The RBV provides a theoretical

enlightenment of how the human resources of an organization can add to performance and competitive advantage.

According to Wright, McMahan, and McWilliams (2004), resources that are valuable, rare, inimitable and non-substitutable lead to competitive advantage. It is the human resources of an organization that make up the resource that leads to competitive advantage. From this outlook HR practices or HR systems possibly will without difficulty be duplicated by other organizations and only the knowledge skills and abilities possessed by individuals within a firm would meet the criterion outlined by Barney (1991).

4.2 *Conceptualization and Hypothesis*

The conceptual model presented in Figure 1 captures the relationships between and among the study variables underpinning training, HR capabilities, and organizational performance.



The conceptual framework illustrated in figure 1 was based on the integration of several organizational theories that explains the relationship between training and organizational performance.

Training which the independent variable of the study is proposed to influence organizational performance. HR capabilities (value, rarity, inimitability and organization) were treated while Organizational performance (effectiveness, efficiency, relevance and financial viability) was the dependent variable.

The following hypotheses which are stated in their null form were tested in this research work:

H_{01} There is no relationship between training and performance of parastatals in Kenya.

H_{02} HR capabilities have no mediating effect on the relationship between training performance of parastatals in Kenya.

5. Methodology

According to Saunders, Lewis and Thornhill (2007) no single design exists in isolation. They argue that combining different designs in one study enables triangulation and increases the validity of the findings. Therefore the current study used a combination of descriptive research design and explanatory research using cross-sectional survey design. Descriptive research design affords the researcher an opportunity to capture a population's characteristic and test hypothesis (Cooper & Schindler 2008). Further, the researcher has no control of the variables in the sense of being able to manipulate them hence guarding against bias. The explanatory research design looks for explanations on the nature of certain relationships and investigates the cause effect relationship between variables (Saunders, 2009). According to Zikmund (2003) surveys provide a quick and accurate means of assessing information if properly conducted. A survey also attempts to quantify social phenomena particularly on issues, conditions or problems that are prevalent in the society.

To ensure that the results of the multiple linear regression analysis were reliable several tests on the basic assumptions about the population from where the data had been derived were conducted.

One of the most important assumption underlying multivariate analyses is the normality of data. Normality refers to the extent to which the distribution of the sample data corresponds to the normal distribution (Hair, 2010). The researcher used the rule of thumb that a variable is reasonably close to normal if its skewness and kurtosis have values between -0.1 and + 0.1 as recommended by Myoung (2008). Normality test is important because regression model estimation methods are based on an assumption of normality since

normally distributed data ensures that the data is fit for further statistical analysis and does not result to inflated statistics and under- estimated standard errors Field (2009).

Linearity means that the relationship between the explanatory variables and the outcome variable is linear. In other words, each increase by one unit in an explanatory variable is associated with a fixed increase in the outcome variable. The Pearson's correlation coefficient was used to test the linearity of the relationship between the variables as recommended by (Yount, 2000; Wooldridge, 2000). Further correlation coefficient shows the strength as well as the direction of the linear relationship; a negative correlation indicates a inverse relationship where an increase in one variable caused a decrease in the other while a positive correlation indicates a direct influence, where an increase in one variable causes an increase in the other variable (Field, 2009).

Multicollinearity refers to the linear correlation among variables. To check for correlated variables, multi-collinearity was tested using variance inflation factor (VIF). A VIF value of above 5 indicates presence of multi-collinearity, and a mean VIF above 2 indicate the presence of multicolliniarity hence should be of concern (Hair *et al.*, 2010). In addition, multi-collinearity was done to enable identification of variables with a high correlation among themselves. Multi-collinearity creates a problem for multiple regression models given that as collinearity increases the standard error of coefficients also increases making them less reliable.

Homoscedasticity refers to the assumption that the dependent variable exhibits similar amounts of variance across the range of values for an independent variable (Hair *et al,*. 2010). To test for the homogeneity of variance the Breush-Pagan test was conducted as recommended by Warner (2008). Where the Breusch-Pagan null hypothesis states that there is constant of error term. Further, Warner (2008) recommends that the probability value should be greater than .05 to meet the homoscedacisticity assumption to allow the regression model for further analysis.

6. Results and discussion

The researcher distributed 370 questionnaires, out of which 268 were received from the field. This represented an overall successful response rate of 72.1%. The rest (27.8%) consisted of those questionnaires that were never returned. According to Wimmer and Dominick (2006), a response rate of 21% – 70% is acceptable for self-administered questionnaires. It guarantees accuracy and minimizes bias. Rogelberg and

Stanton (2007) assert that when cross – sectional studies of survey design are conducted at the individual level, the expected response rate is 50%.

Managers were asked to rate training on a scale of 1 to 5. Where 5 represents 'to a very great extent' and 1 'not at all'. The overall aggregate mean score for this section stands at 4.2276 and the standard deviation at 1.07275. This implies that on average the managers affirmed that training offered was relevant to employees' jobs, and this is aimed at improving organizational performance. This supported the statement suggesting that training is aimed at improving organizational performance with the highest mean score of 4.6978 and a standard deviation of 0.61965. One of the items 'training for problem – solving' scored relatively low, with a mean of 3.6791 and a standard deviation of 1.22765. This may be explained by the fact that employees in parastatals are mostly involved in solving routine problems not complex ones.

The findings are in agreement with the assertion by Katou and Budwar (2007), that there has been a growing recognition of the importance of training as a source of sustained competitive advantage as employers introduce more skills-specific forms of training to deal with skills shortages in certain areas.

4.4.5 Human Resource Capabilities

The respondents were required to rate their level of agreement or disagreement with the statements pertaining to human resource capabilities on a scale of 1 to 5. Where 5 represents 'strongly agree' and 1 'strongly disagree'. The overall aggregate mean score for this section stands at 4.0610 and the standard deviation at 1.02584. This indicates that the parastatals have human resource capabilities that are valuable, rare, inimitable and organized. The aggregated parameters for the sub-variables of human resource capabilities are value with mean score of 4.2174 and a standard deviation of 0.81799, rareness with a mean score of 3.8134 and a standard deviation of 1.00149, inimitability with a mean score of 3.7938 and standard deviation of 1.25968 and organization with a mean score of 4.4195 and a standard deviation of 1.02418. Hence the sub – variable organization and value contribute somewhat highly each to human resource capabilities according to the study measurement scale. Rareness and inimitability make average contribution to human resource capabilities, on the measurement scale.

The findings support the argument by (Wright, 1998; Rangone, 1999) which indicates that one of the key competitive advantages of the organization is its human resources capabilities, which facilitate the production of organizational effectiveness, and high performance of the organization. Thus, any venture in

increasing human resource capabilities ought to be considered crucial to the improvement of the firm's performance.

The first objective sought to investigate the relationship between training and performance of Parastatals in Kenya. A null hypothesis H_{01} was formulated with the assumption that there is no relationship between training and performance of parastatals in Kenya. Table 4.12 shows that the coefficient of training was 0.613. The beta value for training is 0.613. This indicates that a unit increase in training would result in 61.3% increase in organizational performance value in a direct relationship between training and performance of parastatals in Kenya. The t-statistic and corresponding p-value were 9.46 and 0.000 respectively. Therefore, at one percent level of significance the null hypothesis is not supported implying that training has a significant influence on performance of Parastatals in Kenya. On the basis of these statistics, the study concludes that there is significant positive relationship between training and performance of parastatals in Kenya.

The fifth objective sought to determine whether human resource capabilities mediate on the relationship between SHRM practices and performance of Parastatals. To this end, a null hypothesis H_{05} assuming that human resource capabilities had no mediating effect on the relationship between SHRM practices and performance of Parastatals in Kenya was formulated. To test the hypothesis three a composite index of the SHRM practices was computed. To establish the mediation effect Baron and Kenny's causal step approach was used. The first step involved testing the relationship between SHRM practices and organization performance which was found to be statistically significant:

Thus it is observed that the relationship between SHRM practices and organizational performance depends on the HR capabilities. The null hypothesis was therefore not supported and the study concludes that HR capabilities mediate the relationship between SHRM practices and performance of parastatals in Kenya.

7. Summary and Conclusion

Governments owned enterprises are not famous for efficiency. Though no one can be certain of this until the matter has been properly researched, casual observation suggests that most economists probably believe that government enterprises are less efficient than enterprises in the market sector of society. In Kenya the performance of parastatals has been a matter of on-going concern in an environment of scarce resources and increasing needs. Yet parastatals are expected to continue playing an important role in the development

process of the country. If Kenya is to achieve the goals set forth in Vision 2030, a transformational mindset in the way government business is conducted is required.

Training as a SHRM practice was found to be positive and significant in contributing towards organizational performance. Hence HR managers should offer different types of trainings to their staff. Training offered to employees' should also be relevant to their jobs since Kenya's global competitiveness will depend on the ability to create a human resource base that that has the prerequisite skills and knowledge. Lastly HR managers should ensure that their organizations link the training they offer with the company's business strategy.

On human resource capabilities which were found to partially mediate the relationship between SHRM practices and organizational performance, HR managers should recognize the contribution of HR capabilities to organizational success. Identifying the source of competitive advantage with the entire organization and not a single department or leader is the first step toward effective development and utilization of these capabilities. The HR managers should ensure they acquire human resource that is able to exploit environmental opportunities as well as neutralize environmental threats. They should also make sure that the resources used to make their products or services in the firm are rare and patented to make them inimitable.

Abstract

Microfinance institutions in Kenya are currently registered under eight different Acts of Parliament; The Non Governmental Organizations (NGO) Co-ordination Act, the Building ocieties Act, the Trustee Act, the Societies Act, the Co-operative Societies Act, The Companies Act , the Banking Act and the Kenya Post Office Savings Bank (KPOSB) Act. Some of these forms or registrations do not address issues regarding ownership, governance, and accountability. They have also contributed to a large extent to the poor performance and eventual demise of many MFIs because of a lack of appropriate regulatory oversight. This paper aims to identify whether the absence of a regulatory framework has had any effect on the outreach and sustainability of microfinance in Kenya. This paper concludes that that the major challenge hindering outreach and sustainability of micro finance institutions in Kenya is lack of specific legislation and set of egulation to guide the operation of microfinance subsector. Also, the paper creates a platform where further insight can be provided through empirical research .

I. INTRODUCTION

According to Goodhart et al. (1998) The objectives of financial regulation cited in the literature are four-fold, viz.: (1) to protect consumers or investors; (2) to ensure the solvency and financial soundness of financial institutions; (3) to promote fairness, efficiency and transparency in the securities markets; and (4) to promote a stable financial system. the important role played by the financial system dictates that financial institutions need to be regulated for three main reasons, viz: consumer protection, stability of the financial system, and maximizing efficiency

Micro finance constitutes a wide range of practitioners, practices and body of knowledge. Hospes, Musinga and Ong'ayo (2002), observed that two approaches are generally used to categorize the different providers of micro finance services in Kenya. Firstly, they are categorized on the basis of formality where providers are categorized as formal, semi-formal or informal depending of the extent to which the provider is registered and regulated under formal law and transactions are governed under the various statutes of the law of contract or rather by self-regulation or group-based rules. The second categorization is based on the customer/provider relationship in the management and ownership of the financial service-providing entity. Under this categorization, micro finance providers could be dichotomized into client-based micro finance agencies (CMFAs) and member-based microfinance agencies (MMFAs).

Kenya with a projected population of 51.3 Million by 2025 and a per capita income of US $1240 is categorized by the World Bank to be among the poorest countries in the world (WorldBank, 2009).

Muhota (2008) argues that Kenya's development challenge remains in finding sustainable poverty eradication strategies. Micro and small enterprises have been seen as one of the strategies that can bring faster development. Micro finance institutions therefore play a big role in financing the micro and small enterprises for faster development. Micro and finance enterprises are also highly rated for employment creation. They are therefore important in Kenya where unemployment and underemployment are estimated at between 25% and 35% respectively. On this basis, micro finance has played a leading role in Kenya in poverty alleviation. On the other hand, lack of operation regulations in Kenyan micro-finance has resulted to a messy environment with much uncertainty and change (Fisher and Sriram, 2002). Through such disorder, several pyramid schemes have cropped up operating under the banner of MFIs and try to offer financial services to meet the poor population

The regulation and supervision of MFIs however, is a double-edged sword. On the one hand, there are limitations in the ability of public regulatory authorities to provide adequate oversight over MFIs. Innovative players in the industry such as Equity bank that has since transformed into a bank could not have occurred by placing premature and costly regulations on MFI activity. On the other hand, the lack of a regulatory and a supervisory framework can place the microfinance sector in a vulnerable situation. Absence of such a system weakens their credibility as institutions offering deposit protection with the same standards of prudence as other formal financial intermediaries, and could also hamper their ability to raise other forms of capital such as bank borrowings and equity offerings. An appropriate regulatory and supervisory framework would not only overcome reputational challenges MFIs would generally face, it would also strengthen their institutional capacity (Sharif, I et al, 2001)

II. STATEMENT OF THE PROBLEM

Omino (2005), argues that the major challenge hindering outreach and sustainability of microfinance institutions in Kenya has been lack of specific legislation and set of regulations to guide the operations of the microfinance sub-sector (Omino, 2005). Currently, the Deposit-Taking Microfinance bill in Kenya was enacted in parliament. A task force that was established in 2003 had proposed a three-tier framework for the regulation and supervision of MFIs. The first tier would comprise formally constituted MFIs that intend to take intermediate deposits from the general public. The prudential guidelines was meant to empower the Central Bank through the Microfinance Bill to license, regulate, and supervise these institutions in the first tier. The second tier are to comprise formally constituted microfinance organizations that do not take deposits from the general public but accept collateral tied to loan contracts. It is proposed that an umbrella body such as the Association of Microfinance Institutions (AMFI) regulate them. Tier three is to comprise Rotating Savings and Credit Associations (ROSCAs), club pools, and financial service associations regulated by an external agency.

Though efforts have been made by the government, AMFI as well as other players in the industry to prepare MFI institutions for the enactment of the law, there seems to be lack of preparedness by the MFIs in the implementation of the prudential guidelines. Since limited studies have been done to assess whether lack of regulatory framework has been a major hindrance to outreach and sustainability of MFIs as well as studies on preparedness of MFIs to on deposit taking MFIs on the implementation of CBK prudential guidelines, this paper attempted to shade more light in this line. The

purpose of this research was to identify whether the absence of a regulatory framework has had any effect on the outreach and sustainability of microfinance in Kenya.

III. THEORETICAL REVIEW

There are limited theories in financial regulations. Studies of regulation, whether theoretical or empirical, normally fall into three areas: price and entry regulation in industries with competitive market structures, price and entry regulation in monopolistic industries, and (for want of a better term) "qualitative" regulation, which attempts to cope with various kinds of market-failure problems that are only indirectly linked to prices, profits, and market structure.

IV. EMPIRICAL LITERATURE

A. Outreach Challenges and Sustainability

Gaama (2006) observes that the sustainability of over two thirds of MFIs in Africa are far from reach with reason brought forth as having revenues on average as low as 30-40 percent of the actual operating expenses, with transaction costs inflated by high administrative costs and expatriate expenses draining program funds. For lending to be effective, microfinance must reach a wider coverage since majority of the Kenya's poor populace reside in the rural areas. Kathuri (2006), on the other hand noted that the CBK is expected to prudentially regulate the microfinance institutions so that sustainability can be achieved as microfinance institutions will be allowed to widen their sources of funding to include mobilization of savings from the public at a cost that is relatively lower than the prevailing lending rates in the market and be run efficiently

Since outreach is an ultimate goal for micro-finance operations, three approaches can be used to achieve this goal. The first measure for outreach can be through the expansion of the geographical coverage and range of services and/or products offered which could lead to an increase in number of clients and/or

members served though more human, physical and financial resources would be required. Secondly, advocacy and partnership with other organizations working for the same cause can be adopted which is a strategy that does not require an organization to increase its human, financial and physical resources, as it will be leveraging the resources already available in other organizations. Thirdly, microfinance operations may be restructured, such as through merger & acquisition, franchising, linkage with or downscaling of mainstream financial institutions or transformation from NGO to regulated financial institution (Gaama, 2006).

Available data suggest that outreach to micro- and small enterprises (MSEs) has been likewise very limited: the national survey of MSEs in Kenya held by the Central Bureau for Statistics estimated that only 10.4% of the total number of about 1.3 million MSE proprietors have ever received credit from any source (CBS/ICEG/K-REP 1999). Though not specifying what is meant with "important", the baseline survey qualifies NGOs as the most important source of credit for MSEs: the 130 NGOs with credit programmes, together have reached 2.8% (or about 36,000) of the MSEs with their credit services. Given the outreach scores of other types of providers, this is not bad but still very low in absolute terms. Instead of using the qualification "most important", it would be better to speak of the best of the poor performers in this connection. Having said this, the next "popular" source according to the CBS baselines survey, are ROSCAs that have reached 2.5% of the MSEs. The outreach of cooperatives is estimated at a low 1.2%, which is less than half of the outreach of the group of NGOs or ROSCAs, but might be explained by the bias in service provision of cooperatives towards cash-crop farmers. Commercial banks and family and friends take an in-between position, each having reached 1.5% of the MSEs (Hospes et. Al,2002).

The total number of clients reached by MFIs as well as NGO in 1999 was not really impressive, when considering the total population of nearly 30 million people of Kenya and the estimated total of 1.3 million micro and small enterprises. Some argued that this was to do with the limited sources for on-lending to micro finance NGOs from donors. On the other hand, distribution of these MFIs and NGOs is skewed in favor of urban areas, wealthier rural areas and busy rural markets (like Nyeri in central Kenya) connected to main roads, thus leaving a whole spectrum of poor people living in marginal areas with no access to their credit and other financial services(Hospes et. Al, 2002).

Many development NGOs have gained further power by expanding the scope of their financial transactions and taking over various profit-making economic enterprises. Bangladesh is one of the success stories in

micro finance lending, key factor being the partnership with foreign aids and donors. To begin with, large Bangladesh NGOS such as Grameen Bank, BRAC, ASA, and Proshika have received significant financial assistance from the World Bank, the Asian Development Bank, the European Commission, UN International Fund for Agricultural Development, UN Capital Development Fund, UNDP, Unicef, and Unesco (ASA, 2001). In addition, Grameen Bank and BRAC have received funds from the above mentioned bilateral agencies and various private foundations like the Ford, the Rockefeller, and the McArthur (GBSG, 2000).

Additionally, for MFI to achieve high profitability levels requires attention to four key elements: client demand, efficient operations, high portfolio quality and yield on portfolio (USAID, 1999). USAID report continues to add that, Successful microfinance institutions should keep loan losses to about 1.2 to 1.4 percent of ongoing expenses; this must be covered by interest rates. Maintaining a high portfolio quality requires a lot of effort, with immediate follow-up on delinquencies and the ability to track them instantly. An effective management information system (MIS) can be essential. Oji (2005) also found out that if MFIs acquire the necessary technologies, equipment and machinery for their operations they will enhance their productivity; increase their rate of output, competitiveness, and profitability. Consequently, they will repay their loans, expand their operations, employ more resources (including labor) and thereby request for bigger loans.

Most Successful Microfinance have changed their organization culture and gone extra mile in marketing themselves. Kamal (2000) talks of Large NGOs in Bangladesh such as Proshika and BRAC having engaged in directly advocating and lobbying for their respective objectives and policy agendas with the government. The poorer sections of society also use NGOs as an articulate lobby in pursuing their welfare interests. The direct work experience of development NGOs with the poor gives them additional leverage over the government to shape public opinion in favor of their espoused objectives and policies.

Micro finance in Bangladesh have gone an extra mile and played strategic alliances with the government in the strategic plans implementations. Evident of this is the growing recognition of NGOs in the two national development plans, including the Second Five Year Plan (1980-85) and the Third Five Year Plan (1985-90). Many NGOS were increasingly considered as collaborative partners of the government to implement programs undertaken in both the Fourth Five Year Plan (1990-95) during the BNP rule under Khaleda

(1991-96) and the Fifth Five Year Plan (1995-2000) during the Awami League government under Sheikh Hasina (Kabir, 2000).

Credits are the dominant products for most MFIs. Moussa(2007) found out that the major impediment to outreach is the legal requirement for NGOs to have all cheques for loan disbursements signed by the chairman of the board (or a delegate thereof) and the treasurer. As NGOs continue to expand, the volume of transactions will increase significantly, and unless more appropriate procedures are instituted, delays in processing loans will become inordinate. To address this issue, the MFIs asked for a revision of the Executive Regulations of the NGO law to also give an MFI's Executive Director or the Microfinance Activity Manager authority to endorse checks in order to speed the process of loan disbursement.

Many development NGOs have gained further power by expanding the scope of their financial transactions and taking over various profit-making economic enterprises. Bangladesh NGOs are now involved in such business contracts and profit making enterprises. For example, BRAC ventured into printing presses, cold storage, garment manufacturing, retail outlets, and milk products (Daily Star, 1999). Similarly, Grameen Bank and Proshika are now into businesses such as banking, garments, shopping complexes, telephone systems, transport services, cold storage, fisheries projects, fertilizers, deep-tubewells, and biotechnology (GBSG, 2000). Such extensive business ventures undertaken by these NGOs not only make them financially independent of the government, but also enable them to influence government policies in the relevant economic sectors (Islam, 1999)

B. Policies and Regulation

USAID (1999) proceedings found out that, creating an enabling environment for microfinance includes a regulatory framework that allows banks and MFIs to charge interest rates that cover costs. In Uganda, interest rates were liberalized in 1994 and as a result, the microfinance industry has bloomed in recent years. In South Africa, however, the Usury Act has established an interest rate ceiling that has hampered the indigenous microfinance industry. The Usury Act was enacted in South Africa in 1968 with the claimed objective of protecting the poor from being exploited. By capping interest rates, however, the Act had limited credit access for the poor by making it practically impossible for lenders to recover the costs of making micro loans. As a result, the poor have been forced into the informal financial market or into

commercial credit where the retailer can be compensated for real costs, and where the consumers will pay a higher price for credit.

A significant step in the development of the microfinance industry in Kenya was the enactment of the Microfinance Act in December 2006. The introduction was meant to enhance the performance of this sector by putting in place the necessary laws and regulatory framework for the establishment, licensing and supervision of deposit-taking microfinance institutions, focused on providing services and products to low income households and enterprises. The overriding rationale for microfinance regulation and supervision was to create an enabling environment that will promote the performance and sustainability of deposit taking microfinance institutions, while at the same time protecting depositor's interests. The Act envisages two tiers of microfinance institutions, i.e. nationwide microfinance institutions whose minimum core capital is prescribed at Ksh 60 million, and community microfinance institutions with a minimum core capital of Ksh 20 million (CBK, 2007).

Rhyne (2002) in a study in a number of institutions involved were overwhelmingly pleased to be regulated. All report that the benefits of being regulated outweigh the costs. None would even begin to contemplate reverting to their NGO status. This message is highly significant. It means that even when debates over specifics of regulation become heated, the underlying fundamentals are there. The process of becoming regulated has brought microfinance institutions the benefits of; greater access to sources of funds for both equity and debt, especially commercial sources, ability to achieve growth and quantitative outreach goals to serve more people, improved and more professional operations through meeting higher standards of control and reporting, greater ability to offer products beyond microcredit, especially savings and transfers as well as enhanced legitimacy in the financial sector and with clients

An institutional transformation of micro-finance NGOs into a regulated financial institutions (RFI) is embraced as one of the most effective strategies for achieving a significant scale by offering a wider range of services, accessing commercial sources of capital and improving operational efficiency through enhanced systems, controls and transparency in reporting that would result from links to regulators and other banking expertise (Campion and White 1999)

Microfinance today seems to find itself in the midst of a rush to regulate. There is no shortage of people willing to offer views on when and how to do it. But all of them, including the research authors, suffer from

the same handicap: experimentation with microfinance supervision whereas the subject is so recent that we can't rely much on its historical results to guide us. The problems of bank supervisors in poor countries may not sound like a "visionary" place to start. The most carefully conceived regulations will be useless, or worse, if they can't be enforced by effective supervision. If a bank supervisor displays resistance to adding MFIs—mostly small, mostly new, mostly weak on profitability—to her basket of responsibilities, we should recognize that her reasons may be nobler than narrow-mindedness or lack of concern for the poor (Christen and Richard Rosenberg, 1999). In Kenya, like in many other countries, approaches to the regulation of MFIs are complicated by the fact that many institutions are involved in providing microfinance services under different legal structures. This presents a challenge in identifying an appropriate regulatory approach, which is conducive to the development of the sector while providing adequate flexibility to microfinance activities (Omino, 2005).

C. Knowledge and Understanding

The Government of Kenya recognizes that greater access to, and sustainable flow of financial services, particularly credit, to the low-income households and MSEs is critical to poverty alleviation. An appropriate policy, legal and regulatory framework to promote a viable and sustainable system of microfinance in Kenya has been developed via the proposed Deposit Taking Micro Finance Bill. In drafting the Bill, the Government consulted with stakeholders to get their views on the best way to create the required enabling environment for the microfinance sub-sector. In addition, full-fledged microfinance units have been established in the Ministry of Finance (the Treasury) and the Central Bank of Kenya to formulate policies and procedures to address the challenges facing microfinance institutions, especially in the rural areas, and to build a database to facilitate better regulation and monitoring of their operations (Omino, G. 2005)

According to the MFI prudential regulations, Micro-Finance Institutions (MFIs) will always be required to maintain a liquidity ratio of 20 per cent of all their liabilities. On the other hand, MFIs with offices throughout the country will be required to have a capital base of KE60 million while those confined to a community will have KE20 million (Central Bank of Kenya, 2007). On the sale shares owned by the deposit-taking MFI, not more than 10 per cent of the shares will be allowed unless with approval of CBK. One aspect which that is also critical from in proposed regulations is the provision for external auditing of the deposit-taking MFIs. The auditors will be required to communicate any evidence of any noted irregularities or illegal acts by any officer of the institution. On share acquisition, the proposal go forward

by proposing that deposit-taking micro-finance are expected to seek the approval of the Finance minister for any acquisition of more than 25 per cent of their shares(CBK,2007)

Additionally, under the guidelines, deposit-taking MFIs from time to time will be required to make disclosures like those currently provided to banks. Loans will be classified as normal, under watch, sub-standard doubtful and loss depending on the anticipated level of default. The provisions for bad debts attached to the five categories are one per cent, five per cent, twenty five per cent, fifty percent, seventy five percent and one hundred percent. The regulations also forbid MFIs from offering certain financial services such as issuing of third party cheques, operating current accounts, foreign exchange trading, investing in enterprise capital, wholesale or retail trade, underwriting or placement of shares as well as acquisition of land and building except as is necessary for carrying out business.

It is worth noting that staff involved in MFI regulation just like in any other discipline should have professional understanding and experience in microfinance. The set of skills required of staff will change as NGOs transform into regulated financial institutions. Whether the organization chooses to hire additional bankers, re-train its existing staff, or to apply a combination of the two, MFIs need to be aware of the significant amount of time and money required (Campion and White 1999)

Wa Kimotho (2007) argues that full knowledge and understanding of operations and regulation of microfinance banks that fall under central banks, is not a core competence of the Central Bank in any country. Acquiring and gaining such knowledge and understanding is a slow process, takes much effort and it often has a step learning curve. Therefore, systematic, strategic, well co-ordinated and focused capacity building programmes must be put in place, at the earliest time, to close any skill gaps noted and the efforts continue to be maintained to ensure measurable results. Coordinated donor support, understanding and goodwill are essential and key to the success of these programmes. Such programmes would enable all the institutions engaged in microfinance activities, to achieve wide outreach within a minimum period and without sacrificing the portfolio quality. These programmes would, also, enable the CBK staff to regulate and supervise these new institutions with efficiency and confidence.

Microfinance institutions are likely to continue to have owners and managers who do not fit standard expectations. They do not, however, automatically fail the “fit and proper” test, as many bring compensating factors to the table, in terms of specialized knowledge, deep long-term commitment,

reputation risk, etc. This is an area where flexibility is appropriate, and as regulators become more familiar with the microfinance sector, they are likely to become more comfortable making judgments about the suitability of individual players (Rhyne, 2002).

V. FINDINGS

The research utilized descriptive design where a population of micro-finance institutions was asked the same questions in order to eliminate the biasness that could arise from the characteristics of the elements under study. The total sample population comprised 60 micro finance institutions distributed all over Kenya, with most of them having their head offices in Nairobi. Questionnaires were distributed to 33 institutions under the umbrella institution of Association of Micro Finance Institutions (AMFI). 25 respondents were received. The questionnaires were analyzed using descriptive tools and presented using tables and charts.

The study revealed that majority of respondents accounting to 60% of the respondent institutions had been in existence for more 15 years thus should have a higher outreach by now, the research found out that; only 12% of the respondents had a branch distribution in all the 8 provinces, majority accounting to 52% of the respondent institutions had a low clientele level of between 20,001-50,000 clients. While majority of the respondents institutions accounting to 32% had a main goal to alleviate poverty they we still charging higher interest rates and thus were raising funds through transaction fees and interest on loans Limited financial support plays a role in making most MFI unable to meet their objectives.

The study indicates that most respondent institutions accounting to 56% are registered limited companies by guarantee. This finding indicates that most microfinance institutions have no enough funding to enable sustainability and have a wider outreach as expected. It is worth noting that the registration outlined above has played a substantial role in the MFI operation. In terms of ownership, 48% of the respondents believed that the registration had a moderate impact on the operation of MFI. When asked about the role of AMFI and government in regard to the institutions supporting MFI on policy and regulation, most correspondents indicated that the two institutions had done a fair work. On the respondents that indicated that the government and AMFI had done a “good” support, 48% indicated AMFI and 12% indicated government.

Global bodies have done a magnificent role in helping MFI institutions acquire knowledge and skills on current prudential guidelines. This accounted to 48% of the respondents. It is unfortunate to note that

universities, seminars and research bodies have played a minimal or no role in supporting MFI institutions to acquire knowledge and skills in the prudential guidelines. There is need therefore for the research institutions and universities to work hand in hand to support MFIs understand the prudential guidelines. MFI have also done constructive efforts to ensure the knowledge and skills acquired are utilized to produce quality results. 64% of respondents indicated that continuous assessment was an effective tool to impart and asses the acquired knowledge and skills in prudential guidelines. It is inopportune to note that professional exam, internal examination and external audit which could play a bigger role in assessing the quality of knowledge and skills had actually nil respondents.

When asked about the areas the prudential guidelines address the current challenges faced by MFI, all the areas had a high response of "NO" by the respondents. Most respondents believed that the areas outlined on licensing, corporate governance, internal audits, prohibited business, capital adequacy, liquidity management etc were not satisfactorily addressing their challenges. It is also unfortunate to note that some respondents actually indicated " I don't know" on various aspects such as; licensing, capital adequacy, liquidity management and appointment of directors. With such a background, it clearly indicates that some MFI have not taken the guidelines as a critical tool for their sustainability and outreach.

VI. CONCLUSION

The purpose of this research was to identify whether the absence of a regulatory framework has had any effect on the outreach and sustainability of microfinance in Kenya. The following are the major conclusions based on the findings and discussions.

From the study, it can be concluded that, lack of a regulatory framework has been a major hindrance to outreach and sustainability of MFIs in Kenya. Other factors that have played a bigger role in making MFIs not able to attain sustainability are lack of product diversification, poor customer service and organizational culture. Another factor that was found critical is absence of donor funds and soft loans. Such challenges have made MFIs only be able to concentrate on major cities rather than concentrate in rural areas where a majority of the local communities live. Additionally, Microfinance institutions in Kenya are currently registered under different Acts of Parliament, it worth noting that this diverse legislation has had minimal impact on the operation of MFIs. Issues of governance, ownership, MFI image and accountability are still a

challenge to many MFIs. It therefore calls for a standardized regulatory that will apply across all the micro finance institutions in order to streamline the already messy environment.

Most MFIs aren't conversant with the contents of the CBK prudential guidelines. The current tools that are in place to disseminate information on prudential guidelines are not effective. Research bodies and universities which are key in knowledge exploration and imparting have played rear stand on contributing and supporting this crucial sector of the economy. There should be collaboration between MFI management, Universities, Research institutions, AMFI and the government to ensure that the MFIs are taught the need as well as the various aspects of the prudential guidelines.

Through capacity building, MFI should develop collaborations through AMFI which they can relook at their current policy and regulatory environment. They should understand that since the current regulatory environment has played an insignificant role in enhancing their operations, there is need to look at the loopholes in the current regulations and try to harmonize with the prudential on deposit-taking MFI prudential CBK guidelines. There is need also to develop and implement an integrated regulatory environment that will encompass both deposit-taking and non-deposit taking MFI. This was noted especially on non-deposit taking MFI and only a few of the ones interviewed have made progress by accepting deposits. Clear policies should be put in place to carter for both deposit and non-deposit taking MFIs to enable them acquire a competitive edge as well as curb against collapse of such institutions. MFI should increase their client base to ensure outreach and sustainability. Such measures should include use of innovative measures through application of technology to be able to reach the rural areas, improve customer services and aggressively put in place measures that ensure customer retention

Abstract

The aim of this study was to investigate the influence of marketing strategies on the performance of Kenya Airways. A primary research methodology was adopted using questionnaires as instruments of data collection. The case structured questionnaires were distributed to employees, managers and directors of Kenya Airways in Nairobi Headquarters. Using a simple random sampling technique, a sample of 100

respondents were selected to participate in the study. Data collected was coded and entered into Statistical Package for Social Sciences (SPSS). Quantitative results were generated in form of descriptive statistics (frequencies, proportions, and standard deviations) and inferential statistics (regressions). A multiple regression model was used to test the relationship between independent and dependent variables. Further, the regression results included ANOVA and coefficient of variables respectively at 95% confidence level. Results obtained showed that marketing strategies have a positive and significant influence on performance in an organization. It was recommended that that the Kenya Airways management should implement suitable marketing strategies that can attract and maintain customers in order to improve company performance. Future studies should focus on a wider scope and in order to validate the findings from this study.

Key words: ***marketing strategies, performance, Kenya Airways, management.***

Introduction

Background

The ever-increasing competition in modern markets inspire companies to implement various performance improvement strategies. The frequency of poor performance in organizations has increased in the recent past, and unless steps are taken to address it, the severity of decline worsens to the point of financial distress where the firm is unable to satisfy its monetary obligations. One approach of addressing organizational non-performance is implementation of strong turnaround strategies particularly those oriented to marketing activities (Brooks, Weatherson and Wilknson, 2010). To determine if performance is improving or not improving, Brooks *et al.* (2010) recommend that business organizations ought to execute performance measurement. A number of metrics can be used by organizations to measure their performance. Such approaches include but they are not limited to the following; using balanced score cards, using financial forecasts and budgets for financial indicators and variance analysis, and employing strategic metrics as well as operational metrics especially for non-financial indicators among others (Inyange, 2014).

Performance management is a crucial aspect in modern businesses. Its centrality is founded on the observation that it determines the overall growth of an organization. Mutegi (2017a) strongly believes that performance management is usually perceived as the metrics under which an organization's overall growth can be assessed. Companies have a wide array of strategies of improving performance that they can select implement. One of the categories of these strategies is turnaround strategies. Turnaround strategies refer to those efforts and options organizations can explore to improve their performance and ensure that the results obtain depict their anticipations and goals respectively. Managers at various departmental levels such as marketing, human resource management, financial departments, production, and public relations among others are on the run to ensure that the strategic decisions made by entities more importantly at departmental levels are not only supporting the overall goal of an organization, but also improving performance in order to keep up with the pace of competition as well as market trends (Brooks *et al*., 2010). Types of turnaround strategies frequently used in the contemporary business world include competitive strategies, marketing strategies, human resource strategies, and financial strategies. However, most scholars and practitioners give attention to marketing strategies in the endeavours of performance improvement (Dann & Dann, 2011; Dicke, 2016; Charles & Anderson, 2016; Fraser & Hite, 2010).

Marketing strategies include aspects such as diversity marketing, relationship marketing, search engines use, and celebrity endorsement and increasingly becoming common in the modern business environment. Diversity marketing encompasses the adoption of various strategies which are used collectively to build on each other (Rogers, 2011; Hassan, Ullah, Sharif & Mukhtar, 2013). Moreover, relationship marketing was first defined as a form of marketing developed from direct response marketing campaigns which emphasizes customer retention and satisfaction, rather than a focus on sales transactions. Relationship marketing differs from other forms of marketing in that it recognizes the long term value of customer relationships and extends communication beyond intrusive advertising and sales promotional messages. With the growth of the internet and mobile platforms, relationship marketing has continued to evolve as technology opens more collaborative and social communication channels. This includes tools for managing relationships with customers that go beyond demographic and customer service data. Relationship marketing extends to include inbound marketing efforts, (a combination of search optimization and strategic content), PR, social media and application development. A part from relationship marketing, other forms of

marketing strategies that are important in airline industry include search engine optimisation and celebrity endorsement respectively (Inyange, 2014; Hill, 2013).

Problem

The airline industry has been under immense pressure over the past few years with regards to performance. Kenya Airways for instance has recorded losses for the last two consecutive years something which has not gone down well with a number of stakeholders in the industry (Kimotho, 2016). KQ's financial results for the financial year 2015/16 were one of the worst for its historical performances (Aglionby, 2016). The publication cited that the airline reported a net loss of Kshs. 26.2bn ($258m) for 2015-16, up from Kshs. 25.7bn in the previous financial year, as its results were hit by a series of one-off items including charges linked to a poor fuel hedging policy. Empirical studies have indicated that a company's future can be improved by adopting turnaround strategies (Rogers, 2011; Nderu, 2014; Mutegi, 2017b). However, research on how marketing strategies can improve performance of Kenya Airways is still inadequate. Due to existing gaps from previous studies on the impact of marketing strategies on performance, the current study will seek to explore how these strategies have benefited or not benefited Kenya Airways owing to its continued loss making as complained by shareholders and other stakeholders.

Aim

The general objective for this study is to investigate the turnaround strategies and performance in Kenya Airways.

Objectives

To investigate the influence of marketing strategies on performance of Kenya Airways.

Significance

The study will be of great importance to various stakeholders such as the management of Kenya Airways, the employees in Kenya Airways, the Government of Kenya and other shareholders, and the academicians respectively. The management of Kenya Airways will be able to benefit from this research because they will be able to understand the specific marketing strategies that they can implement to improve performance of the organization.

Literature Review

Theoretical Review

This study was anchored on the marketing theory. Marketing is a broad field with a number of models or theories that can be grouped together to explain the basic concepts behind marketing. The theory of marketing is founded on the premises of the philosophies that firms or companies utilize in turning around their performance strategies (Hunt, 2015). The philosophies are commonly referred to as the P's of marketing and they include product, price, promotion and price among others (Palmer, 2012). These philosophies are collectively referred to as marketing mix. A part from the marketing mix, marketing theory involves other strategies such as; channel marketing and viral marketing respectively (Dann and Dann, 2011). All these strategies are important because they collectively shape marketing theory and firms can utilize them in enhancing performance irrespective of the industry in which they belong, as opposed to those theories such as mass marketing that are industry specific depending on the nature of products and services being offered.

Firstly, the marketing mix strategy encourages organizations to consider factors that can directly or indirectly influence their business (Charles and Anderson, 2016). For example, it is important for a company to consider price in reference to their competitors as to whether it is reasonable, affordable and competitive. Secondly, place in which services and marketing efforts are carried out should be strategic in the sense that sales can be closed (Palmer, 2012). Using promotion serves to attract customers both existing and potential ones in order to achieve revenues targets. Additionally, the nature of product or service

offered to the market should be of high-quality in order to be able to satisfy customer needs (Charles and Anderson, 2016).

Secondly, "a basic marketing theory states that to maximize sales, a company must position its products or services in the marketplace in such a way that consumers believe they need a particular product for service or that a product or service they need has a particular benefit" (Dicke, 2016). This concept can be explained adequately using the channel marketing concept in the sense that where an organization such as KQ markets its services should be strategic with potential customer leads. Thirdly, the concept of viral marketing is based on a recent development in marketing theory and centers around the effects of technology on marketing products (Charles and Anderson, 2016). It involves the use of social marketing as a way of communicating in marketing using platforms such as emails, Twitter accounts, Facebook pages, and any other electronic or internet enabled platforms to reach customers.

Generally, the theory of marketing is important to this study since the main focus is to identify turnaround strategies that Kenya Airways can use to ensure that they improve performance that has been for a long time of a greater concern and worry to different stakeholders. For example, they can position their marketing strategies, charge reasonable prices as opposed to charging expensive tickets as already revealed in background of study, identify the specific areas they can target (place) in order to realize profits, and promote their services to target market respectively (Dicke, 2016). Further, the company can adopt both viral marketing and channel marketing concepts to improve their marketing activities. In this regard, the theories or philosophies in marketing are relevant to objectives such as marketing and competitive strategies. Therefore, the theory supports the variable of marketing strategies and it is relevant to the current study as it offers a foundation for investigating the approaches currently used by KQ.

Empirical Review

Financial strategies in organizational performance are considered as one of the key strategic approaches that can be utilized to help an organization turnaround its performance (Rhyne, 2013). It is important however, to appreciate the fact that they cannot be pursued in isolation if effective results must be achieved. Strategy implementation involves organization of the firm's resources and motivation of the staff to achieve objectives (Muchira, 2013). Primarily, these assertions complicate management and implementation of financial strategies owing to the nature in which there is an overall intertwining of the organizational approaches. In a more simplistic manner, Rhyne (2013) states that financial strategies cannot be relied upon in isolation. On the other hand, Muchira (2013) also states that implementation of any strategy involves both personnel and financial resources. In this case, it is evident that the main assumption from this statements is that implementation of any strategy in an organization must have an element of financial resources.

Similarly, a study was carried out by Namada, Aosa, Awino and Wainaina (2014) on "management participation and firm performance". Although the study was founded on the premise of management as an overall area of concern, it came out clear from the study's findings that organizational participation is very critical in ensuring that results are achieve. Namada and his colleagues clearly demonstrate that while considering different strategies for performance improvement, there is an integration of all departments in an organization from a management perspective. However, the most critical of all the departments is the financial department. It is important to acknowledge the fact that as all other strategies are pursued by incorporating financial section, the overall assumption is that they are all considered financial strategy in nature in one way or the other although not in a direct manner.

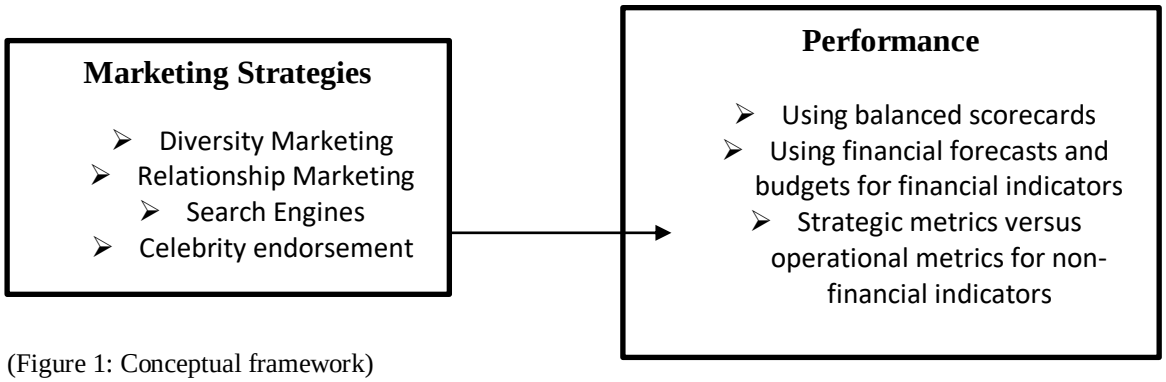
Firm performance is basically a strategic planning function, while financial planning is one of the main strategic decisions in an organization. Arasa and Obonyo (2012) explored a qualitative research in identifying the "relationship between strategic planning and firm performance". They observed that strategic planning encompasses a number of decisions key of which is financial resources allocation and distribution, as well as fundraising. Critically, this relationship demonstrates that for all other strategic decisions to be implemented there is an inevitable element of budgeting, in which case an organization must satisfy the measures to be taken to raise sufficient funds and how these funds should be allocated among competing needs in an organization.

Although not trying to present financial strategies as superior to other strategies, it is important to impact and role financial decisions have in the overall organizational performance. Isaksson and Lantz (2015) too

share the same sentiments in their publication on "outsourcing strategies and their impact on financial performance". The authors, who had initially targeted to investigate outsourcing effectiveness in small organizations, ended up drawing an important line of literature that can be used in this study. Precisely, they noted that outsourcing in any manner is a move towards helping an organization utilizes its resources from a financial perspective. For instance, by outsourcing, a firm is able to minimize costs as opposed to having full time commitment. This can be linked to leasing from out assets and aircrafts in the case of airline industry. However, organizations must be strategic in identifying areas that can be outsourced and those that should not while focusing on maximization of returns from a financial perspective.

Waweru and Ngugi (2014) investigated the influence of "financial management practices on the performance of small and micro enterprises in Kenya". In their study, they observed that knowledge on financial management is one of the strategies to help entities improve performance hence promoting economic growth in an economy. An exploratory study by Capon and Farley (2014) also contributed that strategic planning helps firms to ensure that financial decisions are made in a manner that help firm maximize their returns. In overall, the two studies have shown that financial strategies cannot be overlooked as they are as important as any other strategies, but more importantly very critical in determining general performance.

Conceptual Framework



(Figure 1: Conceptual framework)

Methodology

Descriptive design is suitable is it enables the researcher to answer questions such as how, what, when, which, where, who among others (Creswell, 2014).

For this research, the target population comprised directors, senior management, head of departments and staff/employees of Kenya Airways in Nairobi headquarters distributed across various groups as presented in table 3.1 below.

Table: 1 Target Population

Level	*Number*	*Percentage of target population*
Directors	10	2.50
Senior Management	20	5.00
Head of Departments	30	7.50
Employees	340	85.00
Total	400	100.00

The researcher employed a sampling formula as proposed by Kothari (2014) to select a sample size which is represented in the sampling frame table 2 below.

$n=N/1+N(e)^2$……(i)

Where;

N = Population Size, n = sample size, and e = is the level of precision which is 0.05 in this case for a 95% confidence level. Because of time and financial constraints, the above formulae will be adjusted by dividing it by 2 based on the researcher's judgement, provided the overall sample size will be above 20% as recommended by Kothari (2014).

Hence; the sample size will be given by; N = 400, e = 0.05

Calculated as; $\{400 / [1+400(0.05)^2]\}/ 2$

$= 100$

Sample size of 100 respondents is 25% of the target population distributed in different groups as in the sampling frame table 3.2 below.

Table 2: Sampling Frame

Level	Initial population size	Calculated Sample Size using 25%
Directors	10	2
Senior Management	20	5
Head of Departments	30	8
Supervisors	340	85
Total	400	100

Structured questionnaire containing both closed ended and open ended questions were used to collect data. Majority of the questions were closed-ended so as to encourage the respondents to give feedback as because it required them to tick from among the provided options. The researcher then administered the questionnaires with the interview questions face to face and allow the respondents to fill in their responses after seeking permission from the entity's management. The questions were classified into sections with regard to background information and the four objectives envisaged in this research.

Reliability was determined based on internal reliability which is basically on the internal consistency of the constructs or items used and this will be measured by the use of Cronbach's Alpha test (alpha value should be at least 0.7). The researcher ensured the questionnaires met the requirements of content validity. This involved basically examining the content of data collection instruments to establish if they are valid.

Data collected using questionnaires was cleaned, organized, sorted and analyzed using Statistical Package for Social Sciences (SPSS) and the results will subsequently be presented using tables and figures respectively. The to be obtained will be used to present the entire interpretation in a regression model that will show the relationship of the dependent variable with independent variables in an equation as presented below;

$$Y = B_O + B_2X_2 + e$$

Where:

Y = Dependent Variable; B_0 = a constant coefficient (if any); B_2 = Coefficient of marketing strategies; X_2 = Marketing strategies; e = is an error time respectively.

The researcher ensured confidentiality of personal information of the respondents that may take part in the study. The researcher also ensured informed consent and data safety during the whole process of data collection, analysis and interpretation.

Findings

Response rate and Reliability

This section presents findings from the study that achieved a 92% response rate. The questionnaire items regarding marketing strategies was 0.747 as shown in table 3 below.

Table 3: Cronbach's Alpha Test for Independent Variables

Independent Variables	Number of items	Cronbach's Alpha
Marketing Strategies	17	0.747

The table above shows the Cronbach's Alpha value for the variable marketing strategies is 0.747, which are sufficient to conclude that there is data reliability since are above the recommended value of 0.7.

Demographic Characteristics

The study analysed demographic characteristics of the respondents and presented findings using table 4 below.

Table 4: Demographic characteristics

	Variable	**Characteristic**	**Frequency**	**Proportion**
1	Age	Below 20 years	20	21.7%
		21 - 30 years	21	22.8%
		31 - 40 years	14	15.2%
		41 - 50 years	22	23.9%
		Above 51 years	15	16.3%
		Total	92	100.0%
2	Gender	Male	49	53.3%
		Female	43	46.7%
		Total	92	100.0%
3	Level of education	Diploma	21	22.8%
		Bachelors	29	31.5%
		Masters	21	22.8%
		PhD	21	22.8%
		Total	92	100.0%
4	Department	Director	4	4.3%
		Senior manager	15	16.3%
		Head of department	20	21.7%
		Junior employee	53	57.6%
		Total	92	100.0%
		Below 1 year	6	6.6%
		Between 1 - 2 years	17	18.7%
		Between 3 - 4 years	15	16.5%
		Between 5 - 6 years	12	13.2%
		Between 7 - 8 years	13	14.3%
		Between 9 - 10 years	11	12.1%
		Above 11 years	17	18.7%
		Total	91	100.0%

Majority of the respondents were males (53.3%) aged 41-50 years (23.9%) with an undergraduate degree (31.5%), working as junior employees (57.6%) and having worked with Kenya Airways for a period of 1-3 years.

Marketing strategies influence on Performance of Kenya Airways

The objective of this study was to investigate the influence of marketing strategies on performance of Kenya Airways. The respondents were subjected to a series of questions that were meant to determine their opinions on marketing strategies. The responses obtained have been analysed and presented in the sections that follow.

The respondents were asked to indicate the extent to which they agree with the given set of statements related to marketing strategies. They were required to indicate if they strongly disagree, disagree, neutral, agree or strongly agree.

Table 5: Extent to Agreement of Statements on Marketing Strategies

Statements	Strongly Disagree (%)	Disagree (%)	Neutral (%)	Agree (%)	Strongly Agree (%)	Mean
KQ focuses on customer satisfaction in all its services	5.4	5.4	4.3	42.4	42.4	4.11
No need to advertise since KQ is a big firm	1.1	1.1	7.6	44.6	45.7	4.33
Marketing can help KQ to turnaround poor performance	5.4	5.4	4.3	44.6	40.2	4.09
Marketing employed not strategic in the market	2.2	4.3	4.3	60.9	28.3	4.09

Source: (Survey Data, 2018)

Hassan et al. (2013), in their study reputed that marketing strategies are paramount turnaround strategies that any organization should embrace. The study findings revealed the respondents applauded the focus on customer satisfaction, n need to advertise since KQ was a big firm, marketing can help KQ to turnaround poor performance and marketing employed not strategic in the market since they had an average of above 4 as shown in the table 4.12 above. The findings contradict a study by Jaakkola (2011) who established that there was need for advertisement and strategic marketing despite the size of the firm. Moreover, the percentages of the four statements imply that the respondents were satisfied with marketing strategies embraced by the Kenya Airways.

The respondents were asked to express their opinions on whether the marketing strategy was an effective strategy to help an organization turnaround its performance.

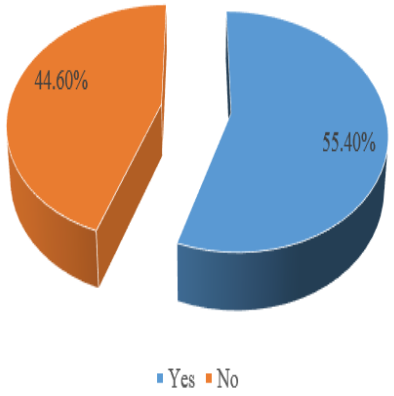


Figure 2: Marketing is an Effective Turnaround Strategy

The responses indicated that 55.4% of the respondents said yes while 44.6% said no as shown in the figure 4.5 above. The findings implied that marketing dimension of any company influenced its turnover. According to Ogbu (2016), effective marketing strategies resulted to a huge market share, increased number of customers and boosted reputation of the firm thus boosting sales revenue and improved performance of the firm. Additionally, the findings were echoed by Lucio and Noci (2010) who found out that marketing had great impact on the turnaround strategies and the performance of the firm.

The findings of the study on the extent to which marketing as an effective strategy to help an organization turnaround its performance indicated that 38% of the respondents said it was small extent, 37% said it was a large extent and finally 25% of the respondents said it was moderate extent as shown in the figure 4.6 below.

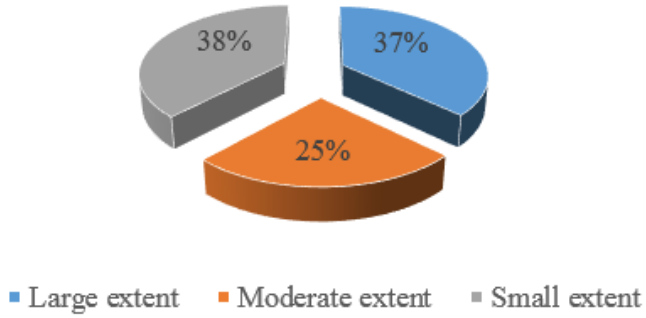

Figure 3: Extent of Marketing as a Turnaround Strategy

The respondents were asked their opinions on which marketing strategies they thought were important to Kenya Airways.

Table 6: Marketing Strategy Important To Kenya Airways

Important	Frequency	Percentage
Diversity marketing	19	20.7%
Transactional marketing	17	18.5%
Social media marketing	16	17.4%

Celebrity endorsement	12	13.0%
Relationship marketing	14	15.2%
Others	14	15.2%
Total	92	100.0%

Source: (Survey Data, 2018)

The responses obtained revealed that 20.7% of the respondents believed diversity marketing was the most important, 18.5% agitated for transactional marketing, 17.4% proposed the social media marketing, the respondents who chose relationship marketing and other marketing strategies were represented by 15.2% each. Also, the respondents who were for celebrity endorsement were represented by 13% as displayed in the table 4.183 above. The findings agree with the study by Russow and Okoroafo (2013) who enumerated transactional marketing, social media marketing, celebrity endorsement and relationship marketing as the most important marketing strategies to boost performance of a firm. They further argued that the strategies were essential turnaround strategies to transform poor performance of any firm.

Relationship between marketing strategies and performance of Kenya Airways

The regression analysis found an R-square of 0.696 (R^2=0.696) as shown in table 7 below.

Table 7: Model summary

R	R Square	Adjusted R Square	Std. Error of the Estimate
.392[a]	.696	.657	.57249

This implies that the independent variable (marketing strategies) explain about 69.6% of the changes in the dependent variable (performance) when all other factors are held constant. Further, a value of 0.657 implies 65.7% of the changes in the dependent variable are explained by the independent variables ceteris paribus when adjusted for the degrees of freedom.

Analysis of variance revealed that the model was significant in predicting the relationship between the independent and dependent variables due to its p-value of 0.005 ($p<0.05$).

Table 8: The ANOVA Table

Model	Sum of Squares	Df	Mean Square	F	Sig.
Regression	5.171	4	1.293	3.945	.005
Residual	28.514	87	.328		
Total	33.685	91			

The coefficient of marketing strategies was found to be 0.454 with a significant level of 0.00 as shown in table 9 below.

Table 9: A Table for Regression Coefficients

Model	B	Std. Error	Beta	t	Sig.
(Constant)	3.755	.428		8.772	.000
Marketing strategies	.454	.120	.534	3.778	.000

The complete regression model is given by the equation below;

$Y = 3.755 + 0.454\ X_3 + 0.57249$…….(ii)

At 95% significance level, the marketing strategies are found to have a significant positive relationship with the performance of a firm (Fraser and Hite, 2010). The sig. value 0.000 which is less than alpha value of 0.05. This indicates that a unit increase in marketing strategies leads to 0.454 increase in the level of performance of Kenya Airways.

Conclusions

This study aimed at investigating the effect of marketing strategies on the performance of Kenya Airways, owing to its failed expansion strategy. Findings from the study revealed that Kenya Airways did not focus on customer satisfaction in all its services. Failure to focus on customer satisfaction is against the basic marketing theory that states to maximize sales, a company must position its products or services in the market place in such a way that consumers believe they need a particular product for service or that a product or service they need has a particular benefit. It was also noted that the management saw the need to advertise despite Kenya Airways being a big firm hence boosting the public image and reputation. The design of the marketing strategy highly influenced the performance as turnaround strategy. In addition, marketing strategy was regarded as an effective strategy to help an organization turnaround its performance. The respondents enumerated diversity marketing, transactional marketing, social media marketing, relationship marketing and celebrity endorsement as the main elements of marketing most important to Kenya Airways in its turnaround strategies and improvement of performance. Further, the findings of the study established that there is a positive and significant relationship between the marketing strategies and the performance of a firm.

The study results were used to conclude that marketing strategies are key in improving the performance of Kenya Airways. Marketing should entail creativity while designing the strategies and be implemented fully to enhance performance. Also, it was concluded that customer satisfaction on all its services were key to improvement of its performance. Proper marketing strategies would boost the public image and the reputation of the Kenya Airways. This would in turn through multiplier effects draw more customers to Kenya Airways boosting its revenue base. Further, it was concluded that the marketing strategies are effective turnaround strategy for any organization. The study concluded that diversity marketing, transactional marketing, social media marketing, relationship marketing and the celebrity endorsement were the key elements associated with marketing strategies applicable to Kenya Airways. In addition, it was concluded that there exists a positive linear relationship between marketing strategies and the performance of Kenya Airways. This implied that transformed and efficient marketing strategies translated to better turnaround strategies and improved performance for Kenya Airways.

The study recommends that customer satisfaction in all services of Kenya Airways be implemented. Satisfied customers will be help in marketing Kenya Airways to potential customers hence boosting its reputation and image. Meeting customer needs is recommended as the first goal of Kenya Airways in its turnaround strategy. Based on the findings of the study, it is recommended that diversity marketing, transactional marketing, social media marketing, relationship marketing and celebrity endorsement to be implemented by Kenya Airways as part of marketing strategies. Moreover, the research recommended proper designing and package of the marketing strategies and ensure they are implemented fully. Marketing strategies were recommended to be enhanced in all operations of Kenya Airways to improve its performance.

One of the limitations of this study is that it focused only on turnaround strategies in relation to performance. Future research may consider to investigate the management of funds and extent of corruption

in Kenya Airways. This is due to the fact the government of Kenya has been bailing out the airline regularly yet it continues to report huge losses and deteriorated performance. Moreover, from the findings of the research, it has been established that the respondents cannot tell whether the emerging airlines for local transport are threats to the performance of Kenya Airways. Therefore, studies should be carried out to investigate the effect of emerging airlines for local transport on the performance of Kenya Airways.

Strategic Human Resource Management Practices On Performance In Selected Public Universities In Kenya

Doris Naitore

Abstract

Strategic Human Resource Management (SHRM) is one of the aspects that is attributed to organizational competitiveness both from developed to developing countries. Despite the fact that SHRM influences organizational performance, it is revealed from human resource literature that public organizations and more specifically Public Universities in Kenya are experiencing deteriorating performance due issues associated to failure to adopt SHRM policies. High turnovers, periodical strikes and boycotts, service inconsistencies among Public Universities are issues associated to poor human resource management strategies. Based on this premise, this study sought to investigate the effect of Strategic Human Resource Management on performance of selected Public Universities in Kenya. The objectives of the study were: to establish that influence of human resource planning, staffing and retention, training and development on performance of selected Public Universities in Kenya. The study adopted descriptive research design. The target population of the study comprised of 13 Public Universities in Kenya where 914 employees were selected from teaching and non-teaching staff members. Simple random sampling technique was used to select the respondents of the. To determine the sample size, the scientific formula proposed by Israel was used to arrive at a sample size of 278 employees. Pilot study was conducted on 5 respondents to determine validity of the instrument by using views of scholars, university lecturers and industry experts while reliability of the instrument was determined by using Cronbach Alpha coefficients of 0.7. Primary data was collected using a structured questionnaire consisting of close-ended and open-ended questions. In addition, secondary data was collected from published sources such as Labour Acts, reports by Commission for University Education (CUE) and performance appraisal reports. Qualitative data was analyzed using content analysis method where key themes of public and spoken word was critically analyzed and conclusions were made. Quantitative data was analyzed using descriptively and inferential statistics such as regression with the help of Statistical Packages for Social Sciences (Version 24) software. Regression analysis was conducted at 95% confidence level and 5% significance level. Descriptive data was presented in form of tables and figures. The study revealed that there exists a positive significant relationship between human resource planning ($r = 774$, $p < 0.000$), staffing and retention ($r = 376$, $p < 0.000$), training and development ($r = 576$, $p < 0.000$) on performance of selected Public Universities in Kenya. The study concludes that despite the fact that strategic human resource practices had a significant positive relationship on performance of selected Public Universities in Kenya, issues of understaffing, motivation and capacity development were of great concern. Therefore, this study recommends that for effective performance of Public Universities in Kenya, the government should increase financial budgets to facilitate adoption of appropriate technology, employment of staff and investment in infrastructural facilities.

CHAPTER ONE

INTRODUCTION

1.1 Background of the Study

Organizations operating in the 21st century are gradually shifting from traditional approaches of Human Resource Managemement (HRM) to Strategic Human Resource Management (SHRM) approaches (Lamba & Choudhary, 2013). With the changing business environment, competition, influence of technology, employee diversity, change of consumer demands and costs of operation, organizations in developed and developing countries have to adopt human resource management in order to be competitive (Thite & Russell, 2010). The development of SHRM concept since 1980s has resulted to transformation in many organizations internationally and locally and internationally (Abdus, 2011). The concept of SHRM is widely recognized around the world and particularly in developed countries like Australia, United States, Japan and Korea.

Organizational performance is thought to be a function of Strategic Human Resource Management practices even though there is no clear link between SHRM practices and organizational performance (Yamamoto, 2011). However, organizational performance is defined as the ability of the organization to get its best out of the efforts employees if effectively managed. Enhancing organizational performance in terms of customer service quality, improved image, repeat purchase, change implementation, increased employee morale, new product development and adoption of new technologies is conceptualized to be an uphill task if employees are not considered to be valuable asset (Wright, Kroll & Lado, 2010).

A survey Adnan and Izzat (2012) in Israel demonstrates that SHRM management is one of the fundamental practices that has contributed to significant improvement of organizational productivity. Swapna and Raja (2012) in India observed that companies operating in developing countries are gradually recognizing the SHRM concept as the competitive practice of organizational performance despite the internal and external challenges that are experienced. Ali and Nur (2016) observed that oil companies in Iraq were in a position to survive in highly competitive environment because of strategic human resource planning and talent management.

Masaiti (2011) in Zambia observed that many organizations operating in developed and developing countries are striving to adopt human resource strategies in order to address issues related with consumer demands, production costs, employee job satisfaction and workplace technology. Gopal (2012) in India noted that Strategic Human Resource Management is one of the fundamental practices of competitive firms. Organizations that fail to develop

ISBN 978-9966-132-53-6 @ Copy Right .2019

human resource strategies are likely to perform poorly and vice versa. Hassan (2014) in Pakistan observed that for organizations to achieve their objective more efficiently and effectively, Strategic Human Resource Management policies should be developed. For organizations to achieve their long term and short term goals in the changing business environment, shaping employee behaviours through human resource policies or strategies is key.

Extensive studies conducted in Kenya by Kiiru (2013); Kilika et al. (2016); Gitonga, Kilika, & Obere (2016); Thiriku & Were (2016) indicate that Strategic Human Resource Management can result to a number of benefits to modern organizations that range from: the ability of the organization to achieve its goals with minimal resistance, employee support of business strategies, it enhances organizational competitiveness, it promotes creativity and innovation among workers, it promotes top management support of plans formulated and enhances cooperation among workers and departmental synergies. They further revealed. Ligare, (2010) and Ngatia (2011) contend that for any organization to be competitive, issues of human resource planning, talent development, job design, knowledge and management, learning and development, employee staffing and retention and training and development should be addressed.

1.1.1 Strategic Human Resources Management Practices

Strategic Human Resource Management concept has continued to evolve as scholars seek a common consensus on its operationalization in the organizational context (Masaiti & Naluyele, 2011). Despite a common consensus on the universality of SHRM, a number of scholars have tried to it from different perspectives. Wright et al. (2010) define a strategy as the direction and scope of an enterprise in the long term period. Williams (2003) defines strategy as the means which firms use meet their objectives in the changing business environment. On the other hand, strategy it regarded as overall plan which define the purpose and direction of an enterprise. Wangai (2014) asserts that strategies formulated by an organization can range from marketing, procurement, finance and human resource.

Samson et al. (2016) attest that SHRM practices are decisions that have a long term impact on functional areas of a business enterprise. In the dynamic business environment, organizations are embracing strategic moves that seek to maximize productivity using human capital. In any competitive organizations, strategic human resources management is a function that is unseparatable from other core-functions of the firm. Without effect human resource strategies such as recruitment, training, compensation and performance appraisal, organizational competitiveness cannot be achieved (Dimba, 2010).

Kiiru (2013) contends that Strategic Human Resource Management is a practice that involves the use of integrated methods aimed at development human resource plans. By extension, these strategies describe intents and plans

associated to the overall organizational considerations, employee resourcing, knowledge and development, reward and employee relations are some of the Strategic HRM that can enhance organizational competitiveness. Strategic Human Resource Management is observed to be a continuous activity that requires constant adjustment of top management, the business environment and organization resources (Yamamoto, 2011). Kilika et al. (2016) assert that SHRM as policies that are developed and implemented by employees of the organization. It is an approach that emphasizes on equipping employees with necessary skills and knowledge to enable them adjust to internal and external challenges.

Armstrong (2010) regards SHRM to be a process that enables the development of a human capital in the organization. He further argues that, human resource strategies have remained the integral part of any competitive business enterprise. Thiriku and Were (2016) assert that SHRM entails establishing policies and techniques that enable skillful strategy implementation using dedicated teams to influence cross-functional knowledge and competences, increasing knowledge management abilities that support the leveraging of best practices and efficient use of opportunities (Loderer & Martin, 2007).

Kasmi (2011) argues that traditional HR emphasize on manual skills that concentrate on training employees on exact duties and responsibilities. Further, it focuses on individuals' capacity to perform a specific task without positive consideration of changing trends in the corporate world. The traditional HR approach is viewed to mechanical and rigid to changes but SHRM is considered to be organic that is adaptable to changing trends in the business environment (Greenidge et al., 2012).

1.1.2 Organization Performance

Strategic Human Resource Management is considered to be a function of organizational performance of any competitive enterprise from context to context if effectively managed. With increased competition, change of technology and consumer need for quality goods and services, organizations are embarking on SHRM as a driver of organizational competitiveness (Voorde, Van De, Paauwe& Van Veldhoven, 2010).

The concept of organizational performance has continued to receive a number of interpretations from different scholars. For instance, Shikha and Karishma (2012) regard organization performance to be employee satisfaction, customer satisfaction, minimal employee absenteeism and high level of employee commitment. On the other hand, Ghazala and Habib (2012) define organization performance as the extent to which a firm can achieve its objectives using limited resources. Thiriku and Were (2016) also suggest that organization performance can be evaluated using profits, volume of sales and employee satisfaction.

Lusch and Laczniak (2009) ascertain that organizational performance is the extent to which an organization can achieve the intended objectives within a given period of time. Organizational performance can be measured using employee commitment, exceeding customer expectations, maximizing revenue and minimizing general costs of operation. Abdullah (2014) asserts that HRM performance outcomes can be categorized into: HR-related outcomes which is characterized with employee turnover, absenteeism, job satisfaction and commitment; Organizational outcomes which are characterized with aspects of productivity, quality, customer service, costs of production and customer satisfaction.

Organizational performance is thought to be a function of Strategic Human Resource Management in competitive organizations (Ligare, 2010). Even though human resource management practice is thought to influence organizational performance, Strategic Human Resource Management is also thought to be one of the practices that enhances organizational performance in a more efficient and effective way (Lanyon &Abdalla, 2008). Even though there are conflicting views on the extent to which strategic management practices chosen by organizations influences performance of organization, to a larger extent, SHRM is seen to be considered to be the most appropriate practice of surviving in the changing business environment that is characterized by stiff competition, employee diversity, influence of technology and globalization (Masaiti & Naluyele, 2011).

Measurement of organizational performance is viewed to be a complex issue that is attributed to financial and non-financial metrics. Financial metrics may include profits, costs, and investments, volume of sales while non-financial metrics may include employee satisfaction, customer satisfaction, repeat purchase and corporate image. Further, Mutia (2011) ascertains that organization performance can be measured using indicators such as effectiveness, efficiency, change implementation, product development, expansion and financial viability (Mutia, 2011).

Similarly, Kasmi (2011); Katua, Mukulu and Gachunga (2014) acknowledge that organizational performance can be measured using the firm's ability to develop new products and services, maintain close links with key stakeholders, incur minimal social and economic costs, integrate technology in the system, manage employee resistance to change and re-engineer business processes for efficiency and effectiveness. Further, Hassan (2014) attests that despite organizational performance may be measured in different ways from context to context, to a larger extent, parameters such as customer satisfaction, profits, process automation and learning and innovation are used to evaluate competitiveness of any organization.

1.1.3 Public Universities in Kenya

UNESCO (2016) suggests that growth of University education in Kenya can be traced back to 1922 when Makerere college was established a Technical college to admit students from Kenya, Uganda and Tanzania. As a result, in 1949 and 1954, Makerere College was necessitated to enter into special relations with Universities from London to enable Africans to study for degree programs. Later in 1954, Makerere College was converted to be the University College of East Africa. In 1970, it was decided by the African Authority to split University of East Africa into three major Universities which included: Makerere University (Uganda,) University of Dar es Salaam (Tanzania), and the University of Nairobi (Kenya). Since 1970, to date, the University Education has experienced rapid growth.

The number of universities offering degree programs have increased significantly thus resulting to increased number of student enrollment. According to the Ministry of Education Report (2016), Chartered Public Universities have continued to record increased number of student enrollment in various certificate, diploma, degree and postgraduate programs due to Governments initiatives to promote quality education to all Kenyans as spelt out in vision 2030. With increased competition from international and local private Universities, Chartered Public Universities have continued to experience a number of challenges to accommodate the increased number of students. Some of these challenges are: accreditation of academic programs, lecturer verses student ratio, inadequate infrastructural facilities and capacity of the teaching staff.

As a result of the integrity questions raised from key stakeholders in the education sector with regard to quality of education in higher institutions of learning in Kenya, the Commission for University Education (CUE) was established under the Universities Act, No. 42 of 2012 to replace Commission for Higher Education to oversee and regulate university education in Kenya (Ministry of Education, 2016). However, despite the establishment of Commission for University Education in Kenya, Public Universities in Kenya are experiencing several challenges such as employee strikes and inequitable workloads, poor remuneration and career stagnation among others.

1.2 Statement of the Problem

According to the survey conducted by the Salaries and Remuneration Commission (2016) it was revealed that majority (96%) of public organizations and more specifically Public Universities in Kenya are experiencing deteriorating. The real issues which are attributed to deteriorating performance among Public Universities include; inability of employees to develop their careers, non-existence of policies that promote staff development, poor remuneration policies, poor working conditions (Magutu, Mbeche, Bitange, Onserio Nyaanga & Ogoro, 2010). Despite the fact the SHRM practices are attributed to improved organization performance, it is noted that little has

been done by previous studies conducted globally and locally to address issues of SHRM that influence performance of Public Universities in Kenya.

Extensive studies conducted globally by and locally Abdus (2011); Adnan &Izzat (2012); Ali et al. (2016); Kilika et al. (2015) &Thiriku & Were (2016) demonstrate that Strategic Human Resource Management practices are correlated to organizational performance. Another study conducted by KIPPRA (2016) also revealed that there was a mismatch between employees' qualifications, salaries paid and duties performed. Consequently, extensive studies conducted in Kenya by Ligare (2010); Maina (2011); Odunga (2011); Mutia, (2011); Mbondo (2011) & Manguru (2011) have failed to examine variables of this study in the university context.

A study by Adnan and Izzat (2012) was confined to human resource management practices in commercial banks in Israel. A study by Ali et al. (2016) was limited to oil and gas companies in Iraq. A study by Masaiti and Naluyele (2011) examined strategies to retain and motivate employees among employees of the ministry of education in Zambia. A study by Kiiru (2013) was limited to SHRM practices in State Parastatals in Kenya. Further, a study by Kilika, K' Obonyo, Ogutu and Munyoki (2016) examined the relationship between human resource development infrastructure and university performance. Moreover, a study by Ligare (2010) was limited to State corporations in Kenya. A study by Maina (2011) was confined to secondary schools in Kenya and a study by Mbondo (2011) was limited to Kenya Police Staff SACCO Ltd.

However, from the findings of empirical studies, it is noted that there exist deficiencies in evidence on the link between SHRM and performance of organizations. First, it is noted that each study examined different variables partially and in isolation and failed to examine the combined variables of this study on performance of selected Public Universities in Kenya. Second, the studies conducted were confined to different geographical and cultural backgrounds thus difficult to generalize. Third, each study adopted different data analysis methods which resulted to inconsistencies in research findings. Therefore, it is on this premise this study sought to investigate the effect of Strategic Human Resource Management practices on the performance selected Public Universities in Kenya.

1.3 Purpose of the Study

To assess the effect of Strategic Human Resource Management practices on performance of selected Public Universities in Kenya.

ISBN 978-9966-132-53-6 @ Copy Right .2019

1.4 Objectives of the Study

1.4.1 General Objective

The general objective of the study was to assess the effect of Strategic Human Resource Management practices on the performance of selected Public Universities in Kenya.

1.4.2 Specific Objectives

The specific research objectives that guided this study were:

(i) To establish the effect of human resource planning on performance of selected Public Universities in Kenya.

(ii) To determine the effect of staffing and retention on performance of selected Public Universities in Kenya.

(iii) To assess the effect of training and development on performance of selected Public Universities in Kenya.

1.5 Research Hypotheses

The research hypotheses that guided this study were:

H_{01}: There was no relationship between human resource planning and performance of selected Public Universities in Kenya.

H_{02}: There was no relationship between staffing and retention and performance of selected Public Universities in Kenya.

H_{03}: There was no relationship between training and development and performance of selected Public Universities in Kenya.

1.6 Significance of the Study

This study may add new insights to the world of knowledge thus the need for Public Universities to embrace SHRM in order to enhance performance. Management of Public Universities may find this information essential in formulating human resource plans that promotes employee welfare thus enhanced productivity. The information may help management of Public Universities improve employee working conditions and review policies of engaging workers to enhance performance. Policy makers such as the, Salaries and Remuneration Commission, Trade unions, Ministry of Education, Commission for University Education and other International Stakeholders such as UNESCO may use the information to formulate policies that would contribute to improved performance of Public Universities in Kenya. The information may help scholars, academicians and researchers to enhance their literature and propose new models of solving the problem under investigation.

ISBN 978-9966-132-53-6 @ Copy Right .2019

1.7 Scope of the Study

This study sought to establish the effect of Strategic Human Resource Management practices on the performance of selected Public Universities in Kenya. The study was limited to Public Universities as shown in appendix (3). Universities were chosen based on the number of years of operation, number of academic programs offered, infrastructural facilities in place and ISO certifications. The independent variables of the study were: strategic human resource planning, staffing and retention and training and development while the dependent variable was performance of selected Public Universities in Kenya.

1.8 Limitations of the Study

It was anticipated that some respondents were to be reluctant in giving the intended information once questionnaires are administered. This limitation was overcome by the researcher clearly stating the objective of the study and providing assurance of confidentiality of the information given. It was anticipated that some of the empirical studied that were reviewed in this study were carried out in different geographical and cultural contexts. However, this limitation was overcome by this study focusing on higher education sector in Kenya which is different from developed countries. Some of the information used in this study may have been obtained from sources which were biased during data analysis due to the number respondents involved, sampling design, instruments and data analysis methods. However, this limitation was overcome by this study using simple random sampling, questionnaires and multiple regression method in analyzing data.

1.9 Organization of the Study

Chapter one the study provides background of the study, statement of the problem, objectives of the study, hypotheses, significance, scope and limitations of the study. Chapter two outlines theoretical review, empirical review, summary of literature review and knowledge gaps using a table and finally conceptual framework illustrating the association between variables. Chapter three provides. Chapter there discusses the research design, the target population, sample size and sampling procedure, data collection, collection procedure, validity and reliability, data analysis and ethical considerations. Chapter four presents data analysis, findings and discussions in relations to objectives of the study and chapter five discusses the summary of findings, conclusions and recommendations.

ISBN 978-9966-132-53-6 @ Copy Right .2019

CHAPTER TWO

LITERATURE REVIEW

2.1 Introduction

This chapter presents the literature review on strategies human resource management and organizational performance. It presents the theoretical review, empirical review, summary of literature and knowledge gaps and finally conceptual framework.

2.2 Theoretical Literature

This study was anchored on empowerment theory and supported by other two theories which includes Herzberg's two factor theory and human capital theory.

2.2.1 Empowerment Theory

The theory was pioneered by Zimmerman (1992). The theory argues that empowerment is process equipping employees with relevant skills and knowledge to performance various tasks more competently. Achieving organizational goals in any context is thought to be a function of employee empowerment (Viljoen, 2004).Continuous development of employee skills and providing the necessary support not only improves overall productivity of the organization, but also enhanced employee motivation to perform and exceed organizational goals.

Thiriku and Were (2016) attest that even though empowerment is viewed differently from context to context, to some extent is interpreted as the ability of the organization to provide the necessary support, information and opportunities to employees. Futuristic thinking organizations are always dedicated in empowering their workers to achieve their goals in a more efficient and effective manner. It is argued by Kavoo and Kiruri (2013) that empowering employees psychologically can result to improved organizational productivity. Feeling of competence, freedom in decision making and value of the job can significantly lead to organizational growth in terms of positive behaviours, profits, creativity and innovation and minimal resistance to change

Spanos and Lioukas (2011) opine that employee empowerment is the extent to which managers of an enterprise can promote employee talents in order to achieve the best results. Delegating responsibilities, training workers, job rotation, promotions, job enrichment and financial support are some of the factors that enhances employee empowerment. Empowerment of employees is viewed to be a direct function of organizational competitiveness from context to context (Gopal, 2012).This theory was applicable in this study on the premise that Public Universities are

likely to enhance their performance by adopting strategic human resources plans such as recruitment, succession, compensation and retirement plans to enhance their performance.

2.2.2 Herzberg's Two Factor Theory

The theory was founded by Herzberg in 1969. Motivation-Hygiene Theory argues that employees are likely to work effectively if motivated by intrinsic and extrinsic factors. Hygiene factors are regarded to be those job factors which must be existent at the workplace for employee to be motivated to work (Kasmi, 2011). Non-existence of these factors in an organization can lead to dissatisfaction even though they do not guarantee positive satisfaction. Hygiene factors when adequate in an organization can make employee to be motivated to perform and vice versa. Hygiene factors are also called as dissatisfies or maintenance factors as they intervene to minimize levels of employee dissatisfaction (Heggested & Mingo, 2011). The hygiene factors that can make employees perform may include reasonable pay and wages, flexibility of administration policies, fringe benefits attached to employee positions, conducive working environment, good interpersonal relations among workers and job security (Greenidge, Alleyne, Parris & Grant, 2012).

Aguenza and Som (2012) argue that hygiene factors only cannot be considered to be the only motivators but also other factors termed as satisfiers can enhance employee motivation to perform such as recognizing the effort of hard working employees by top level managers, employee capacity to have a sense of achievement from the job, ability of the employee to develop his or her career in the system through promotions, ability to perform delegated duties effectively and meaningfulness of the work. Employee s in an organization are likely to behave positively towards organizational goals if they find their jobs to be interesting or exciting and vice versa (Bal et al., 2012)

Despite extensive application of Motivation-Hygiene Theory in human resource management literature by Farman, Kashif., Syed, Muhammad and Muhammad (2013); Greenidge, Alleyne, Parris and Grant (2012) and Kimani (2010), it is observed that the theory has some limitations which make operationalization and contextualization of its constructs to be uncertain. Theory assumes the correlation between satisfaction and productivity (Ligare, 2010). Further, it is observed that satisfaction is multidimensional facet which is influenced and determined by multiple aspects thus complex to be measured from context to context.

Additionally, it is observed that despite adequacy of satisfiers in an organization, to some extent, organizations may fail to accomplish their goals in the long term period (Ghansah, 2011). The level of excitement and satisfaction among workers is not correlated to productivity and vice versa. However, this theory is applicable in this study based on the premise that Public Universities are likely to perform effectively if they refocus on human resource planning, staffing and retention, training and development. (Adnan &Izzat, 2012)

2.2.3 Human Capital Theory

The theory was propounded by Becker in 1993.The theory argues that investment in employee is thought to be a function of organizational performance. Employees who are equipped with the right mix of knowledge, skills and experience are likely to performance effectively. According to Abdullah (2014) recruitment and retaining workers with unique skills and knowledge is one of the factors that promote organizational growth in the changing business context. Employee capabilities and skills are drivers of creativity and innovation any competitive organization.

Afzal et al. (2013) assert that creating an enabling environment that promotes employees' talents or career growth can stimulate organizational performance. Organizations that invest in training employees are more likely to perform effectively as compared to those that consider employee training as a cost. Creating a share mental model of solving problems using scientific knowledge is one of the fundamental factors that triggers employee motivation. Introduction of advanced systems in any organization is purely dependent on employee knowledge and capacity to operate them (Markos & Sridevi, 2010). Inefficiency of any organization is attributed by inability of employees to learn new skills, lack of management support, structural rigidity, poor leadership and lack of self-initiative among workers.

Mutahi and Busienei (2015) suggests that firms are likely to be competitive if they recognize the need for talent development. Similarly, Ghazala and Habib (2012) demonstrate that to survive in a highly competitive business environment, companies not only need to equip workers with knowledge and skills but also provide supportive environment that natures new and existing talents. Introduction of technology and equipment can give employees new insights on how to perform different tasks using the new platforms thus enhanced service delivery.

The theory was applicable in this study on the premise that Public Universities in Kenya are likely to boost their performance by investing in employees. Improving working conditions, providing job security, sponsoring workers for further studies would result to enhanced performance of Public Universities in Kenya. Training and development initiatives such as departmental research and periodical trainings among non-teaching staff would result to improved performance of Public Universities in Kenya.

2.4 Empirical Literature

2.4.1 Human Resource Planning and Organization Performance

Afsal et al. (2013) suggest that human resource planning is one of the HR competitive practices that enhance organizational productivity. Organizations should always seek to identify people with the right mix of knowledge and skills to perform. Organization that do not have clear HR plans are likely to fail. Further, it was observed that their

research work was limited to human resource planning in telecommunication sector in Pakistan and found out that there exists a significant effect between human resource planning and organizational performance. Moreover, the study sought to examine determinants of HRP such as selection, training and incentives on organizational performance.

In contrast, this study will seek to establish the effect of Strategic Human Resource Management practices on the performance of selected Public Universities in Kenya. The independent variables of the study will be strategic human resource planning, staffing and retention and training and development while the dependent variable was performance. In this study it will look at the real issues which are attributed to deteriorating performance among Public Universities which include; inability of employees to develop their careers, non-existence of policies that promote staff development, poor remuneration policies, poor working conditions (Magutu et al., 2010).

Chebet (2015) also established that effective HR planning was the only way organizations are using to meet customer demands in the changing business environment. Organizations should engage HR professionals to conduct employee needs assessment. However, the study focused on examining the influence of compensation, leadership, training, working conditions on performance of the employees at the County government of Bungoma. The target population comprised of 5,900 employees of Bungoma County government. The study adopted a descriptive survey research design and a sample size of 375 was chosen using stratified random sampling whereby the strata was represented by the levels of management which were top, middle and lower management levels. Data was analysed using descriptive statistics that failed to establish the statistical effect between variables of the study. In contrast, this study focused on selected Public Universities in Kenya to examine the relationship between Strategic Human Resource Management on performance.

Dauda et al. (2010) assert that human resource planning is directly correlated organizational growth. Inability of organization to achieve the set standards is attributed by system rigidity to accept new changes such as technology. Further the study observed that inability to have succession and talent development plans can hinder successful organizational growth from context to context. Even though organizations experience various challenges when implementation strategic planning policies, understanding the past, present and future needs of the organization is one of the fundamental factors that enhance organizational competitiveness (Ondieki et al. 2017).

Spanos and Lioukas (2011) attest that organizations operating in the changing business environment should consistently embrace strategic human resource planning in order to meet future needs of customer. Companies that fail to articulate the right number of employees and a mix of knowledge and skills required to perform more

effectively may cease to exist in the competitive business environment. Identification of appropriate techniques of determining the required number of employee in the organization can create a significant effect on organizational growth. However, it was noted that the study was confined to Strategic Human Resource Management practice and corporate performance of Small Business Enterprises in Lagos Metropolis but failed to focus on issues in higher education sector in Kenya.

Hassan et al. (2013) established that there exists a difference between number of workers and organizational output. The study revealed that to some extent, the larger number of workers in an organization may not reflect the real output if effective mechanisms are not put in place to determine input and output. Continuous development of employee skills and knowledge is seen to be one of the drivers of organizational performance. Despite the positive correlation between Strategic Human Resource Management and performance of organization, it was observed that the study was limited to training and development impact among Oil and Gas Sector of Pakistan but failed to examine the integrated approach of SHRM variables of this study on performance of Public Universities in Kenya.

2.4.2 Employee Staffing and Retention and Organization Performance

Namusonge, Kabare and Kagwiria (2014) revealed that employee staffing and retention were aspects that were determined by managing employee talents. It was pointed out by the study that if appropriate strategies are not embraced by organizations, retaining employees may be a challenging task in the changing business context. Moreover, the concern about the scarcity of talent is almost universal.However, it is observed that the study examined variables of this study in isolation but not in a combined manner. Odunga (2011) contend that organizations around the world are competing for the similar pool of capacities. However, organizations are finding it hard to attract and retain competent workers. Issues of compensation, working conditions and opportunity for career growth are top priorities of aggressive workers. Nevertheless, it was noted that the study was confined to construction companies in Kenya but failed to focus on issues in higher education sector in Kenya.

Ibullah et al. (2016) found out that most of the organizations are experiencing high employee turnover due to inability retain workers. Organizations operating in the changing business environment may find it difficult to compete due to inability to provide an environment that promote employee welfare such as flexible schedules, promotions, training, job design, job enrichment, performance appraisal and salary review. However, it was noted that their study was limited to retention and organizational performance and competitiveness of firms in the banking sector in positioning in Nigerian but failed to focus on higher education sector in Kenya.

Mutua, Karanja and Namusonge (2012) ascertained that when organizations losses workers it automatically losses its competitiveness in terms of skill, experience and corporate memory. To enhance productivity of any organization,

retaining employees who are highly qualified is one of the determinants that triggers employee internal insights to find alternative means of achieving organizational objectives. Further, the study noted that organizations may turn to be trainings grounds for well established companies. Companies that fail to identify unique skills of workers and develop them are likely to be the losers in the long term However, it was noted that the study was confined to the role of human management practices on performance of financial cooperatives based in Nairobi County, Kenya but failed to address SHRM practices on performance of Public Universities in Kenya.

Mbondo (2011) posits that employers are experiencing challenges of employee retention due to changing labour laws and employee drive to develop their career potential within the shortest time possible. Management styles, inflation rates and skills of workers can influence employee retention directly or indirectly in any context. Dissatisfied workers not only taint the image of the company but also contribute to organizational stagnation and rigidity to changes. Nevertheless, it was observed that the study was restricted to Strategic Human Resource Management practices at the Kenya Police Staff SACCO Ltd and studied variables of this study in isolation.

Maina (2011) postulate most of the organizations that are ranked top in service delivery are directly attributed to effective compensation policies, career growth, flexible working environment and employee recognition. Good relations among workers, delegation, consultation and autonomy in decision making are some of the factors that promote organizational performance if effectively embraced in any competitive system. However, it was noted that the study was limited to Strategic Human Resource Management practices applied in performance of the top five secondary schools North District of Kajiado County, Kenya but failed to examine the integrated approach of the variables of this study on performance of Public Universities in Kenya.

2.4.3 Employee Training and Development and Organization Performance

Ligare (2010) established that there is a relationship between employee training and development and performance among organizations. Employee training entails a combination of essential abilities that involve the development of a knowledge base, expertise level and mindset that is increasingly necessary for success in the modern workplace. Employability skills are typically considered essential qualifications for many job positions and hence have become necessary for an individual's employment success at just about any level within a business environment. In contrast, this study used questionnaires to collect data and multiple regression method to establish the relationship between variables.

Kilika et al. (2012) contend that the ability of employees to share information and learn new skills that will facilitate effective implementation of strategy. Well trained employees are likely to have a wide understanding of the business environment and adjust quickly to changes with minimal resistance to change. However, it was pointed out that their

study was limited to understanding the design of human resource development infrastructures for knowledge intensive organizations: an empirical evidence from Public Universities in Kenya.

Katua, Mukulu and Gachunga (2014) argue that achievement in the workplace deals with the pride and sense of accomplishment employees feel about their jobs and employers. Managers who notice a decline in achievement must take proactive steps to implement strategies to increase motivation and employee morale. Training is one of non-financial rewards that drive and empower workers to work towards organizational strategic intent. Human resource management is primarily concerned with the management of people within organizations, focusing on policies and on systems. The study revealed that the responsibilities of a human resource manager can fall into three roles which include; staffing, employee compensation and benefits, and defining/designing work. However, their studies were limited to the effect of employee resourcing strategies on the performance of commercial banks in Kenya but failed to address the combined SHRM variables of this study on performance of Public Universities in Kenya.

Kavoo and Kiruri (2013) on the other hand noted that the purpose of human resource management is to maximize the productivity of an organization by optimizing the effectiveness of its employees. In addition, it entails, conducting job analyses, planning personnel needs, recruiting the right people for the job, orienting and training, managing wages and salaries, providing benefits and incentives, evaluating performance, resolving disputes, and communicating with all employees at all levels. However, it was revealed that the study was confined to the effect of placement practices on employee performance in small service firms in the information technology sector in Kenya but failed to examine variables of this study on performance of higher education sector in Kenya.

Kiiru (2013) assert that employees should have skills to enable them solve problems, being flexible with project changes and taking feedback from other workers. Employees often work together on projects, so some employees must take on the leadership role to ensure deadlines are met, problems are addressed and all ideas are being considered. Employers often seek employees who have natural leadership skills. In addition, these employees must also have creativity skills so they can find and use solutions for potential problems on tasks, projects or assignments. However, it was pointed out that the study was limited to State parastatals in Kenya and studied variables of this study in isolation such as training and compensation.

Hafiza (2015) pointed out that talent management can be the best way to create a long term competitive advantage. A sustainable competitive advantage stems from the valuable company specific resources that cannot be imitated or substituted by competitors. Human capital, rational capital and structural capital can all be sources of long term competitive advantage but the most significant evidence favours human capital. Nevertheless, it was observed that the

study was limited to the impact of training and development on organization performance with mediating role of intention to quit as human resource quality cost.

Gopal (2012) revealed that skills development as an organizational development intervention with the purpose of strategically focusing the individual towards future organizational demands. Furthermore, developing talent is an important managerial function, since the continuous improvement of all organizational systems and products is dependent on it. However, the study was confined to talent management and performance of firms in India but failed to address issues in the higher education sector in Kenya. Regarding the factors necessitating skills development, the balance should be created between developing individual talent and adding value to the organization (Gitonga, Kilika & Obere, 2016).

Ali and Nur (2016) contend that measuring of talent is based on confidence, skills expression, virtue expression, physical wellness, mental wellness, relationship wellness, spiritual wellness and personal leverage. High performance organisations are characterised as living their vision, implementing strategic and business plans, writing and evaluating scorecards, setting benchmarks and enforce ranking. A culture of achievement stems from strong values and beliefs. A culture of achievement supports tools of motivation and measurement of individual, group and organisational performance. However, it was revealed that the study was confined to the role of recruitment and selection practices in the organizational performance of Iraqi oil and gas sector but failed to examine SHRM practices on performance of Public Universities in Kenya.

Thiriku and Were (2016) assert that organizations cannot compete if employees' talents are not developed through clear policies of career development. They argue that organizations should adopt scientific approaches of determining the present and future demand of products and accurately determine the number of workers who can handle the demand. However, their study was to examine the effects of talent management strategies and employee retention among the private firms in Kenya with a case of Data Centre Ltd. In contrast, this study sought to investigate the effect of Strategic Human Resource Management on performance of selected Public Universities in Kenya.

Further it is noted that the study was confined only to one variable of this study; talent management which was treated as an antecedent of this study and discussed under training and development variable. The research design used in this study was descriptive research design. The target population for this study comprised of 76 employees of Data Centre Limited (DCL). Further, this study will adopt descriptive research design approach to investigate the effect of Strategic Human Resource Management on performance of selected Public Universities in Kenya. The target

population of the study will comprise of 53 human resource managers and officers of selected Public Universities in Kenya. Purposive sampling technique was used to select the representative sample size of the population.

Table 2.1: Summary of Research Gaps

Author	**Focus of the Study**	**Methodology and Findings**	**Knowledge Gaps**	**Focus of the Current Study**
Ondieki ,Nyang'au & Mbura(2017).	Influence of strategic management practices on productivity of state corporations in Kenya: A case of Kenya Civil Aviation Authority.	Adopted descriptive research design and a case study to select 155 employees of Kenya Civil Aviation Authority The study established that there exists a significant effect between SHRM on productivity of State Corporations.	Independent variables of the study were organizational policies, organizational strategies and leadership style. A case study of Kenya Civil Aviation Authority.	Dependent variables of the Study will be human resource planning, staffing and retention and training and development. The study will focus 10 selected Public Universities in Kenya
Ali et al. (2016)	The Role of Recruitment and Selection Practices in the Organizational Performance of Iraqi Oil and Gas Sector	Descriptive and convenient sampling technique was used to select 113 employees of oil and gas companies in Iraq It was established that there was a correlations between recruitment, selections and performance	Variables of the study were selection, training and incentives Phenomenological paradigm was adopted and exploratory research design Data was analyzed descriptively	The study will seek to examine the effect of human resource planning, staffing and retention and training and development and performance of selected Public Universities in Kenya Positivist paradigm will be adopted and cross-sectional research design to discover new knowledge and test hypotheses based on the laws of cause and effect. Multiple regression will be adopted to test the statistical effect between variables
Kilika, K' Obonyo, Ogutu, &Munyoki (2016)	The Mediating Role of University Industry Collaboration on the Relationship between Human Resource	Single case design and random sampling technique was used to select 76 employees of	The study examined the mediating role of university industry collaboration on the relationship between	The study will test the direct relationship between strategic human resource

	Development Infrastructure and Performance of Universities in Kenya	Data Centre Limited. It was established that human resource develops influence performance Data was analyzed descriptively.	human resource development infrastructure and performance of universities in Kenya. A single case design.	planning, staffing and retention and training and development and performance of selected Public Universities in Kenya. 10 Universities will be the unit used to select the sample size Data will be analyzed using multiple regression method.
Mutahi&Busienei (2015).	Effect of human resource management practices on performance of Public Universities in Kenya	Descriptive research design was adopted. A census approach was used The study revealed that there exists a difference between HRM and performance of Public Universities in Kenya.	The dependent variables of the study were resourcing practices, reward management, training and development The study was took a census approach	The study will seek to investigate the relationship between SHRM on performance of selected Public Universities in Kenya. The study will adopt stratified sampling technique to select 10Public Universities in Kenya.
Farman et al. (2013)	Effect of Human Resource Planning on Performance of the Telecom Sector in Pakistan	Purposive sampling was used to select 160 employees of telecommunication companies in Pakistan Data was collected using interview guides and questions. Factor analysis method was used to analyze data. The study established that there exist a significant relationship between HRP and Performance	Independent variables were training, selection and incentives. Interview guides were used to collect data Factor analysis method was adopted	The study will examine the relationship between Strategic Human Resource Management and Performance of selected Public Universities in Kenya. Stratified Sampling Will be used to select respondents Questionnaires will be used to collect data Multiple regression will be

				used.
Kiiru (2013)	Strategic Human Resource Management practices and performance of parastatals in Kenya	Adopted positivist research design Used both descriptive and exploratory research design To select respondents from 185 parastatals in Kenya Established that compensation, training, recruitment and performance management influenced organization performance.	The study focused on SHRM practices among State Parastatals in Kenya The study tested the moderating effect of between SHRM and performance of State parastatals Exploratory research was used Respondents were employee of parastatals in Kenya	The study will test the direct relationship between strategic human resource planning, staffing and retention and training and development and performance of selected Public Universities in Kenya. Cross-sectional research design will be adopted Respondents will be employee of HRM department of selected Public Universities in Kenya.
Maina (2011)	Strategic Human Resource Management practices applied in performance of the top five secondary schools North District of Kajiado County, Kenya	Longitudinal research design was adopted Quota random sampling technique was used to select 111 teachers of secondary schools Revealed that employee training and motivation was directly correlated to organization performance	The variables of the study were human resource policies, talent development and compensation. Non-probability sampling technique was used. Respondents were teachers of day and boarding secondary schools	The study will be confined to Public Universities in Kenya. Probability sampling technique; stratified sampling technique will be used. The respondents will be employees of Public Universities who will constitute human resource managers and officers
Kimani (2010).	Relationship between Strategic Human Resource Management Practices and Firm Performance of the Multinational Manufacturing Companies in Kenya: the Mediating role of Technology	Descriptive design was adopted and purposive sampling technique were used to select 36 manufacturing firms in Kenya. Data was analyzed using multiple regression analysis.	The study tested the mediating effect of technology on the relationship between SHRM and performance of manufacturing firms in Kenya. Metrics of measuring performance of manufacturing firms	The study will adopt cross-sectional research design and focus universities which offer education services. Metrics of measuring university performance will

		The study established there exist a significant relationship between SHRM and firm performance.	were costs, profits, innovation and customer satisfaction	be efficiency, effectiveness, employee satisfaction, customer satisfaction and corporate image.

2.5 Conceptual Framework

Figure 2.1 depicts the relationships between human resource planning, staffing and retention and training and development on performance of selected Public Universities in Kenya.

Independent variables **Dependent Variable**

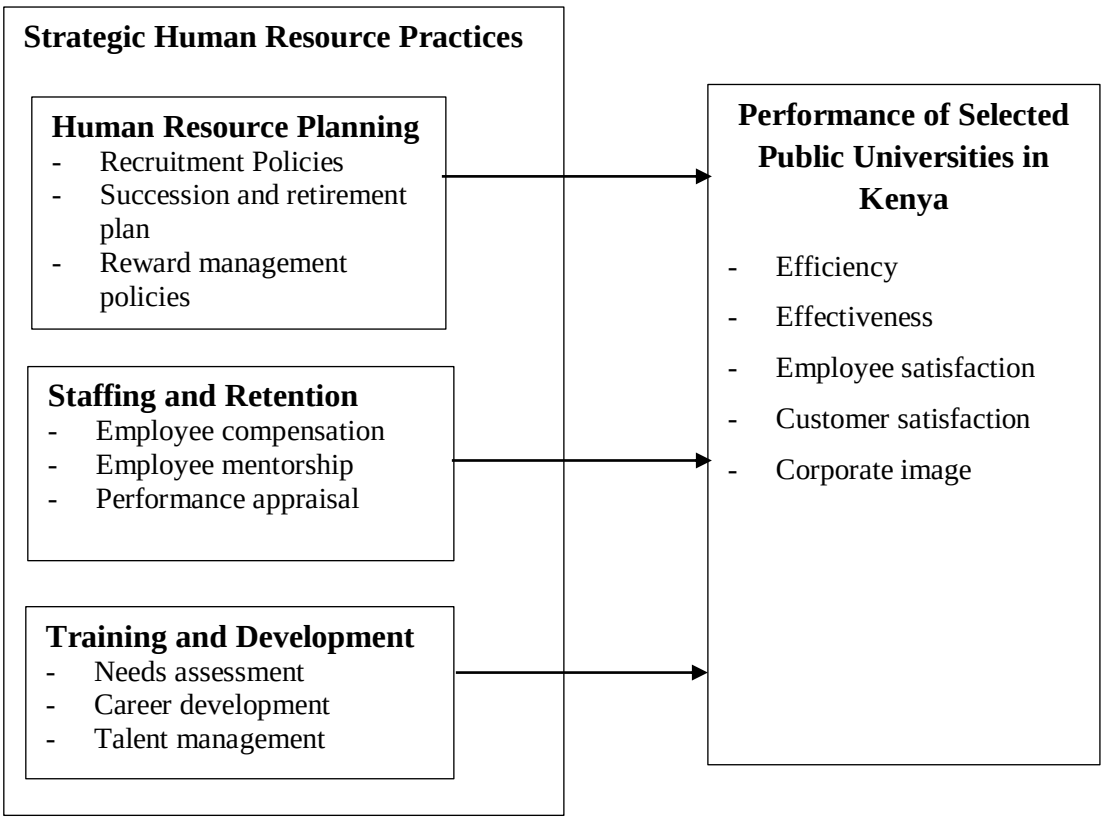

Figure 2.1: Conceptual Framework

Source: (Author, 2019)

Figure 2.1 illustrates that human resource antecedents such as recruitment Policies, succession and retirement plan and reward management policies had a significant positive effect on performance of Public Universities in Kenya. Performance of Public Universities was measured in form of efficiency, effectiveness, employee satisfaction,

customer satisfaction and corporate image. Staffing and retention antecedents such as employee compensation, employee mentorship and performance appraisal had a significant positive effect on performance and finally training and development antecedents such as needs assessment, career development and talent management had a significant positive effect on performance of Public Universities in Kenya.

CHAPTER THREE

RESEARCH METHODOLOGY

3.1 Introduction

The chapter presents the research design, target population, sampling design, data collection procedure, validity and reliability, data analysis method and ethical considerations.

3.2 Research Design

The study adopted a descriptive research design to establish the effect of Strategic Human Resource Management and performance of selected Public Universities in Kenya. Novikov and Novikov (2013) describe a research design as an overall plan of collecting analyzing and interpreting data to control a problem under investigation. The descriptive research design was considered appropriate in research because it facilitates discovery of new knowledge and helps to establish whether there exists a relationship between variables of the study. Further, it provides that opportunity to collect data from a sizeable sample with homogenous features. Moreover, it helped to analyze data using both quantitative approach and qualitative approach. In addition, it helped to verify findings using principles of existing theories and empirical findings.

3.3 Target Population

A population is described as the total number of elements with common observable features where researchers obtain information from (Collis & Hussey, 2014). The study targeted53employees from human resource department of the 10 selected Public Universities in Kenya. The years of operation and number of students were the criteria of selecting the 11 Public Universities operating in Kenya.

Out of the 13 selected Public Universities, a total population of 914 employees from teaching and non-teaching staff members were participants of this study. The unit of analysis were employees of selected Public Universities while unit of observation were selected Public Universities. The selected Public Universities from which the target population was obtained are shown in Appendix (3).

3.4 Sampling Technique and Sample Size

Mertler and Vannatta (2010) defines a sample size as the representative of the whole. A sample size selected in any study should be ideal of to represent the entire population using a scientific criterion. Similarly, Guest (2010) define a sampling technique as a process of selecting respondents of a study which may take a probability or non-probability approach. In this regard, the study adopted simple random sampling technique to obtain information concerning the problem under investigation.

Since the population of the study was finite and working in the university context, the respondents of the study included: lecturers and members of non-teaching staff. The study adopted Israel Formula (2009) of the form n = N/1+N (e) ^{2}to determine the sample size. Where; n denotes the sample size, N denotes the total population and e denotes the error term (0.05). Therefore, Using N=914 in the formula, the calculated sample size (n) was 278 respondents as summarized in Table 3.1.

ISBN 978-9966-132-53-6 @ Copy Right .2019

Table 3. 1: Summary of Sample Size

S/N	Name of University	Total Number of Middle and Lower Level Management Employees Selected	Sampled Size	Percentage (%)
1.	University of Nairobi	76	23	30%
2.	Moi University	89	27	30%
3.	Kenyatta University	63	16	30%
4.	Egerton University	57	14	30%
5.	Jomo Kenyatta University of Agriculture and Technology	91	28	30%
6.	Maseno University	56	17	30%
7.	Chuka University	87	26	30%
8.	Dedan Kimathi University of Technology	77	23	30%
9.	Kisii University	68	21	30%
10.	Masinde Muliro University of Science and Technology	55	17	30%
11.	Pwani University	63	19	30%
12.	Technical University of Kenya	73	22	30%
13.	Technical University of Mombasa	59	18	30%
	Total	**914**	**278**	**100**

3.5 Data Collection and Procedure

This study used primary and secondary data. Primary data was collected with the help of a structured questionnaire with open-and closed ended questions. Questionnaires were considered appropriate in collecting information because they provided an opportunity for the researchers to collect information from the intended respondents without disclosing identity of respondents. Further, it helped to collect information in a structured way for systematic analysis and presentation (Fisher, 2010).

On the other hand, secondary data was obtained from published records such as employee records and commission for university education reports were reviewed and deductive conclusions were made based on the problem under investigation. The questionnaire sought to collect data using a Likert scale with five-point measurement. The questionnaires were self-administered using drop and pick later method. To ensure high response rates, follow-up were made using phone calls in order to facilitate timely analysis and presentation of data.

3.6Validity and Reliabi1ity of the Research Instrument

3.6.1 Validity of the Research Instrument

Validity is regarded as the extent to which an instrument measured what is purported to measure (Mertler & Vannatta, 2010). To ensure the research instrument collects the intended information, face, and content and construct validity

was conducted. Face validity is the degree to which the research instrument is assumed to be appropriate to collect the intended information. Content validity is the degree to which the material facts of the research instruments reflects or relates with tenets of existing theories by operationalizing the constructs. In this regard, scholars at Kenyatta University and industry human resource experts were used to evaluate face and content validity. Four respondents were used to test validity of the instrument and were not included in the final sampled population.

3.6.2 Reliability of the Research Instrument

Novikov and Novikov (2013) describe reliability as the degree to which a research instrument can generate consistent results after repeated trials using respondents with homogenous features. For any research instrument to collect consistent results in any context, internal consistency of the research instrument should be determined using scientific approach. In this case, internal consistency of the instrument was determined using Cronbach's alpha formula. To determine estimates of internal consistency, Cronbach's alpha values of 0.7were considered appropriate as proposed by Mertler and Vannatta (2010).

3.6.3 Diagnostic Tests

To ensure data was consistent with statistical assumptions, diagnostic tests such as normality, linearity, homogeneity, Multicollinearity and homoscedasticity were conducted. Normality was confirmed using Shapiro-Wilk test where data was assumed to be normally distributed if significance or p-values of the variables of the study were less that the critical value of 0.05 as recommended by (Crowther & Lancaster, 2012).Linearity of data was confirmed using Pearson's moment correlation coefficient. The study assumed linearity of data if p-values between variables were more than the critical value of 0.05. Correlation of the study variables was confirmed if there is co-movement of variables in the same direction (Guest, 2012).

Homogeneity of data was confirmed using Levene test. Homogeneity of data was assumed if variances across the range of predictor variables display equal variations as recommended by Guest (2012). Further, Multicollinearity was tested using regression method to test whether there exists a problem. If Variance Inflation Factors (VIFs) of variables was less than 10 and tolerance greater than 0.1, then there exists Multicollinearity and vice versaas proposed by Collis and Hussey (2014). In addition, hhomoscedasticity was confirmed using Levene's test where it was assumed that there is homoscedasticity if variance across predictor variables reflects equal variations as recommended by Guest (2012).

ISBN 978-9966-132-53-6 @ Copy Right .2019

3.7 Data Analysis

Data collected was edited, sorted and coded in the computer systems to facilitate analysis of the items. Statistical Package for Social Sciences (SPSS version 24) was used to analyze data quantitatively using descriptive and inferential statistics such as correlation and regression. Multiple regression was conducted at 95% confidence level and 5% significance level to determine the statistical relationship between variables of this study. The specific regression model was of the form: $\mathbf{Y= \beta o+\beta_1 X_1 +\beta_2 X_2 +\beta_3 X_3 +\varepsilon}$, Where; Yis performance of selected Public Universities in Kenya, β_0 is Y intercept, β_1 to β_3 are regression coefficients, X_1 is Strategic Human Resource Planning, $X_2$is Staffing and Retention, X_3 is Training and Development and ε are other factors not included in the model.

3.8 Ethical Consideration

The researcher sought permission from the management of selected Public Universities, Kenyatta University and National Commission for Science, Technology and Innovation (NACOSTI) before data collect process. Informed consent of respondents was sought before collecting data. Respondents was assured non-disclosure of identity for any information given. Confidentiality of the information given was guaranteed. The objective of the study was clearly spelt out to respondents of the study. Any information used in this study was acknowledge by citing the sources in the document. Collected data was analyzed objectively without fabricating and manipulating data. Respondents of the study were assured of publication of the final findings to facilitate decision making process.

CHAPTER FOUR

DATA ANALYSIS AND PRESENTATION

4.1 Introduction

This chapter presents the research findings of the study carried out to determine the effect of Strategic Human Resource Management practices on the performance of selected Public Universities in Kenya. This sought to examine the effect of human resource planning, staffing and retention, training and development on performance of selected Public Universities in Kenya. Further, discussions on the findings are made in relation to findings of existing empirical studies conducted locally and internationally.

4.2 Response Rate

The unit of analysis for this study were teaching and non-teaching staff of selected Public Universities in Kenya. A sample size of 278 respondents was selected from 13 selected Public Universities in Kenya. A total number of 278 questionnaires were self-administered to respondents but only 211 questionnaires were received from the field, 33 were inappropriately filled while 34 were not returned after administration. A total of 211questionnaires were used in the analysis and this represented 76 % response rate which was above 50% as recommended by Fisher (2010).

4.3 Population Demographics

4.3.1 Age of Respondents

Respondents of the study were asked to indicate their age and the findings were summarized as shown in Figure 4.1:

ISBN 978-9966-132-53-6 @ Copy Right .2019

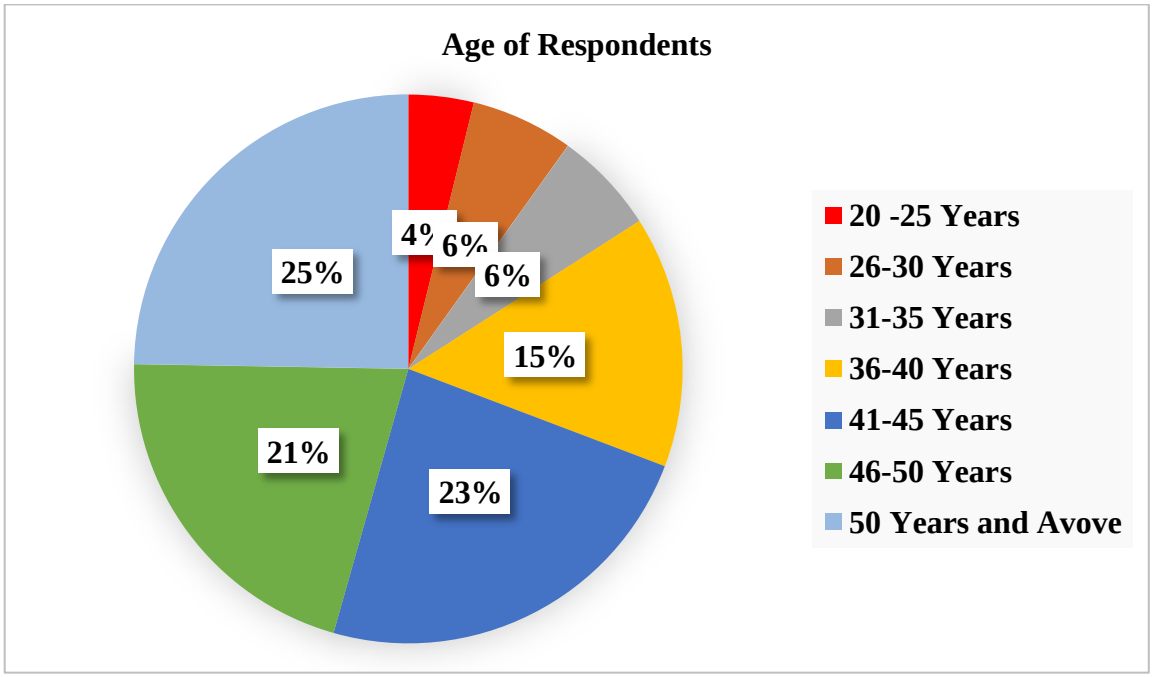

Figure 4.1: Age of Respondents

Source: Research data (2019)

As illustrated in Figure 4.1, the results indicated that the majority (25%) were aged above 50 years who comprised of senior teaching and non-teaching staff. Some (23%) of the them were aged between 41-45 years who composed on middle management and teaching staff, 21% of them were aged between 46-50 years who comprised of senior administrators and senior lecturers, 15% of them were aged between 36-40. Some (06%) of them were aged between 26-35 years who comprised of administrators while 4% of them were aged between 20-25 years who comprised on newly recruited assistant administrators. This finding imply that majority of the respondents of this study had adequate experience concerning the problem under investigation.

4.3.2 Gender of Respondents

Respondents of the study were asked to indicate their gender and the findings were summarized as shown in Figure 4.2:

ISBN 978-9966-132-53-6 @ Copy Right .2019

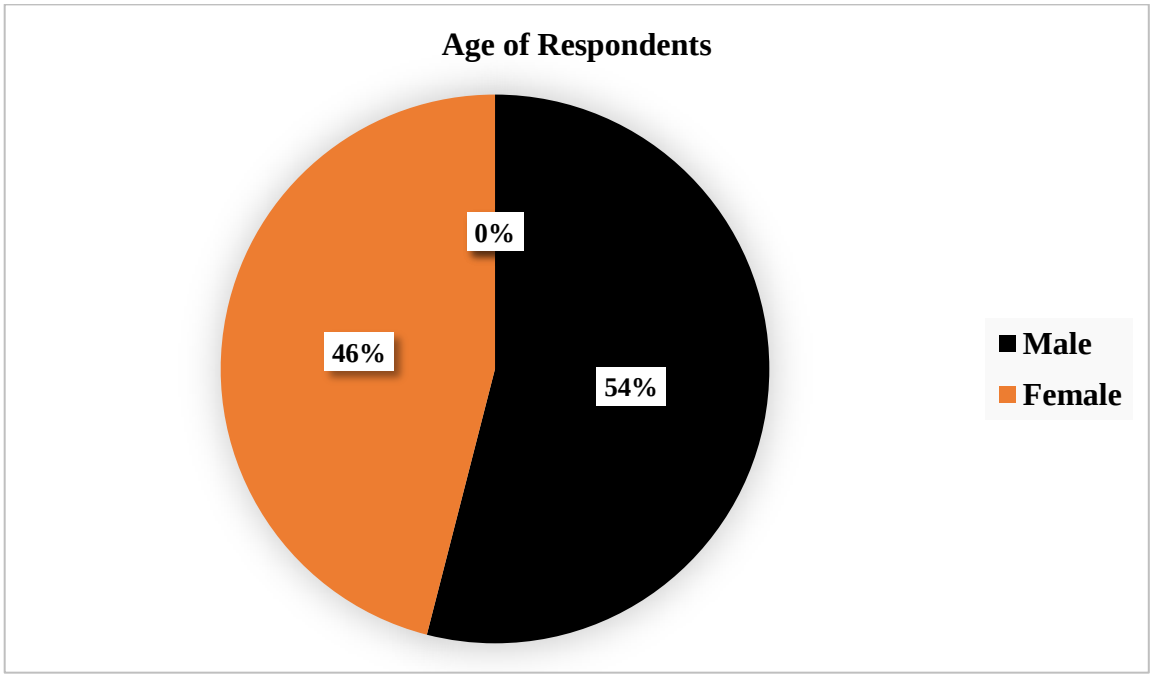

Figure 4.2: Gender of Respondents

Source: Research data (2019)

As depicted in Figure 4.2, the results indicated that majority (54%) of respondents were male while 46% of them were female respondents. These findings imply that most of the public university staff were men as compared to female employees who were less by 8%. This finding imply that most of the vacant positions in Public Universities were occupied by male employees based on the fact that female candidates who applied for the positions did not have adequate experience to occupy the positions which fall vacant.

4.3.3 Respondents Level of Education

Respondents of the study were asked to indicate their level of education and the findings were summarized as shown in Figure 4.3:

ISBN 978-9966-132-53-6 @ Copy Right .2019

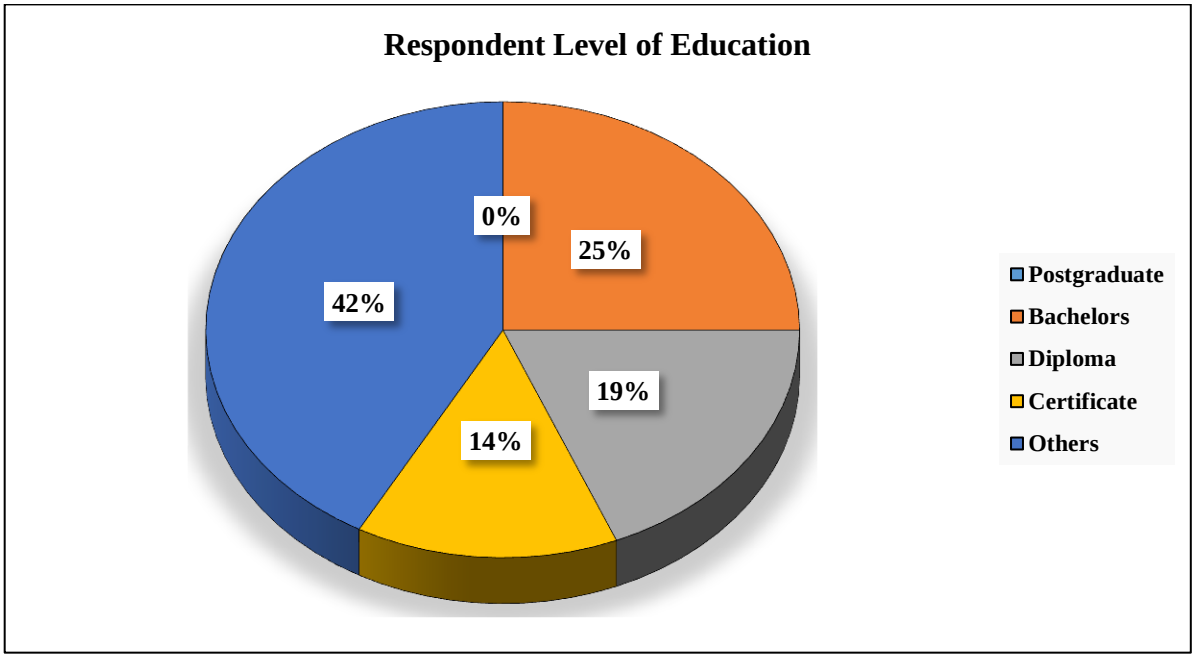

Figure 4.3: Respondent Level of Education

Source: Research data (2019)

As shown in Figure 4.3, majority of the respondents (42%) were postgraduate holders who served as lecturers and senior administrative posts. Some (25%) were first degree holders who comprised of administrators in different schools while 19% and 14% were secretaries and who served in different departments. This finding imply that most of the respondents of the study were highly qualified as it was a requirement of the commission for university education.

4.4 Strategic Human Resource Planning

Respondents of the study were asked to indicate the effect of strategic human resource planning on performance of Public Universities in Kenya and the findings were summarized as shown in Figure 4.1:

Table 4.1: Strategic Human Resource Planning

Statements	Mean	S.D
My university has the capacity to forecast future number of workers to accomplish particular tasks	4.26	.884
My university has clear policies that demonstrates how employees are engaged and rewarded after retirement	4.21	.664
My university has a clear policy that stipulates how employees in each cadre are rewarded	4.23	.587
My university recruits employees on a competitive criteria	2.11	.673
My university recruits employees with diverse knowledge and experience	4.04	.596
My university has a clear policy of employee succession	4.59	.498

My university conducts needs assessment before recruiting workers	2.98	.781
Average Mean Score	**4.45**	

Source: Research Data (2019)

Respondents of the study were requested to indicate the extent to which they agreed or disagreed with the influence of human resource planning practices on performance of performance of selected Public Universities in Kenya. As depicted in Table 1, the study revealed that the mean score for the for 5 of the 7 statements was more than the 4.00 which means that most of the respondents had agreed with the statement while the rest either disagreed or were neutral. It was indicated that strategic human planning practices such as ability to forecast for future employee influence performance with a mean of 4.26, implementation of policies of compensation after employee retirement with a mean of 4.21, policies that endorse how workers are rewarded with a mean of 4.23, recruitment of employees with diverse skills with a mean of 4.04, clarity of employee succession policies with a mean of 4.59, recruitment of employees on a competitive criteria with a mean of 2.11 and conduction of needs assessment with a mean of 2.98.

This finding imply that despite the fact that human resource planning influenced performance of selected Public Universities, to some extent some practices such as competitive recruitment and periodical employee needs assessment were not embraced effectively. It was pointed out that some universities were understaffed while others overstaffed. Further, it was noted that to some extent some State corporation were challenged to recruit employees competitively due to public service policies that advocated for a general degree for entry in public entities. Further, the results suggest that early retirement of employees from the Public Universities was unlikely due to unsatisfactory salaries. Employees were working for quite some time before being promoted.

This finding corresponds with that of Ogolla (2007), Ibullah et al. (2016), Shikha and Karishma (2012), Thiriku and Were (2016) who ascertained that strategic human resource planning did not only influence organizational to increase productivity in terms of the quantity of goods produced but also facilitated ability of the organization to identify the necessary skills and knowledge required by workers to performance effectively in a changing business environment.

4.5 Strategic Staffing and Retention

Respondents of the study were asked to indicate the extent to which they agreed or disagreed with the influence of staffing and retention on performance of selected Public Universities and the findings were summarized as shown in Table 4.2.

Table 4.2: Strategic Staffing and Retention

Statements	Mean	SD
My university engages workers on permanent basis	4.78	.884
My university provides conducive working environment for all workers	2.61	.664
My university management incorporates views of employees when making key decision making	1.58	.587
My university promotes workers based on their performance	3.47	.673
My university has a mentorship program that aims to improve skills of workers	2.33	.596
Employees of my university are always motivated to perform their duties with passion	2.10	.498
My university has adequate number of staff to perform various tasks	2.10	.4.91
My university allocates responsibilities to employees based on their specialization skills	1.03	.411
My university competitively reward employees based on their qualification and experience	2.01	.374
Average Mean Score	**3.33**	

Source: Research Data (2019)

As depicted in Table 4.2, the study found out that the mean score for 1 of the 9 statements was more than 4 which meant that a few respondents agreed with the statement while the rest either disagreed or were neutral. The study indicated that engagement of workers on a permanent basis influenced performance with a mean of 4.78, promotions based on performance with a mean of 3.47, conduciveness of the working environment with a mean of 2.61, employee mentorship with a mean of 2.33, employee motivation and adequacy of staff to perform various duties with a mean of 2.10, reward of employees based on qualifications and experience with a mean of 2.01 and allocation of responsibilities based on areas of specialization with a mean of 2.01.

The findings imply even though staffing and retention was viewed to be a practice that influence performance of selected Public Universities in Kenya, to a larger extent it was revealed that Public Universities did not provide conducive working environment to worker, involve workers in decision making, motivate workers, increase number of staff, assign duties based on individuals' skills and specialization and reward workers based on qualifications and experience. Further, the results suggest that Public Universities experienced high turnover rates based on the fact that most of the workers were engaged on contractual terms and more specifically non-teaching staff. Further, it was noted that taking early retirement among teaching and non-teaching staff was a rare practice in most of the Public Universities.

This finding concurs with that of Kasmi (2011), Kiiru (2013), Kwamboka (2016) Ligare (2010) and Manguru (2011) who elucidated that employee motivation spirit was influenced in any competitive organization through rewarding employees based on their knowledge, experience and skills. The studies pointed out that even though matching knowledge and duties allocated to employees was perceived to be a practice of private entities, to a larger extent it was attributed to organizational performance if effectively embraced. Further, it was noted that improving working environment and recognizing workers' effort were directly correlated to organizational performance. It emerged that

despite the specialization of individual workers, most of the employees were assigned general duties which did not stimulate creativity and innovation or adoption of new changes.

4.6 Training and Development

Respondents of the study were asked to indicate the extent to which they agreed or disagreed with the influence of training and development on performance of selected Public Universities and the findings were summarized as shown in Table 4.3.

Table 4.3: Training and Development

Statements	**Mean**	**S.D**
My university has a mechanism of measuring the impact of employee training	2.91	.544
My university trains workers with a long term view of customer satisfaction	2.88	.487
My university provides timely feedback after performance appraisals	2.34	.346
My university conducts career counselling to employees	2.33	.421
Top management of the university encourages lower level workers to advance their studies	2.26	.374
My university sponsors internal employees to further their studies	2.22	.343
My university conducts training needs assessment to determine the kind of trainings each employee needs to perform effectively	1.33	.268
Aggregate Mean	**4.7**	.198

Source: Research Data (2019)

As illustrated in Table 4.3, the study found out that the mean score for 6statements was less than 2 which meant that most of the respondents disagreed with the statement while the rest either agreed or were neutral. Results indicated that mechanisms of measuring the impact of employee training influenced performance with a mean of 2.91, training workers with a long term view with a mean of 2.88, feedback of performance appraisal with a mean of 2.34, counselling of workers with a mean of 2.33, management encouragement of lower level employees to advance studies with a mean of 2.26, university employee sponsorship with a mean of 2.22 and frequency of conducting training needs assessment with a mean of 1.33.

This finding are consistent with that of Gitonga, Kilika and Obere (2016), Thiriku and Were (2016), Ali and Nur (2016) who acknowledge that there exists a significant positive relationship between employee training and organizational performance in terms of service delivery. The studies attested even though in some cases there existed difference between employee training and performance, to a larger extent formal trainings among workers were considered to be catalysts of organizational performance if were effectively implemented.

4.7 Inferential Statistics

4.7.1 Diagnostic Tests

Prior to subjecting the data to regression analysis, diagnostic tests which were conducted to establish conformity with statistical assumptions such as normality, linearity, homogeneity and Multicollinearity tests were conducted as discussed:

4.7.2 Normality Test

Normality was tested using Shapiro-Wilk test, which has the ability to detect departure from normality. Its statistic

ranges from zero to one and figures $p > 0.05$ indicates the data is normal (Fisher, 2010). Shapiro-Wilk test assessed whether data was normally distributed against null hypothesis (H_0) that the sample did not follow a normal distribution.

As illustrated in Table 4.4, the four research variables had figures ranging from -0.1 to +1.0 and most of them were skewed towards +1.0. Human resource planning had the highest value of calculated probability (=0.872), whereas training and development had the lowest value of calculated probability (0.746). In this case, the resulting calculated probability values for all the research variables are greater than 0.05; therefore, at 5% level of significance the sample followed a normal distribution as recommended by Crowther& Lancaster (2012). Normality was also met since there was a large number of participants (211) involved in the study.

Table 4.4: Normality Test

Variables	**Statistics**	Df	Sig
Human Resource Planning	0.872	178	0.003
Staffing and Retention	0.811	178	0.002
Training and Development	0.746	178	0.000

4.7.3 Linearity Test

Linearity test was done using Pearson's moment correlation coefficient between Strategic Human Resource Management practices and performance of selected Public Universities in Kenya. Table 4.5, indicates that there was a positive and significant linear relationship between performance of selected Public Universities in Kenya and human resource planning, staffing and retention, training and development at 5% level of significance. The results indicate that human resource planning($r=0.556$, $p<0.05$), staffing and retention($r=0.417$, $p<0.05$) and training and development($r=0.456$, $p<0.05$). This results indicate that a unit increase in human resource planning, staffing and retention, training and development would result to an increase in performance of selected Public Universities in Kenya. The general implication of the results was that there was co-movement of variables, and in the same direction. However, it is critical to note that correlation does not necessarily mean that there is a causal relationship (Collis & Hussey, 2014).

Table 4.5: Linearity Test

Independent Variables		**Public Universities in Kenya Performance**
Human Resource Planning	Pearson Correlation	0.556**
	Sig(2-tailed)	0.001
	N	211

Staffing and Retention	Pearson Correlation	0.417**
	Sig(2-tailed)	0.000
	N	211
Training and Development	Pearson Correlation	0.456**
	Sig(2-tailed)	0.002
	N	178
	N	211

****p< 0.05**

4.7.4 Homogeneity Test

Homoscedasticity was tested by the use of Levene's Test (1960) of Homogeneity of Variances. Homogeneity of variances assumes that the dependent variable exhibits equal variance across the range of predictor variables (Novikov. & Novikov, 2013). If the variances in the two groups are different from each other, then adding the two together is not appropriate and will not yield an estimate of the common within-group variances. Therefore, the Levene Test for Homogeneity of the Variance was used to measure the equality of variances for the variables. If the test is significant (calculated probability > 0.05), the two variances are not significantly different and are thus approximately equal (Guest, 2012).

As illustrated in Table 4.6, it is indicated that the calculated probability is p >0.05 for all the three variables of the study. The calculated probability values generated from this test ranged between 0.0742 for performance of Public Universities in Kenya and 0.789 for career development. The result shows that the significance level of Levene Test is greater than 0.05, indicating variance homogeneity as proposed by (Fisher, 2010).

Table 4.6: Homogeneity Test

Variables	Lavene Statistics	df	Sig
Human Resource Planning	8.456	1	0.789
Staffing and Retention	7.432	1	0.579
Training and Development	6.334	1	0.234
Performance of selected Public Universities in Kenya.	7.324	1	0.742

4.7.5 Multicollinearity Test

To establish whether Multicollinearity would pose a problem, regression analysis was conducted. Table 4.7 indicates

ISBN 978-9966-132-53-6 @ Copy Right .2019

that all the VIFs of the five variables of the study were less than 10 and Tolerance greater than 0.1 respectively. VIF of greater than 10 and Tolerance less than 0.1 suggests Multicollinearity (Collis & Hussey, 2014) work-life balance yielded the least VIF at 0.682 career development generated the highest VIF at 0.846. This implies that there was no Multicollinearity and thus all the predictor variables were maintained in the regression model, as this is within the threshold recommended by Crowther & Lancaster (2012) & Fisher (2010).

Table 4.7: Multicollinearity Test

Model	**Collinearity Statistics**	
	Tolerance	Mean VIF
Human Resource Planning	0.846	1.568
Staffing and Retention	0.682	1.467
Training and Development	0.712	1.245
Performance of selected Public Universities in Kenya.	0.712	1.249

4.8 Correlation Analysis

Pearson's product moment Correlation Analysis was conducted at 95% confidence interval and 5% confidence level 2-tailed to assess the statistical relationship between the variables while multiple regressions was used to determine the predictive power of each independent variable on performance of Public Universities in Kenya.

Table 4.8 indicates that there existed statistical correlation between the human resources planning (0.710), staffing and retention (0.693) and training and development (0.579).

Table 4.8: Correlations Results Analysis

	Career Development	**Work-Life Balance**	**Working Environment**
	1		
Human Resource Planning	.710		
	.0012	1	
Staffing and Retention	.693	.027	
	.0017	.799	1
Training and Development	.579	.560	.762
	.0023	.000	.560

****p< 0.05**

As shown in Table 4.8, the positive relationship indicates that there existed correlation between the three variables of the study on performance of selected Public Universities in Kenya. The Significance values of the three independent variables were less than 5% (0.0012, 0.0017 and 0.0023) which indicated that a unit increase of human resource planning, staffing and retention, training and development resulted to a unit increase in performance of selected Public Universities in Kenya.

4.9 Regression Analyses and Hypotheses Testing

To establish the statistical significance of the respective hypotheses, simple and multiple linear regressions analysis were conducted at 95% confidence level.

4.9.1 Testing of Hypotheses One

H_{01}: There was no relationship between human resource planning and performance of selected Public Universities in Kenya.

Table 4.9: Regression Results of Strategic Human Resource planning and Performance of Selected Public Universities

(a)The Goodness of Fit Test

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	.774	.555	.439	.04395

(b) The Overall Significance

Model		Sum of Squares	df	Mean Square	F-test	Sig.(p-value)
1	Regression	.055	1	.055	28.372	.000
	Residual	.066	34	.002		
	Total	.120	35			

(c) The Composite Score Test

Model		Unstandardized Coefficients		Standardized Coefficients	t-test	Sig.(p-value)
		B	Std. Error	Beta		
1	(Constant)	.353	.069		5.147	.000
	Human Resource Planning	.512	.096	.674	4.327	.000

Predictor: (Constant), Strategic Human Resource Planning
Dependent Variable: Performance of Selected Public Universities

The results in Table 4.9, indicate that human resource planning had a statistically significant influence on performance of selected Public Universities. It explained 55.5 % of variation (R^2=.555). The standardized regression coefficient (β) value of the computed scores of human resource planning was .774 with a t-test of 4.327 and a significance level of p-value=. 000. The results indicate a linear dependence of performance of selected Public Universities on strategic human resource planning.

The standardized regression coefficient was used as it is free from original units of the predictor and outcome variables. This finding are consistent with that of Ogolla (2007), Ibullah et al. (2016), Shikha and Karishma (2012) who found out that strategic human resource planning was directly correlated with organizational performance. The

null hypothesis was rejected at 95% confidence level and the study concluded that human resource planning had a statistical significant effect on performance of selected Public Universities in Kenya.

4.9.2 Testing of Hypotheses Two

H_{02}: There was no relationship between strategic staffing and retention and performance of selected Public Universities in Kenya.

Table 4.10: Regression Results of Strategic Staffing and Retention and Performance of Performance of Selected Public Universities

(a)The Goodness of Fit Test

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
2	.376	.131	.116	.05795

(b) The Overall Significance

Model		Sum of Squares	df	Mean Square	F-value	Sig.(p-value)
2	Regression	.019	1	.019	5.591	.024
	Residual	.114	34	.003		
	Total	.133	35			

(c) The Composite Score Test

Model		Unstandardized Coefficients		Standardized Coefficients	t-value	Sig (p-value)
		B	Std. Error	Beta		
2	(Constant)	.554	.071		7.864	.000
	Staffing and Retention	.221	.093	.276	2.382	.014

Predictor: (Constant). Strategic Staffing and Retention
Dependent Variable: Performance of Selected Public Universities in Kenya

The results in Table 4.10 depict that the relationship between Strategic Staffing and Retention and performance of selected Public Universities is statistically significant. It explained 13.1 % of variation (R^2=.131). The standardized regression coefficient (β) value of the computed score of staffing and retention was .276 with a t-test of 2.382 and significance level of p-value= 014.The results indicate a linear dependence of performance of selected Public Universities on strategic staffing and retention. Previous studies by Kasmi (2011), Kiiru (2013) and Kwamboka (2016) concur that staffing and retention is a function of organizational performance from context to context. The null hypothesis was rejected at 95% confidence level and the study concluded that staffing and retention had a statistical significant effect on performance of selected Public Universities in Kenya.

4.9.2 Testing of Hypotheses Three

H_{02}: There was no relationship between training and development and retention and performance of performance of selected Public Universities in Kenya.

Table 4.11: Regression Results of Training and Development and Retention and Performance of Performance of Selected Public Universities

(a)The Goodness of Fit Test

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
2	.576	.231	.134	.05555

(b) The Overall Significance

Model		Sum of Squares	df	Mean Square	F-value	Sig.(p-value)
2	Regression	.011	1	.019	3.11	.014
	Residual	.126	24	.003		
	Total	.157	25			

(c) The Composite Score Test

Model		Unstandardized Coefficients		Standardized Coefficients	t-value	Sig (p-value)
		B	Std. Error	Beta		
2	(Constant)	.354	.071		6.334	.000
	Staffing and Retention	.241	.093	.176	1.282	.000

Predictor: (Constant). Training and Development

Dependent Variable: Performance of Selected Public Universities in Kenya

The results in Table 4.11 depicts that the relationship between training and development and performance of selected Public Universities is statistically significant. It explained 23.1 % of variation (R^2=.231). The standardized regression coefficient (β) value of the computed score of staffing and retention was .176 with a t-test of 1.282 and significance level of p-value= 000.The results indicate a linear dependence of performance of selected Public Universities on strategic staffing and retention. Previous studies by Kasmi (2011), Kiiru (2013) and Kwamboka (2016) concur that training and development is a function of organizational performance from context to context. The null hypothesis was rejected at 95% confidence level and the study concluded that training and development had a statistical significant effect on performance of selected Public Universities in Kenya

Table 4.12: Summary of Hypotheses Testing

	Hypotheses	Results	Decision	Conclusion
$H0_{1a}$	Strategic Human Resource planning	(r = 774 , p < 0.000).	Reject null hypothesis and adopt alternative	There was significant positive relationship between human resource planning and performance of selected Public Universities in Kenya.

			hypothesis	
$H0_{1b}$	Staffing and Retention	($r = 376$, $p < 0.000$).	Reject null hypothesis and adopt alternative hypothesis	There was significant positive relationship between staffing and retention and performance of selected Public Universities in Kenya.
$H0_{1c}$	Training and Development	($r = 576$, $p < 0.000$).	Reject null hypothesis and adopt alternative hypothesis	There was significant positive relationship between training and development and performance of selected Public Universities in Kenya.

CHAPTER FIVE

SUMMARY OF FINDINGS, CONCLUSIONS AND RECOMMENDATIONS

5.1 Introductions

This chapter presents findings of the study based on objectives which the study sought to address. Conclusion and recommendations are made and finally suggestions for further studies is made.

5.2 Summary of Findings

The study sought to examine the effect of Strategic Human Resource Management practices on the performance of selected Public Universities in Kenya, with main focus being testing the relationship between human resource planning, staffing and retention, training and development on performance of selected Public Universities in Kenya.

5.2.1 Human Resource Planning

The study revealed that there exists a positive significant relationship between human resource planning and performance of performance of selected Public Universities in Kenya. However, it was pointed out that most of the universities did not embrace human resource plans effectively. It was noted that non-teaching employees recruited in some schools did not have the required skills, knowledge and experience to perform effectively. Succession criteria was unclear and criteria of rewarding employees was also unclear. Further, it was noted that determining the right number of employees to accomplish particular tasks was attributed by internal politics.

5.2.2 Staffing and Retention

The study found out that there exists a positive significant relationship between staffing and retention and performance of selected Public Universities in Kenya. However, it was noted that some departments were understaffed and the existing workers were overworked. It was noted that some teaching staff were unsatisfied with the number of students they taught per class as it exceeded the recommended number by commission for university education. Further, some non-teaching staff were of the opinion that they were not paid for extra time worked. Lack of motivation and job security had resulted to high turnover rates among the non-teaching staff. It was also observed that universities did not replace retirees or those employees who resigned easily.

ISBN 978-9966-132-53-6 @ Copy Right .2019

5.2.3 Training and Development

The study found out that there exists a positive significant relationship between training and development and performance of selected Public Universities in Kenya. However, it was noted that Public Universities did not review employee salaries after appraisals. The universities did not sponsor non-teaching as compared to teaching staff. Further, it was observed that career counselling among workers were unlikely and it was difficult to measure the impact of any training conducted.

5.3 Conclusion

This study concludes that to some extent State owned corporations were experiencing problems such as inadequate number of staff to provide services to customers, insufficient knowledge and skills among workers to perform particular technical tasks, inability to anticipate number of workers to replace retiring, dying and resigning employees.

This study concludes that to some extent issues of staffing and retention were of great concern. Inability to involve workers' decision making, poor working conditions, unclear duties, inability to nature talents and motivate workers using promotions, trainings and recognition were among of the factors that contributed to deteriorating performance of Public Universities in terms of employee turnover, low morale and lack of creativity and innovation among workers.

This study concludes that despite the fact that Public Universities were striving to improve service delivery, to a larger extent the teaching and not teaching staff were of the opinion that sponsorships awarded were not adequate and performance appraisals had little impact on career growth and development. Junior workers were of the view that scholarships were awarded to teaching staff but not non-teaching staff.

5.4 Recommendations

The study found out that most of the Public Universities did not have non-teaching employees with specialized skills and knowledge to performance effectively. Therefore, this study recommends that top leadership of Public Universities should review recruitment policies in order to promote the spirit of specialization in Public Universities thus enhanced customer service delivery.

Further, the government should increase financial budgets to all Public Universities in order to facilitate capacity development and employee motivation for enhanced service delivery. Top leadership of Public Universities should ensure that non-teaching employees are given job security after serving for a particular period of time in order to promote quality of service delivery.

The study noted that inability to forecast of the number of workers to accomplish particular tasks was a challenge. This study recommends that human resource managers of Public Universities should engage external human resource consultants or experts to enable them predict the kind of knowledge, skills and number of staff who may be required to address service demand issues from time to time due to increased number of student enrolment in Public Universities. Moreover, top leadership of Public Universities should develop frameworks that encourage early retirement among teaching and non-teaching staff. To minimize staff turnover among non-teaching staff, human resource managers should review employee engagement policies in order to encourage staff retention and development.

Further, this study recommends that for Public Universities to excel in service delivery, the government should increase financial budgets in order to facilitate employment of teaching and non-teaching in Public Universities to address the increasing demand of academic services. The government should partner with well-wishers in order to promote capacity and infrastructural development.

5.5 Recommendations for Further Studies

This study was limited to selected Strategic Human Resource Management practices which included human resource planning, staffing and retention, training and development which may not be the only Strategic Human Resource Management practices to influence performance of Public Universities in Kenya. This study recommends that other researchers should explore on other sustainable Strategic Human Resource Management practices that can influence performance of organizations in the public service sector.

Researchers can also introduce moderating and intervening variable in the relationship to measure their direct or indirect effect on performance of organizations. Other researchers should seek to replicate a similar study in other countries and sectors to examine similarity of the results. Furthermore, researchers should go ahead and conduct comparative studies among countries in East Africa such Uganda, Tanzania and Rwanda to compare the findings in terms of performance of Public Universities.

Abstract
This paper investigates the intervening influence of selected macroeconomic factors on the relationship between fiscal policy stance and public expenditure in Kenya using VAR and VECM models. This paper is underpinned by the theory of fiscal policy, Wagner's Law of increasing state activities and Peacock-Wiseman hypothesis. The population period was 1964 to 2015. Secondary data was used and it was collected from KNBS reports. The findings indicate that foreign aid and grants have an intervening influence on the relationship between fiscal policy stance and public expenditure in Kenya. Nevertheless, fiscal stance has a statistically insignificant effect on public expenditure. The results show that fiscal stance, foreign aid and grants and public expenditure are cointegrated using the Johansen cointegration test but there is no short run causality between the variables as indicated by the Wald test statistics. The conclusion is that foreign aid and grants explain the extent to which fiscal policy stance affects the level of public expenditure in Kenya even though fiscal policy stance has a negative relationship with public expenditure.

Key words: ***Fiscal policy stance, public expenditure, macroeconomic factors, inflation, unemployment, foreign aid and grants.***

1. Introduction

Worldwide there is increased attention on fiscal consolidation especially in developing economies where there are numerous challenges in raising public revenues optimally in order to balance out with public expenditure. There is a growing trend of enacting fiscal rules across nations in order to have a balanced budget (Tsai, 2014) and also to avoid possible cases of unsustainable public expenditure levels or high public debt amounts which can lead to a crisis. There is a significant body of knowledge in the empirical literature on macroeconomic factors, fiscal policy and even on public expenditure. However, there is insufficient evidence on the nexus between fiscal policy stance and public expenditure while considering the mediating influence of macroeconomic factors.

Fiscal policy refers to a toll or measures that governments utilise in controlling the level of public expenditure with an objective of redistributing and reallocating resources and economic stabilization (Tanzi, 2006; Perotti, 2007). Therefore, fiscal stance can be described as the fiscal position taken up by a government – contractionary or expansionary fiscal stance.
Public expenditure generally refers to the expenses incurred by a government in its own maintenance, the society at large or assisting other nations. Public expenditure can be classified into recurrent expenditure and development expenditure (Barro & Grilli, 1994).

In this paper, three macroeconomic factors have been selected from amongst other factors which include inflation rate, unemployment rate and foreign aid and grants. The key reason for studying the three variables is that they have been observed in previous studies (Tanzi, 2006) as having a significant relationship with fiscal policy. Furthermore, there is insufficient evidence on how these macroeconomic factors mediate on the relationship between fiscal stance and public expenditure. Dornbusch et al. (2004) describe macroeconomic factors as indicators of the economic behaviour and policies that affect an economy. Unemployment rate is the fraction of the labour force that is out of work and looking for a job or expecting a recall from a layoff while inflation is the rate of change in the general price level (Dornbusch et al., 2004). Foreign aid and grants constitute the amount of aid and grants sourced from other countries. Generally, studies on macroeconomic factors and public expenditure done by Fan and Rao (2003) and Tayeh and Mustafa (2011) argue that macroeconomic factors in a nation can determine public expenditure levels. This implies that macroeconomic stability would ignite changes in public expenditure.

There is inconclusive evidence on the mediating influence of inflation, unemployment rate and foreign aid and grants on the relationship between fiscal stance and public expenditure in Kenya in the existing finance literature. Hence, this paper seeks to answer the following research questions; what is the effect of fiscal stance on public expenditure in Kenya? Do inflation rate, unemployment rate and foreign aid and grants have a mediating effect on the relationship between fiscal stance and public expenditure in Kenya? This paper is arranged in the following sections; introduction, literature review, research methodology, data analysis and conclusions.

2. Literature Review

2.1 Theoretical Review

This paper is anchored on the following theories; Theory of fiscal policy, Wagner's Law of increasing state activities and Peacock-Wiseman hypothesis. The Theory of fiscal policy states that fiscal policy aims at redistributing income and reallocating resources in addition to achieving stabilization in an economy (Musgrave, 1959; Johansen, 1965). This theory contends that fiscal policy can influence the increase or decrease in public expenditure considering the fiscal priorities present. Tanzi (2006) argues that fiscal policy makers have a key agenda of promoting the social and economic welfare of citizens dependent upon the government in power. Therefore, the theory of fiscal policy underpins the relationship between fiscal policy stance and public expenditure since fiscal policy intends to redistribute and reallocate resources in a nation.

Wagner's Law of increasing state activities is a theory arguing that there is a long run tendency for public expenditure to grow in relation to national income. Wagner (1863) based the theory in Germany, where he noted that all types of governments showed an increasing trend in public expenditure regardless of their size or plans. However, Wagner was not clear on the composition of public expenditure but Musgrave (1959) argued that Wagner's focus could have been on the size of the public sector in the economy as a whole. Wagner's contributions to public expenditure theories is significant considering that before his study the popular notion was that public expenditure had an inverse relationship with economic growth. Therefore, Wagner's Law implicitly underpins the relationship between the selected macroeconomic factors and public expenditure taking into consideration that macroeconomic factors explain the economic behaviour of a nation.

The Peacock-Wiseman hypothesis is a theory stating that public expenditure increases in relation to economic growth in a step-like manner unlike the smooth and continuous pattern as argued by Wagner's Law. Peacock and Wiseman (1961) argued that public expenditure in the UK from 1890 to 1955 had a smooth pattern but seemed to have steep increases especially during war or civil instability but public spending stabilized afterwards. The public expenditure trends are related to tax revenues and it is notable that the tolerable tax burden by the public is stable unless there are cases of economic or political instability. Therefore, this theory underpins the relationship between fiscal policy stance and public expenditure considering that fiscal stance is operationalized by tax and budget deficits.

2.2 Empirical Review

In the finance literature, several studies have been undertaken where they relate macroeconomic factors to economic growth but there is still insufficient evidence on how these macroeconomic factors relate to fiscal policy and public expenditure. For instance, UNCTAD report (2010) using a descriptive research approach examines macroeconomic policy and development during the 2008 global financial crisis (GFC). The paper argues that the popular notion before the GFC was that countries undergoing economic distress should implement prudent measures in the form of tight fiscal policies to achieve macroeconomic stability. Canuto (2009) and Svante (2010) using a descriptive research approach, support the view that in a crisis period and recession, which is characterized by rising unemployment, rising interest rates and a fall in commodity prices, countries should implement contractionary economic policies. However, Brixiova (2010) and UNCTAD (2010) argue that non-restrictive policies are beneficial to all economies inclusive of Africa in order to stimulate aggregate demand in an economy as part of post-crisis recovery.

The fiscal policy adopted by a country would influence the macroeconomic factors and essentially the levels of public expenditure. Perotti (2007) argues that a rise in the interest rate regulated by the monetary authorities would lead to some fall in the output gap and a slowdown in inflation. Fan and Rao (2003) using regression analysis from 1980 to 1998 across 43 developing nations in Asia, Africa and Latin America contend that the macroeconomic reforms of a nation can determine the level of public expenditure in a country. This implies that changes in macroeconomic factors would affect the level of public expenditure as influenced by the fiscal policy adopted by a government.

Studies on the relationship between macroeconomic factors and public expenditure exhibit varied findings. For instance, Njeru (2003) using cointegration approach for the period 1970 to 1999 in Kenya contends that the level of foreign aid would affect the amounts of public expenditure. This means that economies which mainly finance their budgets using a significant amount of debt, the public expenditures in those economies would be affected. Remmer (2004) using time series cross sectional regression analysis from 1970 to 1999 in 120 middle and lower income countries, sought to examine whether foreign aid generates incentives and opportunities for public expenditure growth. The study findings indicate that foreign aid generates incentives for the growth of public expenditure. Similarly, Fan and Rao (2003) investigated the trends and impact of public expenditure in developing countries and found that public debt levels can determine the level of public expenditure.

On the interrelation between unemployment rate and inflation rate on public expenditure, Tayeh and Mustafa (2011) using correlation analysis from 1979 to 2000 in Jordan found that unemployment rates and inflation rates have a significant relationship with public expenditure. The study further argues that a government uses fiscal policy to fight inflation since it would respond by reducing public spending when inflation increases and when the share of unemployment rises, it is inclined to increase public spending. However the study did not extend the modelling to advanced methodologies such as using the error correction model to test the interrelationships among the variables.

Magazzino (2011) using time series data from 1970 to 2009 in the Mediterranean countries found that public expenditure growth and inflation have a long run relation in Portugal. Granger causality tests were also undertaken and the findings indicate that there is bi-directional flow for public expenditure growth and inflation in Italy in the short run, unidirectional flow from inflation to public expenditure in Portugal in the long run, in France a unidirectional flow in the short run but in the opposite direction (from public expenditure to inflation) in Cyprus, Malta and Spain.

Similarly, Ezirim et al. (2008) undertook a study on public expenditure and inflation from 1970 to 2002 using cointegration analysis and Granger causality testing. The study found that public expenditure and inflation are

cointegrated thus implying that they have a long run interrelation. Ayo et al. (2012) indicate that from public expenditure to inflation rate, there exists unidirectional causality. However, there are studies that report a weak relationship between inflation and public expenditure. For instance, Han and Mulligan (2008) using time series data from 1973 to 1990 based on eighty countries indicate that permanently high non-defence public expenditure across countries is weakly related to inflation. Generally the studies on inflation and public expenditure present mixed findings yet they use Granger causality tests to explore these interrelationships. The differences in economic environment such as whether a developed or developing region, whether the data used is time series or cross-sectional or the theoretical underpinning of the study could be some of the reasons that could explain the divergence of results.

There has been extensive literature on budget deficits and their effects on economies. Nevertheless there was a study done by Alesina and Perotti (1994) that sought to examine the institutional determinants of budget deficits. The study contends that budget deficits should only be observed during wars and recessions since those are times when public expenditure is temporarily high. Interestingly the study findings indicate that fiscal illusion by voters due to their ignorance on government budget constraints and asymmetric stabilization policies that entail politicians always willing to run deficits during recessions contribute to the rising levels of budget deficits.

3. Research Methodology

The causal analytical research design was adopted since it enabled the determination of the cause and effect in examining the influence of selected macroeconomic factors on the relationship between fiscal policy stance and public expenditure in Kenya. The study population period was 1964 to 2015 since it captured the universe of these variables in Kenya. Secondary data on fiscal policy, macroeconomic factors (inflation rates, unemployment rates & foreign aid and grants) and public expenditure was collected from Kenya National Bureau of Statistics (KNBS) economic surveys, statistical abstracts and annual budget estimates books.

The data collected was analysed using descriptive and inferential statistics where it involved a description of the data, undertaking of diagnostic tests and finally time series modelling. In establishing the influence of macroeconomic factors on the relationship between fiscal policy stance and public expenditure, three steps were involved in testing the intervening influence according to the Baron and Kenny (1986) approach. The first step involved regressing fiscal policy stance against public expenditure using a VECM model as follows;

$$PExp_t = \propto_{10} + \propto_{11} PExp_{t-1} + \propto_{12} FP_{t-1} + \varepsilon_{1t} \quad \textbf{(1)}$$

Where:
$PExp_t$ = Public Expenditure
$PExp_{t-1}$ = Lagged Public Expenditure
FP_{t-1} = Fiscal Policy Stance
α_{10} = The Constant or Intercept
α_{11} = Model Coefficient of the Lagged Public Expenditure
α_{12} = Model Coefficient of Fiscal Policy Stance
ε_{1t} = Error Term or Structural Shock

The second step involved regressing fiscal policy stance against inflation rate and unemployment rate using VAR models while a VECM model was used in regressing fiscal policy stance against foreign aid & grants as follows;

$$Unemp_t = \propto_{10} + \propto_{11} FP_t + \varepsilon_t \quad \textbf{(2)}$$
$$Infl_t = \propto_{20} + \propto_{21} FP_t + \varepsilon_t \quad \textbf{(3)}$$
$$FGrnt_t = \propto_{30} + \propto_{31} FP_t + \varepsilon_t \quad \textbf{(4)}$$

Where:
$Unemp_t$ = Unemployment Rate
$Infl_t$ = Inflation Rate
$FGrnt_t$ = Foreign Aid and Grants
FP_t = Fiscal Policy Stance
$\alpha_{10}, \alpha_{20}, \alpha_{30}$ = Constant or Intercept
$\alpha_{11}, \alpha_{21}, \alpha_{31}$ = Model Coefficient of Fiscal Stance
ε_t = Error Term or Structural Shock

The final step involved regressing fiscal policy stance and economic growth on public expenditure using a VECM model as follows;

$$Y_t = \beta_0 + \beta_1 Y_{t-1} + \sum_{i=1}^{m} \gamma_i X_{it} + \varepsilon_t \quad \textbf{(5)}$$

Where:
Y_t = Public Expenditure
Y_{t-1} = Lagged Public Expenditure

X_{it} = Independent Variables
β_0 = Constant or Intercept
β_1 = Model Coefficient of the Lagged Public Expenditure
γ_i = Model Coefficients of the Independent Variables
ε_t = Error Term or Structural Shock

4. Data Analysis

4.1 Data Description

Time series annual data was collected from KNBS reports and World Bank Development indicators reports. The data description involves highlighting the annual trends on fiscal policy stance (budget deficit, tax) and public expenditure as indicated in Figures 1 to 3 in the appendix. The annual budget deficits in Kenya as indicated in Figure 1 in the appendix seem to be constant from 1964 to 1990. However, in the 1990s the deficit was volatile implying that there were years with budget surpluses. However, after the year 2000 budget deficit has been on an increasing trend implying the existence of an expansionary fiscal stance. The annual tax revenue as depicted by Figure 2 in the appendix indicates an increasing trend over time but with slumps in the years 1995 and 2005. However, the rate of increase in the tax revenue is lower than that of public expenditure over the years as seen in Figures 2 and 3 in the appendix, which concurs with the finding that the Kenya government has been using an expansionary fiscal stance to spur economic growth. Finally, public expenditure has an increasing smooth trend over the years as indicated in Figure 3 in the appendix thus concurring with Wagner's Law of increasing state activities that public expenditure growth follows a smooth pattern as opposed to the step-like pattern as argued by Peacock-Wiseman hypothesis.

4.2 Summary Statistics

Fiscal policy stance (budget deficit) has a mean of Ksh. 42507.66 million with a standard deviation of Ksh. 100432.6 million as indicated in Table 1. Fiscal policy stance (tax) has a mean of Ksh. 123379.8 million with a standard deviation of Ksh. 196962.8 million. Unemployment, inflation and foreign aid and grants have a mean of 9.51%, 9.95% and Ksh. 6537.43 million respectively. Public expenditure has a mean of Ksh. 192760.3 million with a standard deviation of Ksh. 294372.1 million. Fiscal policy stance, inflation rate, foreign aid and public expenditure have a positive distribution as indicated by the skewness. On kurtosis, the variables are highly peaked relative to the peakedness of a normal distribution with values above three (3) implying that the distribution is leptokurtic.

Table 1: Summary Statistics of the Study Variables

	Budget Deficit (Ksh. M)	**Tax (Ksh. M)**	**Unemployment Rate (%)**	**Inflation Rate (%)**	**Foreign Aid & Grants (Ksh. M)**	**Public Expenditure (Ksh. M)**
Mean	42507.66	123379.8	9.51	9.95	6537.43	192760.3
Median	395.50	30486.6	9.55	9.60	3875.64	53007.75

4.3 Diagnostic Test Results

This paper used the Augmented Dickey-Fuller (ADF) test for stationarity and Johansen test for cointegration in undertaking diagnostic tests. The stationarity tests were undertaken on fiscal policy stance (tax, budget deficit), unemployment rate, inflation rate, foreign aid and grants and public expenditure in order to determine if they are stationary or non-stationary.

Table 2: Results of Stationarity Tests

Variable	**ADF Statistic at Level**	**ADF Statistic at First**	**ADF Statistic at Second**

		Differencing	Differencing
Tax	-0.5459 (0.8728)	-6.9760 (0.0000)	
Budget Deficit	-0.2621 (0.9223)	-0.7274 (0.8293)	-10.7528 (0.0000)
Unemployment Rate	-3.8872 (0.0042)		
Inflation Rate	-5.5615 (0.0000)		
Foreign Aid & Grants	1.1795 (0.9975)	-3.6062 (0.0099)	
Public Expenditure	9.5844 (1.0000)	4.5209 (1.0000)	-16.1278 (0.0000)

Source: Researcher's Computations

In Table 2, the stationarity results indicate that tax and development expenditure are stationary at first differencing which means that they are integrated at order one I(1). On the other hand, budget deficit, recurrent expenditure and public expenditure are stationary at second differencing meaning that they are integrated at order two I(2). Cointegration tests were undertaken in order to test if the variables have a long run relationship between them. The Johansen test for cointegration was conducted using the trace statistic and maximum Eigen values. For cointegration to exist, the trace statistic should be greater than the critical values at 5% level of significance.

Table 3: Results of Johansen Cointegration Test

	Hypothesized No. of CE(s)	Eigen value	Trace Statistic	0.05 Critical Value	Prob.
Budget Deficit & Public Expenditure	None*	0.7121	67.3906	20.2618	0.0000

* denotes rejection of the null hypothesis at the 0.05 level of significance

Source: Researcher's Computations

The results in Table 3 indicate that budget deficit and public expenditure are cointegrated since the trace statistics of 67.3906 is greater than the critical value of 20.2618 at 5% level of significance. Similarly, there is cointegration between tax and public expenditure since the trace statistics is greater than the critical value at 5% level of significance. However, tax seems to have a stronger level of cointegration which is essentially a stronger long-run relationship with public expenditure as compared to budget deficit with public expenditure as evidenced by the number of co-integrating equation results in Table 3. Granger causality tests were undertaken so as to determine if one variable causes another or simply testing the level of prediction of one variable against another. The null hypothesis in the Granger causality test states that a variable x does not Granger cause variable y in the first regression while variable y does not Granger cause variable x in the second regression at 5% level of significance.

Table 4: Results of Granger Causality Tests

Null Hypothesis	f-Statistic	P-values
Tax revenue does not Granger cause public expenditure	0.2904	0.7494
Public expenditure does not Granger cause tax revenue	2.4340	0.0997
Budget deficit does not Granger cause tax revenue	0.4930	0.6142
Tax revenue does not Granger cause budget deficit	1.6651	0.2011
Tax revenue does not Granger cause inflation rate	0.0103	0.9898
Inflation rate does not Granger cause tax revenue	1.5524	0.2234

Budget deficit does not Granger cause inflation rate	0.7747	0.4672
Inflation rate does not Granger cause budget deficit	0.6156	0.5450
Tax revenue does not Granger cause unemployment rate	0.0311	0.9694
Unemployment rate does not Granger cause tax revenue	0.0905	0.9137
Budget deficit does not Granger cause unemployment rate	0.0366	0.9641
Unemployment rate does not Granger cause budget deficit	0.0233	0.9770
Foreign aid & grants does not Granger cause budget deficit	1.5967	0.2143
Budget deficit does not Granger cause foreign aid & grants	0.2880	0.7512

Source: Researcher's Computations

The findings in Table 4 indicate that tax revenue does not Granger-cause public expenditure and vice versa at 5% level of significance as indicated by the *p*-values of 0.7494 and 0.0997. Budget deficit does not Granger-cause tax revenue and vice versa at 5% level of significance as indicated by the p-values of 0.6142 and 0.2011. Foreign aid and grants do not Granger-cause budget deficit and vice versa at 5% level of significance as indicated by the p-values of 0.2143 and 0.7512.

4.4 Model Specification

4.4.1 Fiscal Policy Stance, Selected Macroeconomic Factors and Public Expenditure

The key objective of this paper was to establish the influence of inflation rate, unemployment rate and foreign aid & grants on the relationship between fiscal policy stance and public expenditure in Kenya. Stepwise regression was undertaken where it involved three main steps. The first step entailed regressing fiscal policy stance on public expenditure, the second step involved regressing fiscal policy stance on selected macroeconomic factors while the third step involved regressing fiscal policy stance and selected macroeconomic factors on public expenditure. The three steps were used based on mediation analysis done by Baron and Kenny (1986) and further supported by MacKinnon et al. (2002) on the key steps in establishing if a variable has a mediating or intervening influence on a dependent to independent variable relationship. Furthermore, there can be various forms of intervening effects ranging from full mediation, partial mediation or no mediation. According to Baron and Kenny (1986) full mediation is when the independent to dependent relationship is insignificant but the effect on the dependent variable is significant when the intervening variable is introduced. Partial mediation exists when the independent to dependent relationship is less significant compared to the relationship among the independent variable, intervening variable and the dependent variable. Lastly, no mediation is when the independent to dependent relationship is insignificant and also insignificant effect on the dependent variable when the intervening variable is introduced.

The first step of testing intervening or mediating influence involved fiscal policy stance and public expenditure whereby a VECM model was used. The results are indicated in Table 1A in the appendix, where they indicate that the effect of fiscal policy stance on public expenditure is statistically insignificant. The second step of testing intervening or mediating influence which entailed fiscal policy stance and each of the selected macroeconomic factors (inflation rate, unemployment rate and foreign aid & grants) was established using VAR models and a VECM model as determined by the existence of cointegration between the variables in a model. Pre-diagnostic checking and post diagnostic checking was undertaken.

4.4.2 Fiscal Policy Stance and Inflation Rate

The effect of fiscal policy stance on inflation rate was established using a VAR model. Pre-diagnostic checking and post diagnostic checking was undertaken. Table 5 indicates the lag length criteria/selection method used in testing the effect of fiscal policy stance on inflation rate.

Table 5: Lag Length Selection

Lag	LogL	LR	FPE	AIC	SC	HQ
0	-825.3494	NA	8.79e+11	36.01519	36.13445	36.05987

* indicates lag order selected by the criterion
Significance level at 5%
Source: Researcher's Computations

From Table 5, three (3) lags were selected since under the LR, FPE and AIC the lag value was the lowest. After the lag selection was done, the effect of fiscal policy stance on inflation rate was undertaken. Before running the VAR

model, diagnostic tests were done such as Johansen cointegration test and Stationarity test so as to ensure that the model would generate robust results. The data was tested for Stationarity at level and if it was not stationary then it was made stationary at first differencing or second differencing. For the cointegration tests, there was no cointegration between fiscal policy stance and inflation rate hence a VAR model being the most appropriate model to be used. The VAR model is as shown next in Table 6.

Table 6: VAR Model for Fiscal Policy Stance and Inflation Rate

Equation: INFL = C(1)*INFL(-1) + C(2)*INFL(-2) + C(3)*INFL(-3) + C(4) *TAX(-1) + C(5)*TAX(-2) + C(6)*TAX(-3) + C(7)*BDEFIC(-1) + C(8)*BDEFIC(-2) + C(9)*BDEFIC(-3) + C(10)

From Table 6, the effect of fiscal policy stance on inflation rate is statistically insignificant as indicated in the p-values except the two lagged variable of inflation with a *p*-value of 0.0461 at 5% level of significance. The R^2 is 20.73% meaning that 20.73% of the variations in inflation can be explained by fiscal policy stance. The joint significance between budget deficit and inflation rate was tested using the Wald test as indicated next.

Table 7: Joint Significance between Budget Deficit and Inflation Rate

Test Statistic	Value	df	Probability
Chi-square	1.824088	3	0.6097

Null Hypothesis: C(7)=C(8)=C(9)=0
Null Hypothesis Summary:

Normalized Restriction (= 0)	Value	Std. Err.
C(7)	4.25E-05	4.66E-05
C(8)	-8.49E-05	6.55E-05
C(9)	3.92E-05	6.00E-05

Source: Researcher's Computations

From the Table 7, we accept the null hypothesis that budget deficit and its lagged variables cannot jointly influence inflation rate as indicated by the *p*-value of 0.6097.

Table 8: Joint Significance between Budget Deficit and Tax

Test Statistic	Value	df	Probability
Chi-square	3.872157	3	0.2756

Null Hypothesis: C(17)=C(18)=C(19)=0
Null Hypothesis Summary:

Normalized Restriction (= 0)	Value	Std. Err.
C(17)	-1.41E-06	1.15E-06
C(18)	-2.06E-07	1.62E-06
C(19)	2.33E-06	1.49E-06

Source: Researcher's Computations

As indicated in Table 8, we accept the null hypothesis that budget deficit and its lagged variables cannot jointly influence tax as indicated by the *p*-value of 0.2756.

Table 9: Joint Significance between Tax and Budget Deficit

Test Statistic	Value	Df	Probability
Chi-square	8.684858	3	0.0338

Null Hypothesis: C(24)=C(25)=C(26)=0
Null Hypothesis Summary:

C(24)	14754.16	20391.02
C(25)	19467.77	28819.27
C(26)	-28788.12	18780.42

Source: Researcher's Computations

From the Table 9, we reject the null hypothesis that tax and its lagged variables cannot jointly influence budget deficit as indicated by the *p*-value of 0.0338. Therefore there is joint significance between tax and budget deficit. Table 10 indicates the serial correlation test undertaken so as to determine if there was any autocorrelation between the variables after running the model.

Table 10: Serial Correlation Test
Breusch-Godfrey Serial Correlation LM Test:

F-statistic	2.623811	Prob. F(3,34)	0.0663
Obs*R-squared	8.835556	Prob. Chi-Square(3)	0.0316

Source: Researcher's Computations

There is serial correlation in the model as indicated by the *p*-value of 0.0316 while the corresponding R^2 is 8.835556. Table 11 shows the results of the heteroscedasticity test done in order to determine if there was heteroscedasticity between the variables after running the model.

Table 11: Heteroscedasticity Test

Heteroskedasticity Test: Breusch-Pagan-Godfrey

F-statistic	1.652829	Prob. F(9,37)	0.1363
Obs*R-squared	13.47741	Prob. Chi-Square(9)	0.1422
Scaled explained SS	8.002532	Prob. Chi-Square(9)	0.5339

Source: Researcher's Computations

We accept the null hypothesis that states that there is no heteroscedasticity as indicated by the *p*-value of 0.1422 at 5% level of significance while the corresponding R^2 is 13.47741.

4.4.3 Fiscal Policy Stance and Unemployment Rate

The effect of fiscal policy stance on unemployment rate was established using a VAR model. Pre-diagnostic checking and post diagnostic checking was undertaken. Table 12 shows the lag length criteria/selection method used in testing the effect of fiscal policy stance on unemployment rate.

Table 12: Lag Length Selection

Lag	LogL	LR	FPE	AIC	SC	HQ
0	-746.1435	NA	2.81e+10	32.57146	32.69072	32.61613

* indicates lag order selected by the criterion
Significance level at 5%

Source: Researcher's Computations

From the Table 12, one (1) lag was selected since under the FPE, AIC, SC and HQ the lag value was the lowest. After the lag selection was done, the effect of fiscal policy stance on unemployment rate was undertaken. Before running the VAR model, diagnostic tests were done such as the Johansen cointegration test and Stationarity tests so as to ensure that the model would generate robust results. The data was tested for Stationarity at level and if it was not stationary then it was made stationary at first differencing or second differencing. For the cointegration tests, there was no cointegration between fiscal policy stance and unemployment rate hence a VAR model being the most appropriate model to be used. The VAR model is as shown in Table 13.

Table 13: VAR Model for Fiscal Policy Stance and Unemployment Rate

Equation: UNEMP = C(1)*UNEMP(-1) + C(2)*LNTAX(-1) + C(3)*BDEFIC(-1) + C(4)

F-statistic	5.624927	Durbin-Watson stat	2.250381
Prob(F-statistic)	0.002315		

Source: Researcher's Computations

From Table 13, the effect of fiscal policy stance on unemployment rate is statistically insignificant as indicated in the *p*-values except the lagged variable of unemployment with a *p*-value of 0.0002 at 5% level of significance. The R^2 is 27.27% meaning that 27.27% of the variations in unemployment can be explained by fiscal policy stance. The joint significance between budget deficit and unemployment rate was tested using the Wald test as indicated next.

As indicated in Table 19, we reject the null hypothesis that states that there is no heteroscedasticity as indicated by the *p*-value of 0.0031 at 5% level of significance while the corresponding R^2 is 13.89273.

4.4.4 Fiscal Policy Stance and Foreign Aid & Grants
The effect of fiscal policy stance on foreign aid & grants was also established using a VECM model and pre-diagnostic checking and post diagnostic checking was undertaken. Table 20 shows the lag length criteria/selection method used.

Table 20: Lag Length Selection

Lag	LogL	LR	FPE	AIC	SC	HQ
0	-726.7147	NA	1.21e+10	31.72673	31.84599	31.77140

* indicates lag order selected by the criterion
Significance level at 5%

Source: Researcher's Computations

From the Table 20, one (1) lag was selected since under the FPE, AIC, SC and HQ the lag value was the lowest. After the lag selection was done, the effect of fiscal policy stance on foreign aid & grants was undertaken. A VECM model was used to test the hypothesis. Before running the VECM model, diagnostic tests were done such as Johansen cointegration test and Stationarity test so as to ensure that the model would generate robust results. The data was tested for Stationarity at level and if it was not stationary then it was made stationary at first differencing or second differencing. For the cointegration tests, there was cointegration between fiscal policy stance and foreign aid & grants hence a VECM model being the most appropriate model to be used. The VECM model is as shown next;

Table 21: VECM Model for Fiscal Policy Stance and Foreign Aid & Grants

D(FAID) = C(1)*(FAID(-1) - 1.57215141671*TAX(-1) + 6.50736179382E-06*BDEFIC(-1) + 8.97000160415) + C(2) *D(FAID(-1))

From Table 27, the effect of fiscal policy stance and macroeconomic factors on public expenditure is statistically significant as indicated in the *p*-values while the R^2 is 78.34% meaning that 78.34% of the variations in public expenditure can be explained by fiscal policy stance and the macroeconomic factors. As indicated in Table 27 fiscal policy stance (budget deficit), foreign aid & grants and the lagged variable of public expenditure have a significant effect on public expenditure. The *p*-value of C(1) or the constant is 0.0000 meaning that there is a long run causality running from fiscal policy stance and macroeconomic factors to public expenditure. The f-statistic is 0.000000 meaning that the model fits the data well. Short run causality was also tested using the Wald test as indicated in Tables 28, 29, 30, 31 and 32.

Table 28: Wald Test for Tax on Public Expenditure

Source: Researcher's Computations

From the Table 33, we accept the null hypothesis that there is no serial correlation in the series residual as indicated by the *p*-value of 0.3577. Heteroscedasticity test was done in order to determine if there was heteroscedasticity between the variables after running the model as indicated in Table 34.

Table 34: Heteroscedasticity Test
Heteroskedasticity Test: Breusch-Pagan-Godfrey

F-statistic	1.290103	Prob. F(12,35)	0.2675
Obs*R-squared	14.72031	Prob. Chi-Square(12)	0.2571
Scaled explained SS	46.13026	Prob. Chi-Square(12)	0.0000

Source: Researcher's Computations

Table 34 results indicate that we accept the null hypothesis that states there is no heteroscedasticity as indicated by the *p*-value of 0.2571 at 5% level of significance while the corresponding R^2 is 14.72031.

The final step of testing the intervening influence which involves regressing fiscal policy stance and macroeconomic factors on public expenditure using a VECM model is indicated in Table 27. The results show that fiscal policy stance and foreign aid & grants have a significant influence on public expenditure. Therefore, foreign aid & grants as one of the macroeconomic factors has a mediating/intervening influence on the relationship between fiscal policy stance and public expenditure.

Table 35 shown next gives a summary of the model coefficients before and after the intervening variable is introduced as also indicated in Table 1A (in the appendix) and Table 27 respectively. Also the percentage change as a result of the intervening variable which is macroeconomic factors is also indicated.

Table 35: Intervening Influence of Macroeconomic Factors on Fiscal Stance and Public Expenditure

Variables		**Coefficients without intervening variable**	**Coefficients with intervening variable**	**% Change in the coefficients**
Fiscal Policy Stance	Tax(-1)	-0.0038	27691.44	100%
	Tax(-2)	-0.1580		
	Budget Deficit (-1)	-0.00000141	-0.4787	99.99%
	Budget Deficit (-2)	0.0000000587		
Macroeconomic	Inflation (-1)		-633.44	

Factors	Unemployment (-1)		3182.39	
	Foreign Aid & Grants (-1)		1.775	

Source: Researcher's Computations

As indicated in Table 35, there is a significant change in the model coefficients after the intervening variable (macroeconomic factors) is introduced in the relationship between fiscal policy stance and public expenditure. The percentage changes are approximately 100%.

In the final step of testing intervening influence which involves regressing fiscal policy stance and macroeconomic factors on public expenditure using a VECM model, the results indicate that the lagged variable of public expenditure, fiscal policy stance (budget deficit) and foreign aid & grants have a significant influence on public expenditure. However, the model results in step one and two are statistically insignificant. This means that foreign aid and grants as a macroeconomic factor has a mediating influence on the relationship between fiscal policy stance and public expenditure.

5. Conclusion

First, fiscal policy stance has a weak effect on each individual macroeconomic variable. This implies that there could be several other variables that could explain a more significant effect on each of the macroeconomic variables other than fiscal policy stance. Secondly, the direct effect of fiscal policy stance on macroeconomic factors has not been widely examined. For instance, Canuto (2009) and Svante (2010) argued that during a worsening macroeconomic environment such as increased level of unemployment, then countries should adopt restrictive fiscal policies yet these studies do not clearly show how fiscal policy would influence a particular set of macroeconomic factors. Thirdly, this study contributes to the finance literature by examining the relationship between fiscal policy stance and macroeconomic factors which is a relationship insufficiently explored in empirical literature. Finally, from the study findings foreign aid and grants have an intervening influence on the relationship between fiscal policy stance and public expenditure in Kenya.

Individual Factors And E-Learning Implementation In Higher Education Institutions: A Case Of Kenyan Universities

Harrison Njoroge, David Nzuki and George Kosimbei

Abstract
Individual factors have been known to influence e-learning implementation in institutions of Higher Education. Although studies have been done on factors which influence e-learning implementation in High Education, little has been done in our Kenyan universities to investigate how individual factors could influence e-learning implementation. This study was done to determine how individual factors influence e-learning implementation in Kenyan universities. The research study adopted the cross-sectional descriptive survey design approach. Purposive sampling was used to select 31 universities in Kenya. A self-completion questionnaire was prepared and administered to 165 respondents. These staff included the e-learning administrators and Technicians. Ninety-five (95) filled responses were received from the respondents. The data was analyzed using descriptive and inferential statistics while a multiple regression model was used to predict the effects of the influence of the individual factors. Unified Theory of Acceptance and Use of Technology was utilized in this study to determine the influence under study. The results of the analysis showed that individual adoption factors was an important determinant (p= 0.014) of e-learning implementation. The study revealed that individual factors, namely (basic training on e-learning, motivation of the staff and hiring of competent and trained staff) are key components in the e-learning implementation. The findings of this study, apart from being a source of literature for future studies can be used to guide university managers and other stakeholders on what and where to lay the necessary emphasis to make e-learning a success in their institutions.

Key words: ***Individual factors, e-learning, implementation, adoption***

ISBN 978-9966-132-53-6 @ Copy Right .2019

Introduction

Individual factors in the context of this study referred to the issues and characteristics that would influence the students and instructors thereby making them adapt and use technology in the learning and teaching. The studied factors included educational level, gender, educational experience and training in the e-learning systems, motivation and IT competence. The purpose of e-learning programs in any higher education institutions is to meet the objectives of learning. These objectives touch on the environment in which the learning happens, technology used to do the teaching and learning, student's ability to learn using the e-learning systems and the faculty involved. If the implementation was to succeed, then several factors as identified by (Buabeng-Andoh Charles 2012) play a big role in determining if the individual would adopt and integrate ICT in the teaching and learning. The individual factors reflects on the individual characteristics of motivation, commitments towards the adoption and integration of the technology. Also the instructor plays a role in the effectiveness and success of e-learning based on the courses they prepare for the students (Selim, 2007). The instructor's attitude, competence in technology, teaching style and mind-set were some key characteristics of the instructor identified in a study by (Webster and Hackley, 1997). Similarly, the individual's attitude and prior interaction with a computer could contribute to the success of e-learning adoption.

However, the many pedagogical and socio-economics issues existing in the universities were responsible for users adopting the e-learning technologies. These issues included; the need to access information, the need to communicate via electronic facilities, synchronous learning, increased cooperation and collaboration, cost-effectiveness and pedagogical improvement through simulations, virtual experiences, and graphic representations (**Sife *et al.*, 2007)**. In a study by Afshari *et al.*, (2013), which reviewed literature as pertains to the factors that affect effective implementation of e-learning for instructors and students in educational institutions in Malaysia. The study found out that individual factors affect e-learning practices in schools. Further, e-learning practice needed a good ICT infrastructure and active and collaborative involvement of a number of other people. The study further established that access to the technologies and pedagogical issues and institutional (organizational) support services are important in a successful e-learning practice. The study further concurred that, both the students and faculty were normally willing to use e-learning technology as long as it facilitated their teaching and learning anywhere and anytime on their own. Also the technology was constantly available and accessible for their use.

Buabeng-Andoh Charles (2012) in yet another study identified the factors that encourage teachers to use computer technology in the teaching and learning, in Ghana and concluded that individual or what the study called personal factors played a significant role in determining the influence of the adoption of the technology by the individual. In yet another study, Hew and Brush, (2007); Keengwe and Onchwari, (2008) identified these key factors as; the faculty

attitude and beliefs towards technology. Current study supports the fact that if the faculty attitude is positive towards the e-learning technology, then the faculty will support and use the teaching and learning technology comfortably and willingly. Also, the faculty will advocate for the adoption and integration of the technology in the teaching and learning processes and for use by their students. Also the benefits of the integration of the technology will be realized in the form of improved performance comparable to the traditional mode of teaching and learning (Al-kaabi & Al-muftah, 2011).

Further, for the individual users to be motivated to use e-learning effectively, training and workshops are needed not only to improve the skills of the instructors, but also as a means of getting them involved in the process of implementing and integrating ICTs in teaching and learning. For example, faculty staff requires training not just in the choice and use of appropriate technologies, but more fundamentally in how people learn and design instruction. A previous study by Afshari *et al*., (2013) rooted for training and agreed with the fact that teachers and students' competency in using new technologies, their attitudes towards e-learning systems and their personality traits played an important role in the successful implementation of e-learning program.

Studies done in other parts of the globe acknowledged that faculty that was trained and technically competent had the skill and experience needed in the e-learning and normally encouraged their students to use e-learning (Holden, 2011). Nchunge *et al*., (2012) in their study of the user's perception on the ICT adoption supported faculty training. The authors proposed the organization of computer training sessions, workshops and conferences for the faculty.
This study was interested in establishing the individual factors influences on adoption of e-learning in the Kenyan HEI's. To do this, the study looked at the characteristics of the individual participants, that is, the students and instructors in the HEI's. This involved studying their characteristics that make them adopt and use technology in the teaching and learning. Characteristics of interest in the study included educational level, gender, educational experience, and experience with the computer for educational purpose and attitude towards computers (Buabeng-Andoh Charles, 2012, among others. Further, e-learning training, motivation and IT competence were some of the key factors included in this study of influence of individual factors in the adoption of e-learning.

For e-learning to effectively happen, investment in internet technology must be present. Globally internet users are in the ranges of approximately 4.3 billion users (Internetworldstats, 2017). Of these users, approximately 433 Million are in Africa. Kenya in terms of internet users is ranked number three after Nigeria and Egypt respectively with an approximate population of 43 million internet users as of December 2017. These availability of the internet coupled with acquisition of computers aids in the need for adoption of e-learning for those willing to learn. This can also be a

solution to the problem of overcrowding in the lecture halls, housing the students and transportation (Abdel-Wahab, A., (2008).

Methodology

The research study adopted a cross-sectional descriptive survey design that provided the basis for examining the influence of adoption factors on the implementation of e-learning in the Kenyan universities as perceived by those manning the e-learning section or department. The choice of the research design was driven by the fact that, the approach involved the collection of data through multiple sources such as verbal reports, distribution of questionnaires and personal interviews. In addition, descriptive survey design incorporates the use of both qualitative and quantitative approaches to data collection, analyses and reporting. An advantage of the descriptive survey design method is that it allowed collection of quantitative data from any sizeable population in an economical way. The data collected using this approach, helped to suggest the relationship between variables. The descriptive survey design gave the researcher more control over the research process and the samplings generated findings that were representative of the whole population.

The target population of the current study was chosen from both public and private universities in Kenya, provided the university that they worked for met the criteria of offering e-learning mode. Specifically it comprised the Directors, Deans, Coordinators, Technicians and Administrators in the e-learning section or department in that particular university. As of June 2015, Kenya had 71 universities categorized as both private and public universities recognized and authorized by the Commission for University Education (CUE). Therefore, in the current study the targeted populations were 355 respondents working in the e-learning units in the universities. The universities chosen for this study are connected to the outside world through Kenya Data Network (KENET) fiber optical cable which runs across most institutions of higher learning in Kenya (KENET, 2009). Further, this connection enabled most of the higher learning institutions to share available resources.

The sample size of the study was 165 respondents sampled from thirty three universities. This group was identified because they played a key role in the implementation of the e-learning mode and its success in the university. They were also expected to be competent and well informed on all issues relating to e-learning in their universities. For this study, the number of universities that advertised themselves as having/offering e-learning are 16 public and 17 private. These universities also indicated they offered some of their programs through e-learning or distance education. This information was obtained from their respective websites. The main consideration was a confirmation from the university that they had e-learning programs or well-established Open Distance and E-learning directorates or departments (centers), (Nyerere, *et al*., 2012).

RESULTS AND DISCUSSIONS

E-learning System Training

From responses received back, fifty nine per cent (59%) respondents agreed that basic e-learning training was offered in their institutions while forty one per cent (41%) disagreed that there was any training offered. These findings were in line with those of (Fathema & Sutton, 2013) who reported in their findings that training faculty members was important. The respondents proposed faculty members be offered extensive training, workshops and awareness programs on LMS features, usage and benefits to help increase the faculty use of LMSs. Also a well-trained faculty was confident and motivated to use technology in their teaching and learning and impart the same to their students.

In regard to the e-learning training offered, twenty six per cent (26%) of the respondents indicated that basic training was offered for a period of less than a week. Fourteen per cent (14%) of the respondents indicated that training offered was for one week. About ten per cent (10%) of the respondents indicated that the training was offered for a period of two weeks. Another eight per cent (8%) of the respondents indicated that training was offered for duration of more than two weeks. Finally about forty two per cent (42%) of the respondents indicated that there was no basic e-learning training offered in their institution. These finding were in support of those of previous studies on e-learning technology adoption in the universities which indicated that training of the individual learners and faculty is a requirement for the adoption of the technology to succeed (Soydal, 2012). Further, training period can vary depending on the caliber of users intended to be trained.

Sixty eight per cent (68%) of the respondents agreed that there existed support staff, while thirty two per cent (32%) answered in the negative. Support staffs were required since the failure of the technology could cause interruptions in the studies of the individual students (Ali, Haolader & Muhammad, 2013). Also regular repairs were necessary if ICT was to make a mark in the teaching and learning, hence qualified and trained technical staffs and faculty required (Oye *et al*., 2011) to support e-learning. The top management was also expected to give the moral, financial and material support necessary for the success of the teaching and learning technology that was much needed by the universities for purpose of addressing the high demand for higher education.

ISBN 978-9966-132-53-6 @ Copy Right .2019

Regarding the motivation of users arising from being trained in the use of the e-learning LMS, sixty per cent (60 %) of the respondents agreed that the system motivated the users. About forty per cent (40%) disagreed that users got motivated. The findings in the current study were in line with those of Shimada, (2017) in which the Japanese EFL learners' attitude towards textbooks and web based materials in a blended learning context was studied. The findings indicated, that a simpler e-learning interface designs can motivate users. However despite the interface having such characteristics the satisfaction with material and course content was paramount for overall motivation of the LMS user. Additionally, motivation of the user depends on how the e-learning content meets the needs of the particular user.

Accessibility and Policy of the E-Learning System

When the respondents were asked about the accessibility of the system, sixty per cent (60%) indicated that the access time was less than thirty seconds. Another nine percent indicated that the access time is less than sixty seconds but greater than thirty seconds. Another sixteen per cent (16%) of the respondents indicated that it takes between sixty and ninety second to access and finally the last fifteen per cent (15%) of the respondents indicated it takes more than ninety seconds to access the e-learning systems. This indicated that the e-learning system was easily accessible and reliable for use by the students whenever needed.

According to Gamdi & Samarji, (2016), policies on internet accessibility were needed and should be formulated if e-learning in the HEIs is to be successful. These policies were to ensure that high speed internet access and reliable network were constantly available in the HEIs. However, internet speeds were determined by several factors which included; amount of bandwidth available, number of users within the network, type of connectivity, equipment being used and technical support available among others. This meant that accessibility of the internet needed a well-coordinated approach.

Faculty's E-Learning Capacity

From the findings obtained, sixty six per cent (66%) of the respondents agreed that there existed a well-trained faculty in the universities, while thirty four per cent (34%) disagreed. These findings were in line with those of Imonikhe (2012), which pointed out that if faculty is highly proficient in ICT and embraced online teaching then the students would effectively learn conveniently online. This would ensure teaching and learning is not restricted to classroom walls hence it would lead to a greater access to higher education and admission would no longer be limited to availability of physical facilities such as lecture halls, hall of residence and laboratories within the university.

Multiple Regression Estimates Associated With Individual Factors

Table 1 shows the results of the multiple regression estimates of the coefficients associated with the first objective and which was to determine the extent to which individual factors influenced e-learning implementation in the Kenyan universities.

Table 1: Multiple Regression Estimates Associated with the Individual Factors

	B	Std. Error	Beta	t	Sig.
(Constant)	4.296**	0.578		7.43	0.00
Basic E-learning training	0.556**	0.211	0.267	2.635	0.01
Motivation due to training	0.271	0.223	0.13	1.216	0.227
Existence of well-trained faculty	0.191	0.234	0.088	0.817	0.416
N = 95	Durbin Watson statistic = 2.437	F= 3.050; 0.032		R^2 = 0.62	

** Significant at 0.01

Source: (Author, 2017)

The results from the multiple regression model associated with individual factors show that motivation due to training and existence of well-trained faculty were not significant at 10% level (p=0.227 & 0.416 respectively). This implied that E-learning implementation did not depend on these variables when all were simultaneously included together with others. Hence they ceased to be important in presence of other significant variables like basic E-learning training. This suggested that E-learning implementation depended on this significant variable. The overall multiple regression was statistically significant (P=0.032) and the model explained up to 62% (R-squared) of the variability in the response. This characteristic implied that when users had been offered relevant basic training on e-learning, they were able to use e-learning in their teaching and learning. This was in agreement with the findings by Chokri (2012) that students' positive opinion on use of e-learning technology could be influenced by the expertise of the learners in ICT and the ease of use of the e-learning platform. Both of which could be as a result of training on e-learning. The Durbin-Watson statistic (2.437) showed no autocorrelation in the residuals.

In terms of the significance of the individual factors influencing the implementation of e-learning in Kenyan universities, the study revealed that basic training, duration of the training, availability of trained e-learning support staff, accessibility of the e-learning system and the faculty's e-learning system did significantly influence the implementation of e-learning. These factors were noted to have a significantly high response rate of approximately sixty per cent (60%) or above except for the training duration. The response rate for the training duration was based

on a range. About fifty eight per cent (58%) of the respondents on training duration indicated that it was necessary to be offered, though duration of the training varied. These factors revealed that individual factors significantly influenced e-learning implementation.

Conclusions

As regards the individual factors, basic computer training, availability of trained support staff, accessibility of the e-learning system and the faculty's capacity on e-learning were necessary. However, motivation arising from e-learning training and availability of well-trained faculty were not a must for students enrolled in the e-learning programs. This was because learning was not teacher centered but learner centered, whereby the learner was expected to do most of the learning away from the institution and independently.

Existing literature on e-learning showed a strong adoption and prolific use of e-learning with improved academic performance in higher institutions especially in the developed countries, the same cannot be said for the Kenyan universities. This study was significant in new insight into what and how the mentioned factors could influence the e-learning implementation in the universities. Other researchers, scholars and stakeholders interested in the implementation of e-learning can refer to it. Secondly, the findings in this study can be used to guide university managers and other stakeholders on what and where to lay the necessary emphasis to make e-learning a success in their institutions.

The study recommended that basic computer and LMS training be offered to all new students who register for the e-learning program. The duration for the training can then be varied depending on the basic knowledge these students possess on ICT. Also the training curriculum can include basic computer literacy and LMS training for all faculty and students and should be made compulsory. This will lead to an improved computer literacy and enhance computer self-efficacy hence reducing computer anxiety among the new students at the beginning. It will also enhance ease of use. In return, this will all lead to increased e-learning adoption by both the learners and faculty.

Influence Of The Kenya Constitution On Revenue Allocation Formula In Kenya

Jared Abongo Onyango, PhD

The Technical University of Kenya

Abstract

Federations distribute expenditure responsibility and public service delivery to sub-national levels of government, but each country's approach is influenced by historical, cultural, institutional factors, and legal-judicial interpretations. These are usually anchored in the country's Constitution. The new Constitution of Kenya adopted in August 2010, although does not mention the word federal, established two orders of government; a national government and 47 counties which are guaranteed by the constitution. This paper intends to establish the constitutional guide in the revenue allocation formula in Kenya. The study adopted a cross sectional survey research design. A survey was considered most appropriate in establishing characteristics and relationships between key variables and in facilitating collection of relevant information whose results can be generalised to a defined larger population. The population of this study consisted of the 47 counties established by the Kenya constitution 2010. A sample size of nine (9) counties representing 19.15% of the total population was used. The study used cluster random sampling technique to provide a fair representation of the county governments. The data was analysed using Descriptive statistics, Principle

Component Analysis, Analysis of variance and Communality Analysis. This study established the adequacy of each of the parameters used by the CRA in their formula.

Key Words: ***Federations, Constitution, Revenue Allocation, Devolution, Fiscal Responsibility, Regimes.***

INTRODUCTION

Revenue allocation in the post independent Kenya can be traced from 1963 when Kenya attained independence. During President Kenyatta era (1963–1978), the country's broad development environment was governed by a development blueprint contained in the *Sessional Paper No. 10 of 1965.* This provided a strategy that involved concentrating the small national investment capacity in the areas with the greatest absorptive capacity, with mere surpluses being directed to marginalized areas (ROK, 1965).

Another significant moment in the Kenyatta years was the release of the Public Service Structure and Remuneration Commission report in 1971 – popularly known as the Ndegwa Report (ROK, 1971) – which sanctioned public officers' participation in private business, potentially undermining integrity over their management of state resources. The report implicitly permitted – or at least facilitated – the award of government contracts under serving officers' stewardship to their own companies. Halfway through his tenure in 1971, Kenyatta introduced the Special Rural Development Programme (SRDP), which was launched in only 5 of the 15 arid and semi-arid districts originally targeted (Ergas, 1982). Weak government support was evident in the poor implementation of an initiative characterized by excessive donor dependence, which in turn undermined grassroots participation. Nonetheless valuable lessons were learnt (although not necessarily optimized) about integrating agriculture strategies with rural development strategies (such as in the rural works programmes).

The dynamics of inequalities during the Moi years (1978–2002) were different from those of the Kenyatta years in significant ways, even though the second president fundamentally followed his predecessor's footsteps. During his years in office, poverty in Kenya reached its highest levels since independence. While his mid-1980s District Focus for Rural Development (DFRD) planning strategy could have focused the spotlight on grassroots development bottlenecks, its full implementation would have taken attention away from a highly narcissistic individual whose exploits typically accounted for more than half the news broadcasts on the monopoly national broadcaster.

Kibaki's tenure (2003-2013) saw extensive economic revival, based on growth in tourism, construction, roads and telecommunications sectors. But this revival has barely diminished poverty and regional inequalities, both of which have traditionally driven demands for devolution. GDP growth rose from 2.9 per cent (2003) to 7 per cent (2007), and per capita income declined to Ksh31,900 in the years to 2003, then rose to Ksh36,000 by 2007 (KIPPRA, 2009). However, this did not end well with the 2008post election violence which watered down the gains made in NARC's first term in office.

Kenya's 1963 Constitution did not provide for revenue sharing between national and subnational governments, a situation that led to under-provisioning at these lower levels of government, affecting their service delivery. This position has been reversed in the new Constitution, which entrenches fiscal devolution that provides for sharing of both the revenue base and the nationally collected revenues.

RESEARCH METHODOLOGY

The study used cross sectional survey study. The design enabled the researcher to collect data using questionnaires. Interview was also conducted face to face with county government officers to collect data. The study adopted the

causal survey research because the data gathered was quantitative and qualitative in nature as well as pre-planned and structured. This helped in attempting to explain the cause and effect relationship between the constitutional influence and the revenue allocation formula. In the end this design helped to understand which variables were the cause and which variables were the effects. It also helped to determine the nature of relationship between the causal variables and the effect predicted. In their studies Sergio (2001), GAO (2001), Moore (2011), Spencer (2012), Rossi and Dafflon (2012) used the causal survey research method to determine the effects of parameters in revenue allocation and also calculate the indices used in determining parameter weights.

LITERATURE REVIEW

Kenya's counties enjoy a constitutional guarantee that at least 15 percent of national revenue will be handed over unconditionally, but the definition of the base has not always been clearly agreed upon (ROK, 2010). First, the definition of the universe of national revenues was initially the subject of some debate. Second, although the Constitution is clear that the formula will be applied to the last audited set of accounts, the implied lag in base years does not appear to be always well understood in policy circles (and much less the media or the public who understand the 15 percent as applying to the current year's budget). The ultimate definition of the base may not matter so much, although some choices appear more rational. To the extent that the CRA has the ability to recommend any percentage for the unconditional equitable share above the ceiling of 15 percent, it has the flexibility to determine what combination of base and rate corresponds to the targeted level of unconditional transfer. The CRA Act, currently the only legal definition of the base, appears sensible to the extent that it includes the main sources of revenue (tax and non-tax revenues), but excludes donor funding, appropriations in aid, domestic borrowing and 'revenues' linked to dedicated funding schemes (such as RLMF and LATF). Because the equitable share is guaranteed in terms of a percentage (and not an amount), including highly volatile elements in the base (such as domestic borrowing or donor funding) that would be detrimental to the predictability of transfers to counties. Moreover, it would make little sense to re-channel to counties on an unconditional basis, funds that are collected (internally or externally) with specific purposes in mind, such as donor funds or earmarked funds such as RMLF or LATF (ROK, 2012).

The Constitutional provisions on how to calculate the revenue base for the equitable share, referred to as 'national revenue', have caused some confusion because it is not entirely clear which revenues should be included. In particular: Article 202(1) refers to *"revenue raised nationally"* (the phrasing here implies a consideration for revenues raised in the whole nation rather than by one level of government). Article 203 refers to *"all revenue collected by the national government"* (this might be interpreted to include donor funds, funds from domestic borrowing and AIAs). Article 206 describes the money that should go into the consolidated fund as *"all money raised or received by or on behalf of the national government"* (again this might be interpreted to include donor funds, funds from domestic borrowing and AIAs) (ROK, 2010).

During 2011 this ambiguity was exacerbated when two alternative definitions of national revenue were put forward in the Commission on Revenue Allocation (CRA) Act and the Intergovernmental Fiscal Relations Bill. The latter has now been dropped and the definition included in the CRA Act (Section 2(1)) is now accepted, namely that: *"'revenue' means all taxes imposed by the national government under Article 209 of the Constitution and any other revenue (including investment income) that may be authorized by an Act of Parliament, but excludes revenues referred to under Articles 209(4) and 206(1)(a)(b) of the Constitution."*(ROK, 2011)

The revenues excluded from the CRA Act definition referred to in Article 209(4) relate to fees and charges of national and county governments for services and those in Article 206(1) relate to money excluded from the Consolidated Fund by an Act of Parliament and payable into another public fund.

Article 201 of the Constitution sets the following principles to guide all aspects of public finance in the Republic (a) there shall be openness and accountability, including public participation in financial matters; (b) the public finance system shall promote an equitable society, and in particular, (i) the burden of taxation shall be shared fairly, (ii) revenue raised nationally shall be shared equitably among national and county governments; and (iii) expenditure shall promote the equitable development of the country, including by making special provision for marginalized groups and areas; (c) the burdens and benefits of the use of resources and public borrowing shall be shared equitably between present and future generations; (d) public money shall be used in a prudent and responsible way; and (e) financial management shall be responsible, and fiscal reporting shall be clear (ROK, 2010).

RESULTS AND INTERPRETATIONS

The study sought to establish the influence of the constitution on revenue allocation in Kenya, most of the respondents agreed that minimum revenue allocation to county governments of 15% of all revenue collected nationally is sufficient as provided for by the Kenya Constitution 2010 (58.33%), the mandate/powers conferred on the Commission for Revenue Allocation in revenue allocation are sufficient (39.04%), The County revenue taxes are adequate in running county governments (22.37%), Marginalized areas are adequately catered for by the current constitution (38.59%), The role of the senate in revenue allocation is sufficiently provided for in the constitution (38.16%), Equalization fund is sufficiently addressed by the constitution (42.98%). The results of the respondents are presented in Table 4.29.

Table 4.31: Constitutional Influence Statistics

	Agree Percent (%)	Neutral Percent (%)	Disagree Percent (%)
The minimum Revenue allocation to county governments of 15% of the GDP is sufficient.	58.33	12.72	28.95
The mandate/powers conferred on the Commission for Revenue Allocation in revenue allocation are sufficient	39.04	28.07	32.89
County revenue taxes are adequate in running county governments	22.37	21.93	55.70
Marginalized areas are adequately catered for by the current constitution	38.59	28.95	32.46
The role of the senate in revenue allocation is sufficiently provided for in the constitution	38.16	26.75	35.09
Equalization fund is sufficiently addressed by the constitution	42.98	30.70	26.32

Weighted Mean Statistics for Constitutional Influence on Revenue Allocation

The mean and standard deviations for constitutional influence on revenue allocation are indicated in table 4.31. As discussed in chapter three the mean range used in the study is 0 to 5 inclusive. The mean obtained for the findings are between 2 and 3. The scale 2 is valid extent and 3 moderate. We can conclude the findings are valid since the means of the data obtained are within acceptable range.

The standard deviation is used to measure how concentrated the data are around the mean. The more concentrated the data, the smaller the standard deviation. A small standard deviation means that the values in a statistical data set are close to the mean of the data set. The findings as shown in table 4.31 indicate that all the standard deviations are close to 1 for all the data findings. This implies all the data sets are concentrated around the mean scores hence valid for interpretations.

Table 4.32: Weighted Means Constitution

	N	**Mean**		**Std. Deviation**
		Statistic	**Std. Error**	
The minimum Revenue allocation to county governments of 15% of the GDP is adequate.	228	2.09	.083	1.245
The mandate/powers conferred on the Commission for Revenue Allocation in revenue allocation are sufficient	228	3.19	.093	1.147
County revenue taxes are adequate in running county governments	228	3.63	.062	1.135
Marginalized areas are adequately catered for by the current constitution	228	2.58	.087	.967
The role of the senate in revenue allocation is sufficiently provided for in the constitution	228	2.48	.091	1.081
Equalization fund is sufficiently addressed by the constitution	228	2.10	.088	1.113

Standardized Coefficients on Constitutional Influence on Revenue Allocation

Standardized coefficients beta was used to interpret the relative ranking of the factors in the model. It refers to how many standard deviations a dependent variable will change, per standard deviation increase in the predictor variable. Standardization of the coefficient is usually done to answer the question of which of the independent variables have a greater effect on the dependent variable in a multiple regression analysis, when the variables are measured in different units of measurement. As shown in table 4.32 the standardized coefficient indicates that the constitutional influence on revenue allocation is significant with a positive beta coefficient of 30.8%, which further confirms that constitutional influence on revenue allocation, has a positive influence on the revenue allocation model for the devolved government of Kenya.

Table 4.33: Coefficients of Constitutional Influence

Model	Unstandardized Coefficients		Standardized Coefficients	T	Sig.
	B	Std. Error	Beta		
(Constant)	17.130	2.214		7.381	.000

Constitutional influence on revenue Allocation	.435	.073	.308	4.898	.000

Using the summary presented in Table 4.32, a linear regression model of the form, $Y = \alpha + \beta X_i$ can be fitted as follows:

$Y = 17.130 + 0.435X_1 + \mu$ .....**Equation 4**

Pearson Correlation Coefficient for Constitutional influence on Revenue Allocation

Pearson's Correlation indicates the extent of interdependence between two variables. As already noted from Table 4.31, there is a 30.8% positive correlation between constitutional influence on revenue allocation and the revenue share per county in Kenya. The Pearson correlation coefficient is shown in table 4.33

Table 4.34: Pearson Coefficients for Constitutional influence on Revenue Allocation

		Revenue Allocation Per County	**Constitutional influence on Revenue Allocation**
Revenue Allocation per County	Pearson Correlation	1	.308
	Sig. (2-tailed)		.000
	N	228	228
Constitutional influence on Revenue Allocation	Pearson Correlation	.308	1
	Sig. (2-tailed)	.000	
	N	228	228

Table 4.33 indicates that constitutional influence on revenue allocation is statistically significant since its p-value is less than .05 (*p*-value =.000).

Regression analysis for Constitutional influence on Revenue Allocation

In order to rank the various factors in the order of their ability to influence revenue allocation, the study utilized regression. R is a measure of the correlation between the observed value and the predicted value of the criterion variable. R Square (R^2) is the square of this measure of correlation and indicates the proportion of the variance in the criterion variable which is accounted for by our model. In essence, this is a measure of how good a prediction of the criterion variable we can make by knowing the predictor variables. However, R square tends to somewhat over-estimate the success of the model when applied to the real world, so an adjusted R square value is calculated which takes into account the number of variables in the model and the number of observations (participants) our model is based on. This Adjusted R Square value gives the most useful measure of the success of our model. The results show

an Adjusted R Square value of 0.074; this means that the model has accounted for 7.40% of the variance in the criterion variable. The findings are shown in table 4.34.

Table 4.35: Model Fitness

Table 2. Model Summary

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	.308[a]	.095	.074	1.118

Analysis of Variance on Constitutional influence on Revenue Allocation

The study used ANOVA to determine the Model Significance. ANOVA assesses the overall significance of the model, determining if the test data fit to the model. A significance value of P<0.05 is allowed. The model has significance value of .000, the model is significant. Table 4.35 presents the result of these findings.

Table 4.36: ANOVA

Model		Sum of Squares	Df	Mean Square	F	Sig.
1	Regression	29.011	5	5.802	4.639	.000[a]
	Residual	277.668	222	1.251		
	Total	306.680	227			

Based on the empirical results presented in Table 4.35, the Null Hypothesis (H_{05}) is rejected and a conclusion reached that, at 5% level of significance, The Kenya Constitution plays a significant role in revenue allocation model for the devolved governments in Kenya. These results are in agreement with the findings the study done by Borck (2005) in Germany where he revealed that a notable characteristic of the German federation is the extensive constitutional and political interlocking of the federal and state governments as discussed in section 2.4.1 of this study. Similar findings were observed in South Africa where the Constitution did not leave the important matter of budget resource allocations to be subjected to the vagaries of day-to-day political machination (Morobe, 2001). In Nigeria the assignments of fiscal instruments are guided by constitutional provision. The federal constitution gave the federal government exclusive power to collect levies like customs and excise, company tax, education tax and mining rents, VAT etc. All these revenues (with the exception of education tax) are paid into the federation account for distribution among the three tiers of government in line with national constitution (Anderson, 2007). Theoretically this supports the legal theory of finance which states that the financial status of a country and its economic development is related to the legal system of that specific country. The legal system of any country is anchored on its constitution. Constitutional influence in revenue allocation is therefore a Key factor in determining the revenue share to the devolved governments in Kenya.

CONCLUSIONS AND RECOMMENDATIONS

The study sought to establish whether the Kenya Constitution 2010 influences revenue allocation in Kenya. The findings reveal that indeed there is a positive correlation between the constitutional guide and the revenue allocation Formula for the devolved governments in Kenya. This confirms that the constitution plays a critical role in determining the revenue allocation formula. Based on the empirical results from this study, the Null Hypothesis (H_0) is rejected and a conclusion reached that, at 5% level of significance, the Kenyan Constitution has an influence on revenue allocation in Kenya.

It was established that the Kenya Constitution plays a major role in determining the parameters to be used in revenue allocation formula in Kenya. Further, a linear regression model combining all the independent variable and the moderating variable were fitted. The results indicate that the beta coefficients of all the independent variables, were positive, demonstrating that they all have a positive contribution to the dependent variable, revenue allocation formula in Kenya.

Based on the study findings and conclusions, the study recommends that the CRA Parameters be enhanced so that their impact on the revenue allocation formula meets the basic principles of equity.

Factors Influencing The Adoption Of Information Communication Technology In Projects Managed By Community Based Organizations In Kenya: A Case Of Thika District

Dr. Joshua W. Tumuti

Email: tumuti.joshua@ku.ac.ke

INTRODUCTION:

In the era we live in today, it is virtually impossible to find an individual who does not have access to a cell phone, an email account or interacts with the internet in one way or another. Some of the internet usage includes communication, information search on goods and services, access to news online and e-commerce such as internet banking. The International Telecommunication Union (ITU) -an International Telecommunication regulatory body – states that in 2010, a quarter of the world's population or 1.9 billion people had access to computers in their home. Intuitively, this suggests that in order for organizations to effectively reach and serve their customers in this day and age, they must also adopt and use the same medium that their customers are using. Information Communication Technology (ICT) is the term given for this medium; it includes information and communications technologies such as computers, land-line telecommunications, mobile phones, other wireless communications devices, internet, other networks, broadband and various specialized devices ranging from barcode scanners to global positioning systems (Ministry of Economic Development, 2004). According to Sorsa and Underwood (2004) from a study they conducted on ICT adoption amongst Small to Medium Enterprises (SMEs) in Indonesia, pressure to adopt often came from the customer.

Adoption:

According to Pedersen (2003), ICT adoption generally takes three possible approaches namely: adoption, domestication and diffusion approach. The adoption approach is based on users applying different individual and social decision making theories to adopt ICT. In this approach, the three widely used models include the Technology Acceptance Model (TAM), the Theory of Reasoned Action (TRA), and the extension of TRA into a Theory of Planned Behavior (TPB). The domestication approach focuses on the process in which technology becomes an integral part of everyday habits. The diffusion approach or Roger's Diffusion of Innovation theory argues that media and interpersonal contacts provide information that influences a person's opinion and judgment. According to his theory, information filters through the networks and depending on the nature of the networks and the roles of its opinion leaders, new innovations are either adopted or rejected. Opinion leaders influence an audience through personal contact while intermediaries such as change agents and gatekeepers contribute to the process of diffusion. Empirical review revealed that some of factors influencing the adoption of ICT include; training, associated cost, perceptions & attitude and ICT policy.

ISBN 978-9966-132-53-6 @ Copy Right .2019

Training:

Most end-users from a non-technical background and particularly those from developing countries to a large extent do not fully comprehend what technology can do for them. This is due to the lack of exposure while in school. A review of project management curriculum for public universities in Kenya reveals a lack of ICT courses. Students who did not get hands on training in technology while in school usually come out with a different orientation on how they accomplish tasks and often tend to shy away from using technology in favor of manual methods even once they enter the workforce. Training can play an important role in increasing the awareness of the huge potentialities of ICT for concrete situations, in this way employees, managers and entrepreneurs can acquire a learning culture, integrating the training in their work activities and understanding in depth the potentialities of communication and information tools (Brady et al.,2002

Associated Cost:

According to Corder (2000) as quoted on PBWorks.com, funding is an essential condition (and major limitation) in many studies of CBO's technology adoption. However, it is not as simple as "getting more money means getting more technology". Funding donors are often moved by the social issues at the heart of a CBO's vision and mission statement; they therefore target funding to very specific programs or strategies, not for general ICT support or maintenance. It is therefore evident that funding somehow needs to be flexible to allow for spending across mission objectives, administration and ICT needs. Otherwise it will for a long time hold true what Allen Gunn mentioned in his address at the Craiglist Foundation 2007 Boot Camp "unless your mission is technology, technology is a moving target".

Perception and Attitude

According to Coleman and Young (2004), there are deep perception and attitudinal issues that need to be dealt with before ICT adoption can take root. It is not enough to build a better mouse trap: widespread adoption will only take place once cultural issues have been addressed. This was figuratively referring to the new attractive ICT features that vendors wanted to introduce to the market. It did not matter how good the new features were, how easy to use or how compelling the rate of their success; there were still deeper expectations and preferences from customers. Such issues are not on the surface and are usually hidden and difficult to bring out. In all organizations there exist organizational cultural norms which can not be ignored and thus need to be understood and addressed before any change can take place. People recognize with a familiar organizational cultural norm like wanting to physically attend meetings and be in the same physical location. There is also a general perception that web conferencing is for special events only. Another general perception that dominates the workplace is that if something has worked in the past, there is no reason to change, (don't fix what's not broke). Thus it is very difficult to get people to stop using or switch to something new. Creating lasting change therefore boils down to creating changes in individual perceptions and organizational cultures. Rhee and Kim's (2004) contention that a positive attitude towards technology is important in influencing ICT adoption.

ICT Policy:

Policies are guiding principles designed to influence decisions and actions (Kandiri, 2006). They offer important guidelines clearly demarcating the boundaries that must be adhered to while making decisions. Because of their objective nature, policies tend to be effective in eliminating biased perceptions and cultures. Without a

comprehensive ICT policy, an organization would lack a charted course of action when it comes to ICT issues. ICT policies within organizations usually ensure that their systems receive routinely and planned upgrades to keep up with evolving technology. ICT policies also dictate what software brand the organization is to adopt. ICT policies are a proactive approach that ensures an organization's system remains compatible therefore avoiding costly downtime and all out system outages. As noted by Stehr (2000) policy-making and regulation for ICT in developing counties is complex and a difficult challenge, the reality of poverty causes organizations to accept pirated software which might not be compatible with their systems. This behavior throws caution to the wind usually disregarding any policy or repercussions of using such software.

OBJECTIVES:

Empirical study was readily found extensively focusing on ICT adoption among Small to Medium Enterprises (SMEs) and industries such as construction, pharmaceutical, manufacturing, computer hardware/software, telecommunications and engineering. These studies were also mostly concentrated on developed countries. As a result, some organizations such as nonprofits, non-governmental organizations (NGOs) and CBOs have not gotten their fair share of attention despite their importance to the community. According to Opare (2007), CBOs are increasingly recognized as important actors in the development of rural communities. Improving their mode of operation and building their capacities would also positively impact the development of rural communities. It is however noted through empirical review that CBO ICT adoption and especially in developing countries has seldom been researched. This study therefore aimed to fill this gap by focusing on the factors influencing the adoption of ICT by CBOs in Kenya using a case of Thika District.

General Objective

The study was to analyze the factors influencing the adoption of ICT by CBOs in Kenya.

Specific Objectives

That guided the study were:

- To determine the effect of training on the adoption of ICT by CBOs in Thika District.
- To find out how cost associated with ICT influences the adoption of ICT by CBOs in Thika District.
- To find out how perceptions and attitudes influences the adoption of ICT by CBOs in Thika District.
- To examine how the organizational ICT Policy influence the adoption of ICT by CBOs in Thika District.

METHOD:

The research method used was descriptive in nature. This was most appropriate since the researcher aimed to only gather information about the variables as they occur within the sample population without manipulating them. A census was attempted since the sample was of manageable size.

The researcher obtained from the Social and Gender Services Thika, a list of all CBOs registered in Thika District which totaled 2,124 but out of this number only 34 were identified to have been active and in operation for the last two years. The CBOs are located primarily within the community both in rural and urban settings. And their activities are directed at improving the lives of the community in which they serve.

Self administered questionnaires which contained both open and close ended questions were dropped to each of the 34 CBOs and picked later. Each CBO received three questionnaires. There was purposeful sampling of respondents one from each of the varying ranks namely; manager/director, assistant manager and one employee/volunteer. The one respondent from employee/volunteer ranking was conducted by convenience sampling where researcher selected available employee/volunteer. The response rate was 82.4% where 28 out of the 34 CBOs filled out the questionnaires as agreed. This brought the population to 84 instead of the expected 102.

The research instrument was pre-tested on two CBOs outside Thika District. Three respondents from each CBO belonging to differing rankings were sampled giving a total of twelve instruments. According to Mugenda and Mugenda (1999) normally the pretest sample is between 1% and 10% depending on the sample size. The pre-tested instruments was analyzed to determine their validity and reliability and revised accordingly.

The data was organized and analyzed using descriptive and relational statistics. Quantitative data was analyzed using mean, mode, median and analysis of variance. Qualitative data was analyzed based on content analysis. Quantitative data was presented by use of statistical techniques which include frequency distribution tables and graphs. Qualitative data was presented using content analysis.

RESULTS:

Background Information:

To gain a general understanding of the respondents, the questionnaire asked questions to establish their gender, age, education level, role in the organization, length of service and educational background. The results are as follows:

Gender:

Distribution of respondents in terms of gender was not a significant factor as there were only twelve more male respondents than females. Male respondents were 57% (48) while females were 43% (36). The CBOs seemed to be gender balanced and therefore findings were presumed to be free from gender bias.

Age:

The age distribution amongst CBO respondents was also relatively evenly distributed indicating that all age groups were included in their staff portfolio. Fewer respondents however fell in the age brackets 26 - 35 and above 46. Majority of the respondents (38.1%) were between 36 – 45 years.

Education level:

A majority (43%) of respondents had college diplomas, followed by those who had undergraduate degrees (25%). A minority (6%) had only a primary education level. None of the respondents indicated to have tertiary education. In general the results indicated a high level of education by respondents.

Role in Organization:

When questionnaires were distributed to the CBOs they were requested to have one person from each of the different ranks fill out a questionnaire. However some managers and assistant managers delegated the task of filling out the questionnaire to employees/volunteers thus instead of receiving 28 respondents from each rank, the numbers varied by ranking. There were 42 employee/volunteer; which made up 50% of the respondents. This was followed by 25 assistant mangers (29.8%) and then 17 directors (20.2%).

Length of Service:

A majority of the respondents (46%) had worked in their particular CBO between 1 - 3 years; out of this number, 96% had worked for more than 1 year. This suggests that the respondents had served in their CBO long enough to know the status of ICT adoption within their organization, and the factors that influenced adoption.

Education/training Background:

A majority of respondents (43%) had an education background in community service. Project management (30%) and business related (24%) backgrounds were relatively close both having only a 6% variance between them. ICT related background was the least common with only 2% of respondents. These results suggested that the CBOs were prone to problems in adoption of ICT since very few of their employees had an ICT background. According to Coleman and Young (2004), when an organization has an individual with ICT background that person usually serve the role of mentor and helps other employees who might not be very ICT savvy. This person becomes the ambassador or ICT champion for promoting adoption of ICT within the organization.

Adoption

Adoption can be measured by how much ICT has been simulated in the organization in terms of; hardware, software and tasks performed.

Hardware:

It was noted that a majority (21 out of the 28) CBOs had between 1 – 3 desktop computers. The remaining 7 CBOs had more than 4 computers. Very few, only 2 CBOs indicated that they did not have computers at all. When it came to laptop computers; only four (4) out of the 28 CBOs owned laptop and none of them had more then 4 laptop computers. Since desktop computers are generally cheaper then laptops, this suggested a general reluctance of CBOs in Thika District to commit their resources to big ticket ICT items. Unfortunately this also limited them from taking full advantage of the conveniences offered by laptops like employees being able to take work home and flexible work hours.

Every CBO indicated to have some kind of peripheral device with most CBOs 65.5% owning printers. Web cams were the least common peripheral device with only 11.9% indicating to owning one.

A majority (73%) of respondents indicated to having basic cell phones (with no internet). In addition, 21.4% of the CBOs had more advanced 3G cell phones (internet ready). Only 10% had landline telephones. None of the CBOs

indicated having fax machines suggesting that most of their communication was being done via phone or internet (e-mail).

Software:

The types of operating systems the CBOs were running on their computers included; Windows 2000, 2003, XP, Vista and 2007. None of the respondents indicated to be running older operating system versions such as Windows 1995 or Windows 1998. This suggests that CBOs had updated computers able to run more advanced versions of Windows which require computers to have higher memory and other specifications.

Only (3 out of the 28) CBOs indicated to have project management software on their computers. MS Project was indicated to be the project management software used by the three CBOs. This indicates that although CBOs had to a large extent adopted hardware devices, they still had a long way in adopting project management software. This suggests that a knowledge gap exists in project management software which could probably be filled by academic institutions producing project management professionals.

Tasks performed:

The most common task performed by percentage use on CBO computers were; applying to donors for funding which (51.2%), report writing (14.3%), managing project tasks (13.1%), social networking (10.7%), e-mail communication (6%) and net browsing (4.8%). This indicates that a majority of the tasks performed on CBO computers were work related.

Factors Influencing ICT Adoption:

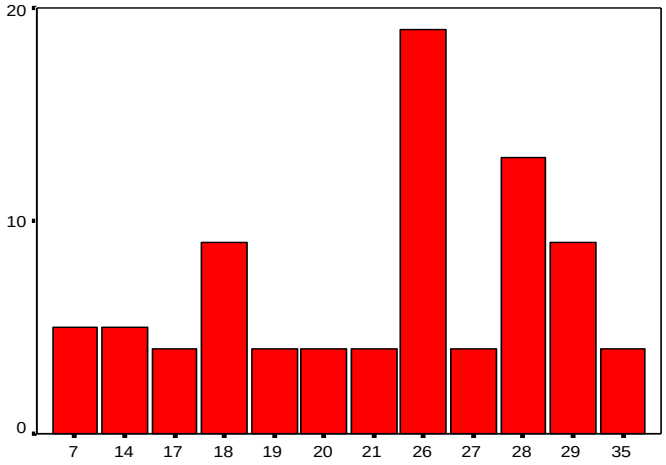
According to the research objectives the study set out to establish how training, associated costs, perception & attitudes and ICT policy influenced ICT adoption. The questionnaire asked specific questions towards this end and the results are as follows:

Training

The respondents were presented with seven items to measure the emphasis put by their organizations on training in ICT. They were to indicate the extent to which they agreed or disagreed with each statement on a 5-point Likert scale, with scores ranging from strongly agree to strongly disagree. The following figure shows the results of this analysis.

ISBN 978-9966-132-53-6 @ Copy Right .2019

Figure 1: Emphasis Put on ICT Training



Source: Research Data

Figure 1 shows that the scores obtained on the ICT training scale ranged from 7 to 35, with most of the respondents obtaining a score of 26. There were 37.3% (38) respondents who obtained scores below 21, meaning their CBOs put little emphasis on ICT training. 4.9% (5) respondents obtained a score of 21, denoting average emphasis on ICT training, while 57.8% (59) obtained scores above 21, indicating that their CBOs put high emphasis on ICT training. Thus, majority of the respondents indicated that their CBOs put high emphasis on ICT training.

The following table shows how the scores obtained by CBO members on the ICT training scale were distributed across the number of computers owned by the CBOs.

Table 1: ICT Training Scores Across Number of Computers Owned

No. of computers	**No. of respondents**	**Training mean scores**	**Std. Deviation**	
None	6	10.50	5.857	
1 – 3	60	22.82	5.655	
4 – 6	12	28.25	2.301	
7 – 10	6	28.50	3.507	
Total	**84**	**23.12**	**6.612**	

Source: Research Data

The table above shows that the CBOs with no computers had the lowest training mean scores, followed by those with 1 – 3 computers. On the other hand, CBOs with 7 – 10 computers had the highest training mean scores, closely

followed by those with 4 – 6 computers. This implies that CBOs which put emphasis on ICT training had adopted ICT more than those that did not invest in training.

An Analysis of Variance (ANOVA) test was conducted to determine whether the scores obtained on ICT training scale differed significantly among the members across the number of computers owned by their CBOs. The results of the analysis is presented in the following table.

Table 2: ANOVA Statistics for ICT Training Across Number of Computers

Source of Variation	Sum of Squares	df	Mean Square	F	Sig.*	
Between Groups	1450.576	3	483.525	17.758	.000	
Within Groups	2178.233	80	27.228			
Total	3628.810	83				

*significant at $p<0.05$

Source: Research Data

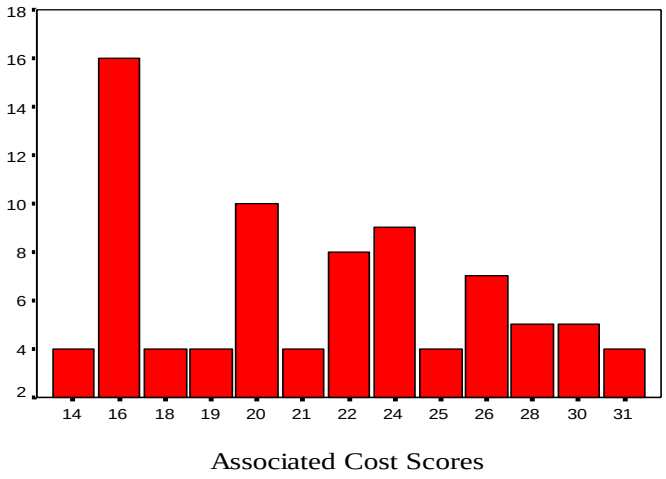
The table above shows that, based on the results of the ANOVA test, there were significant differences, at $p<0.05$, in scores obtained on the ICT training scale among CBO members across the number of computers owned by CBOs. Specifically, CBOs which put emphasis on ICT training had adopted ICT more than those that did not invest in training.

This means that CBOs investing more on ICT resources also invest on ICT training for their members. It could also show that training CBO members in ICT could promote adoption of ICT by the organizations. Previous studies have shown that lack of training significantly affects adoption of ICT. For instance, van Dijk and Hacker (2003) established that lack of skills is a major hindrance to ICT adoption among Dutch organizations. Similarly, a study by Kabbar and Crump (2006) on the factors that influence adoption of ICTs by refugee immigrants to New Zealand identified lack of training as a major factor.

Associated Costs

The respondents were presented with eight items to determine how associated costs impacted the adoption of ICT in their organizations. They were to indicate the extent to which they agreed or disagreed with each statement on a 5-point Likert scale, with scores ranging from strongly agree to strongly disagree. The following figure shows the results of the analysis.

Figure 2: Effects of Associated Costs on Adoption of ICT by CBOs



Source: Research Data

As shown in the Figure 2, the scores obtained on the associated costs scale ranged from 14 to 31, with most of the respondents obtaining a score of 16. It was established that 58.8% (60) of the members obtained scores below 24, meaning that they did not prioritize purchase of ICT resources in their financial planning. There were 11.8% (12) members with a score of 24, meaning they viewed associated costs to have average impact on ICT adoption. On the other hand, 29.4% (30) of the members obtained scores above 24, meaning they highly prioritized purchase of ICT resources in their financial planning.

Table 3 shows how the scores obtained by CBO members on the associated costs scale were distributed across the number of computers owned by the CBOs.

Table 3: Associated Costs Scores Across Number of Computers Owned

No. of computers	**No. of respondents**	**Costs mean scores**	**Std. Deviation**	
None	6	21.00	1.673	
1 – 3	60	21.08	4.670	
4 – 6	12	25.58	5.071

The table above shows that the members from CBOs without computers had the lowest mean scores, followed by those with 1 – 3 computers. On the other hand, CBOs that had 4 – 6 computers obtained the highest associated costs mean scores, followed closely by those with 7 – 10 computers. This is an indication that organizations that highly prioritized financing of ICT resources in their financial planning had adopted more than those who did not consider financing ICT resources a priority.

ISBN 978-9966-132-53-6 @ Copy Right .2019

An Analysis of Variance (ANOVA) test was conducted to determine whether prioritizing the financing of ICT resources differed significantly among the members across the number of computers owned by their CBOs. The results of the analysis are presented in Table 4.

Table 4: ANOVA Statistics for Associated Costs Across Number of Computers

Total	1980.952	83				

*significant at $p<0.05$

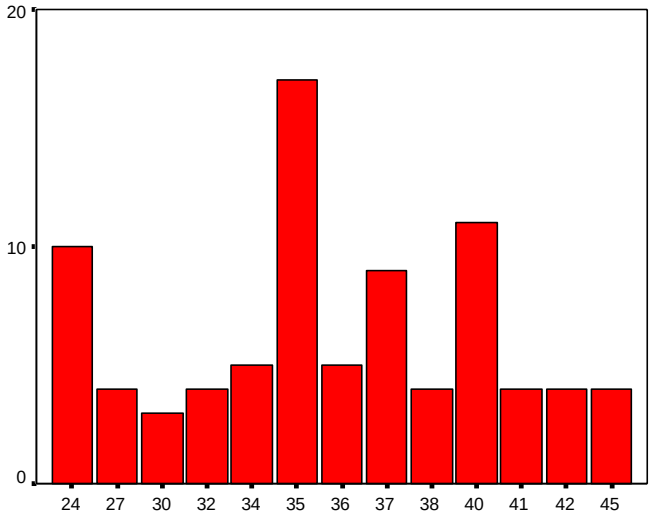
Source: Research Data

In the above table, ANOVA test results revealed that there were significant differences, at $p<0.05$, in scores obtained on the associated costs scale among CBO members across the number of computers owned by CBOs. Specifically, CBOs which highly prioritized financing of ICT resources in their financial planning had adopted more than those who did not consider financing ICT resources a priority. This is an indication that, regardless of the cost of acquiring ICT resources, financial planning can promote ICT adoption in CBOs. The findings are in line with previous studies, which have shown that lack of finances is a limiting factor for ICT adoption (Corder, 2000). However, even when organizations have finances at their disposal, financial planning and seeing ICT resources as a priority is needed for adoption to occur. For CBOs to invest finances on ICT resources, they have to appreciate the benefits of ICT adoption.

Perceptions and Attitudes

The CBO members were presented with nine items to determine how perceptions and attitudes impacted in adoption of ICT in their organizations. They were to indicate the extent to which they agreed or disagreed with each statement on a 5-point Likert scale, with scores ranging from strongly agree to strongly disagree. The following figure shows the results of this analysis.

Figure 3: Attitudes Towards Adoption of ICT in CBOs



Attitudes towards the adoption of ICT

Source: Research Data

As shown the figure above, the scores obtained by CBO members ranged from 24 to 45, with the majority obtaining a score of 35. Only 11.8% (12) obtained scores below 27, meaning they had negative attitudes toward adoption, while 4.9% (5) members obtained a score of 27, meaning they had neutral attitudes. This shows that majority (83.3%) of the CBO members had positive attitudes toward adoption of ICT. Table 5 shows how the attitudes of CBO members were distributed across the number of computers owned by the CBOs

Table 5: ICT Adoption Attitudes Across Number of Computers Owned

No. of computers	No. of respondents	Attitudes mean score	Std. deviation	
None	6	24.50	1.225	
1 – 3	60	35.47	5.199	
4 – 6	12	36.67	4.250	
7 - 10	6	38.83	3.920	
Total	**84**	**35.10**	**5.675**	

Source: Research Data

The table above shows that members of CBOs with 7 – 10 computers had the highest attitude mean scores (38.83) followed by those from CBOs with 4 – 6 computers, while those without computers had the lowest attitude mean scores. This suggests that CBOs with positive attitudes towards adoption of ICT had invested more on ICT than those with negative attitudes. To confirm these results, an Analysis of Variance (ANOVA) test was conducted to determine whether attitudes toward adoption of ICT differed significantly among the members across the number of computers owned by their CBOs. The results of the analysis are presented in Table 4.20.

Table 6: ANOVA Statistics for Attitudes Across Number of Computers

Source of Variation	Sum of Squares	df	Mean Square	F	Sig.	
Between Groups	795.305	3	265.102	11.293	.000

Total	2673.238	83				

*significant at p<0.05

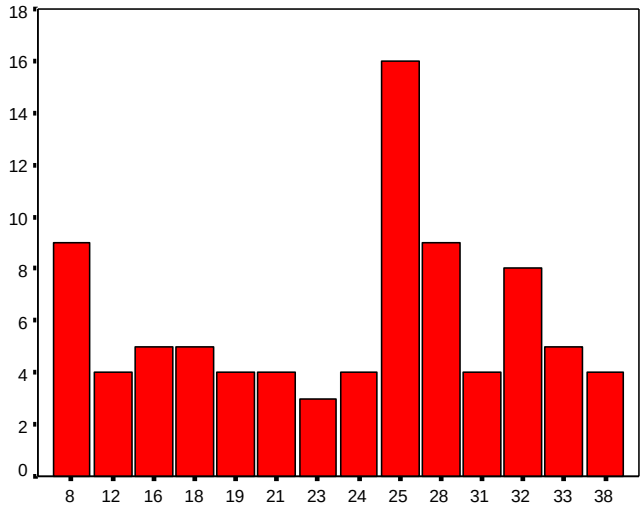
Source: Research Data

The results of ANOVA test as shown in the above table revealed that there were significant differences at p<0.05, in attitudes toward ICT adoption among CBO members across the number of computers owned by CBOs. Specifically, CBOs whose members had positive attitudes towards ICT adoption had invested more in ICT resources than those whose members had negative attitudes. This implies that perception and attitudes affect ICT adoption among CBOs. Rogers (1995), in his Diffusion of Innovation Theory, argues that one of the major factors affecting people's attitudes toward a new technology is the attributes of the technology itself. Rogers (1995) identified five main attributes of technology that affect its acceptance and subsequent adoption: relative advantage, compatibility, complexity, observability, and trialibility. Thus, a new technology will be increasingly adopted if potential adopters perceive that the innovation; has an advantage over previous innovations; is compatible with existing practices; is not complex to understand and use; shows observable results, and can be experimented with on a limited basis before adoption.

ICT Policy

The CBO members were presented with eight items to determine how ICT policy affected adoption of ICT in their organizations. They were to indicate the extent to which they agreed or disagreed with each statement on a 5-point Likert scale, with scores ranging from strongly agree to strongly disagree. The following figure shows the results of the analysis.

Figure 4: ICT Policy Scores



Source: Research Data

The figure above shows that CBO members obtained scores ranging from 8 to 38, with most of them (16) obtaining a score of 25. It was indicated that 40.2% (41) of the members obtained scores below 24, meaning that they perceived ICT policy to have no effect on adoption of ICT in their organizations. There were 4.9% (5) CBO members who obtained 24 denoting average effect of ICT policy on adoption, while 54.9% (56) obtained scores above 24, meaning that they perceived ICT policy to have an effect on adoption of ICT in their organizations.

Table 7 shows how the scores obtained by CBO members on the ICT policy scale were distributed across the number of computers owned by the CBOs

Table 7: ICT Policy Scores Across Number of Computers Owned

No. of computers	**No. of respondents**	**ICT policy mean scores**	**Std. Deviation**	
None	6	12.00	6.693	
1 – 3	60	23.65	7.350	
4 – 6	12	26.83	7.849	
7 – 10	6	25.17	10.108	
Total	**84**	**23.38**	**8.173**	

Source: Research Data

The table above shows that the CBOs whose members did not have computers had the lowest mean scores, followed by those with 1 – 3 computers. On the other hand, CBOs whose members had 4 – 6 computers obtained the highest

ICT policy mean scores, followed closely by those with 7 – 10 computers. This suggests that organizations with ICT policies had invested more on computers, which is an indicator of ICT adoption.

An Analysis of Variance (ANOVA) test was conducted to determine whether scores obtained by CBO members on ICT policy scale differed significantly across the number of computers owned by their CBOs. The results of the analysis are presented in Table 8.

Table 8: ANOVA Statistics for ICT Policy Scores Across Number of Computers

Source of Variation	Sum of Squares	df	Mean Square	F	Sig.*
Between Groups	943.660	3	314.553	5.470	.002
Within Groups	4600.150	80	57.502		
Total	5543.810	83			

*Significant at p<0.05

Source: Research Data

As shown in the table above, ANOVA test results indicated that the scores obtained by CBO members differed significantly at p<0.05 across number of computers owned. The results further indicate that organizations with ICT policies had invested more on ICT, suggesting that ICT policy in organizations affect adoption of ICT. Having a clear ICT policy in an organization is important as it forms the foundation for decision making; it offers important guidelines clearly demarcating the boundaries that must be adhered to while making decisions. Tusubira and Mulira (2004) argue that integration of ICT in an organization's functions is a complex process, and it therefore needs to be fully conceptualized and defined before implementation to avoid dissipation of resources through implementation of unrelated or uncoordinated projects. The organizational ICT policy needs to be defined and agreed. This sets the direction, functions, and boundaries as well as targets of ICT in the organization. ICT policy provides a framework for the development and implementation of specific projects aimed at increasing efficiency and cost-effectiveness.

Ranking

The CBO members were asked to rate training, associated costs, perception and attitude and ICT policy on a scale of 1 – 4, in relation to how they perceived these factors influenced ICT adoption in their organization. According to the scale, 1 denotes the most influential factors while 4 denotes the least influential factor. Their responses are shown in Table 9.

Source: Research Data

CONCLUSION

Based on the findings of this study, it can be concluded that most CBOs in Thika district had adopted ICT to some extent. It was found that most of the CBOs had computers and mobile phones, together with other peripheral computing devices such as printers, copiers and scanners. The following are additional conclusions based on the specific objectives of the study:

The first objective was to determine the effect of training on the adoption of ICT by CBOs in Thika District. According to Garnam (2000), a major roadblock to technology adoption is lack of continuous training. He argues that even if technology was to become available, it would sit dormant, underutilized or misused if employees are not trained on how to use it. If organizations are not willing to train employees how to use technology it has purchased it is better that they do not spend the money on such technology; rather channel the money to other needs. It was found that most of the CBOs put high emphasis on training of their members in ICT, and this positively influenced adoption of ICT by the organizations. The second objective was to find out how cost associated with ICT influences the adoption of ICT by CBOs in Thika District. It has been found that the initial cost of technology combined with the need for regular upgrades is a major limiting factor for technology adoption (Kabbar, 2006). Most organizations overcome this hurdle by prior planning for ICT needs. According to Liberatore (2003), once ICT related expenses become a line item on the company budget, ICT starts to become a reality. This takes on a proactive approach to acquiring and maintaining a robust ICT infrastructure. It is the conclusion of the study that majority of CBOs in Thika district did not prioritize purchase of ICT resources in their financial planning. CBOs which highly prioritized financing of ICT resources in their financial planning had adopted ICT more than those who did not consider financing ICT resources a priority. The third objective was to find out how perceptions and attitudes influence the adoption of ICT by CBOs in Thika District. Majority of the CBO members indicated to having positive attitudes toward adoption of ICT, and CBOs whose members had positive attitudes towards ICT adoption had invested more in ICT resources than those whose members had negative attitudes. This implies that perception and attitudes affected ICT adoption among CBOs in Thika district. According to Warschauer (2004), Integration of ICT in any

organizations only happens after ICT is first integrated into the minds and attitudes employees. Also according to Warschauer (2004), change of mindset about ICT will go far in reducing the digital divide as well foster technology and social inclusion in developing countries. It can be concluded therefore that perception and attitudes were indeed found to have an effect on ICT adoption. The fourth objective was to examine how the organizational ICT Policy influences the adoption of ICT by CBOs in Thika District. The study established that majority of the CBO members in Thika district strongly perceived ICT policy in their organizations to have an effect on adoption of ICT. The study found that organizations who indicated having ICT policies in place in their organizations also had invested more on ICT; suggesting that ICT policy in organizations affect adoption of ICT. This is in line with Tusubira and Mulira (2004) who state that ICT policy is key to the development and implementation of efficient and cost-effective ICT infrastructure that is sustainable because it provides a direction and boundaries as well as targets of ICT in the organization. Without an ICT policy the organization will not have a reference point to guide it towards adoption. In conclusion ICT Policy was indeed found to have an effect on ICT adoption.

In summary, it can be concluded that adoption of ICT by CBOs is affected by training, associated costs, perception and attitudes, and organizational ICT policy.

Abstract

Industrialization is crucial in the development of many economies around the world. The Asian economies had a share in global Manufacturing Value Added (MVA) of 35.06% while African economies had 22.26%. Due to the industrial potential in African and Asian economies, this paper is motivated to examine digital business and global

trends for industrialization. Specifically, this paper examines digital technologies in business and industrial output by comparing African and Asian economies. Documentary research approach which is supplemented by literature review analysis is the methodology adopted in this paper. The analysis shows that the main sectors for industrialization which are agriculture, industry, manufacturing and services indicate differences in output between the African and Asian economies. In addition, the paper reveals that the Asian economies have comparative advantages in technological spill-over and ability to sustain the growth of manufacturing production compared to African economies in terms of industrialization. On the other hand, the African economies had a comparative advantage on total output for agriculture in 2015 compared to the Asian economies. Therefore, the implication is that although digital technologies in business exist in both African and Asian economies, the trend to success in industrialization in relation to digital business is mainly through technological spill-over and sustaining manufacturing production.

Keywords: ***digital business, global trends, industrialization, Africa, Asia, economies***

INTRODUCTION

Industrialization is crucial in the development of many economies around the world. However, according to the United Nations Industrial Development Organization (UNIDO) in 2017, the importance of manufacturing industries show that there is a declining trend in industrialized economies while there is an increasing trend for developing and emerging industrial economies. For instance, Asia and Pacific region covered almost half of global manufacturing production in 2016 (UNIDO, 2017). The Industrial Development Report 2018 by UNIDO (2017) noted that in 1990 to 2016, the average annual rate of growth of global Manufacturing Value Added (MVA) rose from 2.9% to 3.1 % and at the same time slowed in industrialized economies from 2.3% to 1.3% while for developing and emerging industrial economies, there was an increase from 5% to 5.6%. The Asian economies had a share in global MVA of 35.06% while African economies had 22.26% (Chang & Zach, 2018).

The global trends for industrialization in terms of MVA show that developing and emerging industrial economies are performing better than industrialized economies. In Africa, the increase in MVA is attributed to various factors. These factors include, business to business spending in manufacturing which is projected to be USD 666.3 billion by 2030, leadership like the African Union (AU) has put the sector at the front and center of its Agenda 2063, and many Africa countries such as Ethiopia, Kenya, Tanzania and Uganda have recently adopted policies to enable manufacturing and industrial development (Signe, 2018). The economy of Asia shows that East Asia's total MVA is higher than that of Europe and Americas who are the old industrial centres of the word and thus making East Asia the largest industrial core region in the world (Chang & Zack, 2018). A number of reasons have lead to the increase of MVA in Asian economies. For example, in India, 6000 quality products were contributed by the Micro, Small and Medium Enterprises (MSME), and that MSMEs are considered as the backbone of India's economy (Gade, 2018). However, studies such as UNIDO (2017) and Gade (2018) have noted the lagging behind of technology for both Africa and Asia.

The aspect of technology implies the need to examine technology further and in particular digital business in the Africa and Asia economies in relation to industrialization. Businesses that embrace new technologies capture more data, improve processes and empower workers to be more effective at their jobs (Brown, 2015). With the shift of manufacturing production from industrialized economies to developing and emerging industrial economies as indicated by UNIDO (2017), and also due to the industrial potential in African and Asian economies, this paper is motivated to examine digital business and global trends for industrialization. The comparative advantage theory guides this paper's specific objective of examining digital technologies in business and industrial output by comparing African and Asian economies so as to highlight their comparative advantage and sources of comparative advantage and how each economy can learn from each other.

LITERATURE REVIEW

Theoretical Framework

In 1817, the comparative advantage theory was originated by Ricardo with the assumption that there are trade benefits even in the absence of absolute advantage (Watson, 2017). A number of studies have adopted the comparative advantage theory to examine production differences between countries (Jabara & Thompson, 1980; Sejkora & Sankot, 2017; Mkwizu & Dominic, 2018; Cinquetti, 2018). Sejkora and Sankot (2017) applied comparative advantage theory and argued that there were relative productive manufacturing industries in chemicals and various materials for Senegal compared to other countries and that footwear was an example of unexploited potential. Skejkora and Sankot (2017) concluded that Senegal should focus on footwear and apparel production in order to promote industrialization and accelerate GDP growth rate. This study also adopts the comparative advantage theory to guide the comparative analysis on the relative comparative advantage for Africa economy Vs Asia economy by examining digital business and global trends for industrialization. In applying the comparative advantage theory, this

study specifically examines digital technologies in business and industrial output by comparing African and Asian economies

Global Trends in Industrialization: African Vs Asian Economies

Manufacturing Value Added (MVA) is an industrial trend worldwide (UNIDO, 2017). Globally, MVA is the major driver of economic growth and creation of new goods (UNIDO, 2017). The growth of global MVA was USD 12,316 billion in 2016 (UNIDO, 2017).

The African economy has witnessed a rise in MVA. According to Signe (2018), Africa's manufacturing growth annually was 3.5% from 2005 to 2014 and this was faster than the rest of the world. In the industrial development report of 2018 by UNIDO (2017), Africa's annual MVA growth rose from 1.4% in 1990-2000 to 4% in 2000-2016. Signe (2018) noted that the industrial production in Africa is resource-based manufacturing which accounts for half of the total MVA and that the total MVA is driven by high level of industrial development in North and South Africa while other countries such as Nigeria and Angola had increase in output of 10% annually. However, the MVA record for Sub-Saharan Africa was USD 145 billion in 2017 which is far behind that of East Asia (Signe, 2018). UNIDO (2017) sighted that developing and emerging industrial economies produced largely basic consumer goods. In contributing to the trend of largely basic consumer goods in industrialization for Africa, Mkwizu, Wilbard, Mbilinyi and Maliva (2018) carried a study in Tanzania by examining industrial products from the perspective of consumer's convenience shopping and found that location is one of the factors that influence consumers' convenience shopping of industrial products. Another study by Mwang'onda, Mwaseba and Juma (2018) recommended that Tanzania should put emphasis on innovation and agro-allied resourced-based industries in order to sustain manufacturing growth.

Furthermore, Chang and Zack's study showed that trends for the main industrial sectors such as agriculture indicated that in 2005, African economies performed better than Asian economies. The Alliance for a Green Revolution in Africa (AGRA) stated that Africa's agricultural growth rate improved after 2005 by an average of 7% annually and this is because of commodity price boom and expansion of cropped area (AGRA, 2017). Nepad (2013) noted that compared to other continents, Africa is dominated by family farming which relies solely on family labour. The report in 2015 also showed that African economies particularly Sub-Saharan Africa had agricultural value added of 15% to GDP compared to less than 10% for East Asia & Pacific (African Development Report, 2015). This further implies that the African economy in terms of agricultural value added was performing better than the Asian economy. Moon and Lee (2010) pointed out that some sub-regions in Asia have intrinsic comparative disadvantages in agricultural production with low food self-sufficiency rates.

From the MVA perspective, the Asia economy as an Asia and Pacific region has overtaken Europe which was once the world's largest manufacturing region (UNIDO, 2017; Chang & Zack, 2018). China as one of the Asian countries has the world's largest share of MVA at 24.4% in 2016 from 12.6% in 2006 (UNIDO, 2017). One of the reasons for the successful growth of MVA for the Asian economy is because of the major shift by industrialized economies to relocate manufacturing production to the developing world (UNIDO, 2017). Other reasons that have led the growth of MVA for the Asia economy is production through cheap labour as well as transferring labour from sectors with low and slowly growing productivity to the industrial sector (Chang & Zack, 2018); capital investment (Wu et al., 2016); and ability to sustain manufacturing output (Chang & Zack, 2018). However, the working-age population in China is expected to slow and capital investment has also slowed down (United Nations, 2015; Wu et al., 2016). Current initiatives in China are "Made in China 2025" and "Internet Plus" which are programs to digitalize China's manufacturing sector as well as enhance efficiency and raise manufacturing value by using digital technologies (Wu et al., 2016).

Digital Business for African Vs Asian Economies

Digital business is the use of technology to create new value in business models, customer experiences and internal capabilities that support its core operations (Liferay, 2019). According to Liferay, digital business also refers to both digital-only brands and traditional players that are transforming their business with digital technologies. Prior study by D'Cruz, Timbrell and Watson (2015) mentioned that organizations are investing heavily in digital technologies. Digital business centers on how technology allows companies to create new value and experiences which enables companies to have a competitive edge over their peers (Liferay, 2019). For purposes of this paper, digital business is considered as businesses that use digital technologies in adding value to products and services.

The African economy made up of several countries are adapting to the digital future (Banga & te Velde, 2018). African countries include Angola, Egypt, Cameroon, Botswana, Kenya, Mozambique, Rwanda, Tanzania, Uganda and Zambia. According to the report by Banga and te Velde (2018), Kenya is the leading African country in digitalization with increased internet penetration of 25% from 2001 to 2006. In 2007, Finger noted that the mobile wireless networks have contributed to the phenomenal growth of mobile telephony in Africa. In addition, the

literature on Africa's mobile economy mentioned that the 2016 Smartphone penetration for Africa is 30% compared to 51% global average (GSMA Intelligence, 2016; Dall'Omo, 2017). Africa is also using digital technologies such as mobile internet to add value to products and services. The best example of digital technology in mobile internet that has transformed the way businesses are transacted in Africa is the digital service innovation from Kenya which is called M-Pesa. Mohamed (2015) pointed out that M-Pesa was introduced by Safaricom in Kenya as a mobile money transfer service and thereafter many other Mobile Network Operators (MNOs) have launched various versions of mobile money services.

However, African countries benefit less from increasing levels of digitalization (Banga & te Velde, 2018). For example, for African countries to digitalize, manufacturing should consider issues such as developing complementary skills, increase access to internet and other Information and Communication Technologies (ICT) by implementing policies that are country-specific and also contribute towards firm capabilities, ICT infrastructure and national innovation (Banga & te Velde, 2018). There are various digital businesses in the African economy. The study by Ndung'u (2018) on digital potential for Africa indicated examples of digital businesses which include M-Akiba, M-Kopa and One Acre Fund. For instance, M-Akiba is a micro-investment in government securities using mobile phone payments platform which enables Kenyans to save money and earn interest every six months while M-KOPA is an innovative solar power solution program that enables low-income consumers to acquire high-quality and affordable energy (Ndung'u, 2018). On the other hand, One Acre Fund makes it possible for small-holder farmers in Kenya to repay loans digitally using M-Pesa rather than using cash (Ndung'u, 2018). From the literature, it is evident that Africa embraces digital business.

Asian economy has also embraced digital business. Gartner (2014) predicted a rise in technology spending of 7.4% in the Asia Pacific region. Examples of digital businesses in the Asian economy are Alibaba and eBay in China (Deloitte, 2017). The Asian economy is made up of countries such as Bangladesh, China, India, Indonesia, Malaysia, Pakistan, Philippines, South Korea, Sri lanka, Taiwan, Thailand and Turkey (Chang & Zack, 2018). Furthermore, in embracing digital, China's new vision is "Digital China" which aims to make Chinese enterprises embrace digitalization by investing in digital technologies in order to generate fresh revenue streams through delivery of new forms of value to customers (Wu, Narsalay, Qiu, Yu & An, 2016). Wu and others pointed out that in Internet plus program for China, there is emphasis not only for business to use technologies such as mobile internet, big data and cloud computing but also develop new sources of revenue. Subsequently, OCED (2018) noted that:

> *Underdeveloped infrastructure also significantly constrains the development of the digital economy in much of emerging Asia. Less than 30% of the population is online in India, Indonesia and the CLM countries, which have the fewest number of secure Internet servers for their population, less high-speed broadband Internet (minus Indonesia) and relatively high Internet prices (along with the Philippines). The number of secure Internet servers relative to the total population is significantly higher in Singapore than in the rest of the region, with 932.1 servers per million people, though Brunei Darussalam and Malaysia also have more than 100 secure servers for every million people. (OCED, 2018)*

Other related obstacles in digital business for the Asian economies exist. For instance, the report by Kearney (2015) indicated that there are roadblocks to a full digital economy and these are; weak business case for building out broadband; regulation inhibiting innovation in mobile financial services and e-commerce; low consumer awareness and trust hindering the uptake of digital services; lack of single digital market; and limited supply of local content.

The existing literature on digital business through the use of digital technologies for both African and Asian economies can be summarized using Table 1.

Table 1: Digital Business for African Vs Asian Economies

Economies	**Digital Technology**	**Digital Business**	**Source**
Africa	Mobile Internet	M-Pesa, M-Akiba, M-Kopa, One Acre Fund	Ndung'u (2018)
Asia	Internet	Alibaba, eBay	Deloitte (2017)

METHODOLOGY

This study uses a documentary research approach and review of literature to examine digital business and global trends for industrialization by comparing African and Asian economies. Table 2 shows the production trends in main sectors of the African and Asian economies which are agriculture, industry, manufacturing and services from 1950 to 2005 for gross value added in the economy as percentage of GDP.

Table 2: Production in main sectors for African Vs Asian Economies

Economies	1950				1980				2005			
	Agr	Ind	Mf	Sv	Agr	Ind	Mf	Sv	Agr	Ind	Mf	Sv
Africa	44	19	9	36	25	32	14	43	26	30	12	45
Asia	49	14	10	36	25	33	22	42	13	35	24	52

Note: agr (agriculture), ind (industrial), mf (manufacturing), sv (services)

Source: Chang & Zach (2018)

DISCUSSION

The analysis on trends in industrialization based on Table 2 shows that the main sectors for industrialization which are agriculture, industry, manufacturing and services indicate differences in output between the African and Asian economies. The Asian economy had a steady growth in share of manufacturing in GDP from 10% in 1950, 22% in 1980 and 24% in 2005 compared to the African economy. The steady growth in manufacturing output combined with the largest share of MVA in the world in 2016 are attributed to cheap labour, capital investment and ability to sustain manufacturing growth as noted by Wu et al (2016) and Chang and Zack (2018). This suggests that cheap labour, capital investment and ability to sustain manufacturing growth are sources of comparative advantage of the Asian economy over African economy. In addition, the Asian economies have comparative advantages in technological spill-over compared to African economies in terms of industrialization. On the other hand, although the Asian economy performed better in agricultural sector during 1950, the African economies achieved agricultural output of 26 compared to only 13 for the Asian economy in 2005 and this suggests that for 2005, the African economy had a relative comparative advantage over the Asian economy in the share of agricultural in GDP.

In connecting digital technologies and industrial output, the Asian economy through digital business like Alibaba and eBay use internet technology to help buyers and sellers to sell and buy products and thus assist to provide markets for industrial products. However, Kearney (2015) pointed out that there is lack of single digital market which is one of the obstacles for the digital business in the Asian economy, and OCED (2018) also cited other barriers to digitalization include underdeveloped infrastructure. In comparison to the African economy, the digital business in Africa like One Acre Fund use the M-Pesa which is a digital technology based on digital service innovation to assist small-holder farmers to repay loans digitally instead of using cash. Although Africa has digital potential, Banga and te Velde (2018) emphasized that manufacturing should consider issues such as developing complementary skills, increase access to internet and national innovation.

CONCLUSION AND IMPLICATIONS

The focus of this paper was to study digital business and global trends for industrialization with the specific objective of examining digital technologies in business and industrial output by comparing African and Asian economies. This paper reveals that both African and Asian economies embrace digital business through the use of digital technologies in relation to industrialization. Although both economies use digital technologies in businesses for industrialization, the Asian economy is performing better and thus achieved a relative comparative advantage on the trends for Manufacturing Value Added (MVA) in the manufacturing industry compared to African economy and the sources of comparative advantage are from availability of cheap labour, capital investment and the ability to sustain growth manufacturing output. The African economy notably performed better than Asian economy from the industrial sector related to agricultural and this was due to the trends such as in resource-based capacity and family farming.

Furthermore, the difference between African and Asian economies is that the African economy has a comparative advantage compared to the Asian economy in terms of the digital technology through mobile internet from the perspective of one of the best digital service innovation on mobile money services in the world called M-Pesa. On the other hand, the Asian economy has a comparative advantage over the African economy due to embracing digital technology of internet resulting in services such as Alibaba and eBay. Hence, from the comparative advantage theory, this paper shows that the African economy has a relative comparative advantage on mobile internet as a trend digital technology used in businesses compared to the Asian economy while the Asian economy has a relative comparative advantage on MVA compared to the African economy.

Therefore, the implication is that although digital technologies exists in both African and Asian economies, the trends to success in industrialization in relation to digital business is mainly through technological spill-over and sustaining the manufacturing production. The African and Asian economies can learn from each other. Both economies can learn from each other's strength. Other studies can explore 3D printing and cloud computing as trend technologies in relation to industrialization.

ICT Usage in Panelist Sessions to Enhance Completion of PhD Studies in Public Universities: Study of Uganda and Tanzania

Kagoya M. Sumaya
E-mail: thumakago@gmail.com

Dr. Kezia H. Mkwizu
E-mail: kmkwizu@hotmail.com

Abstract

In PhD Studies, majority of PhD programs in Universities are for a period of 3 to 4 years for a PhD student to graduate. However, attaining a Doctor of Philosophy (PhD) has challenges which hamper the normal progress. For example, only 41% of students during their PhD studies are able to overcome the challenges they encounter. Academic institutions have rules governing them in all academic aspects which should be followed by staff and students. At PhD level, students present their work to the panelist comprising of a group of professors, doctors and a secretary whose role is to record comments raised by the panelist. Unfortunately, this traditional means of notes taking by the secretary using pen and paper and the panicking student anguished by examination fever, renders some vital information to be omitted and causes delays in receiving the official comments. This not only minimizes the quality of the PhD work presented, but also delays the PhD student(s) from completing the program on time thus increasing financial costs among others. Past scholars have averred that for a PhD student to finish her or his PhD program in time depends on factors like inadequate money to meet the tuition fees, travel expenses, social issues, health issues and lack of commitment. However, there is scant literature on trends addressing the issue of ICT usage during the panelist sessions hence the need for research on the use of ICT like video cameras during presentations to curb mismatches of comments and other related snags. Therefore, this paper examines ICT usage in panelist sessions to enhance completion of PhD studies in public Universities in Uganda and Tanzania. Quantitative data was analyzed using descriptive statistics and PLS-SEM with results showing a significant relationship between ICT usage in panelist sessions and success in completion of PhD studies in Tanzania and Uganda. The outcome of this study can assist Universities to improve panelist sessions during PhD presentations.

Key words: ***ICT Usage, Panelist sessions, PhD Students, Public Universities***

INTRODUCTION

In the course of pursuing Doctor of Philosophy (PhD) Studies in Universities, PhD students are faced with financial and economical challenges during their academic journey (Manyika & Szanton, 2001). Other challenges noted in recent studies include ergonomics and ICT (Hamilton-Ekeke & Mbachu, 2015; Global Digital Report, 2018; Masele & Kagoya, 2018). The article by Masele and Kagoya (2018) concluded that policy makers and legislators should consider ergonomics in policies related to higher education. Other scholars in adding literature on higher institutions of learning indicated that for higher institutions of learning, the ranking of high performing research quality of any university is based on excellent usage of ICT facilities based on its quality of ICT infrastructure and use of ICT in teaching and research (Mutula, 2009, World University Ranking, 2018).

Although past literature highlighted challenges in PhD studies including drop out and through-put rates (Manyika & Szanton, 2001; Badat, 2008; Mutula, 2009; Hamilton-Ekeke & Mbachu, 2015; Global Digital Report, 2018; Masele & Kagoya, 2018), very few have mentioned about panelist sessions. For instance, Mkwizu (2018) examined PhD programs with the conclusion that mismanagement by panelists during the panelist sessions contribute to delay in completing PhD programs and that in combating the situation, PhD students need to be shifted to other departments within the University which are competent in handling panelist sessions hence building as well as enhancing a culture of competency in managing panel sessions by panelists. Limited literature on ICT in relation to PhD studies and the continued challenges related to PhD studies motivates this paper to examine ICT usage in panelist sessions to enhance completion of PhD studies in public Universities.

LITERATURE REVIEW

Definition of key terms

ICT Usage

ICT Usage in this study refers to panelist members' ability to use recorders, videos cameras, excellent projectors, comments tracking and records information management systems during PhD students' presentations for systematically controlling the creation, distribution, use, maintenance, and disposition of recorded comments maintained as evidence of university activities in the digital era to enable students complete their PhD studies in time.

Panelist sessions

For purposes of this paper, panelist sessions are termed as sessions where PhD students present their work to panelists comprising professors, doctors and a secretary.

PhD Students

This paper defines PhD Students as those students pursuing PhD programs in public universities for a period of 3 to 4 years in order to graduate with a PhD.

Public Universities

In this paper, public universities are referred to as Makerere University Business School and University of Dar es Salaam Business School.

Theoretical Literature Review

The theory of Unified Theory of Acceptance and Use of Technology (UTAUT) was developed in 2003 by Venkatesh, Morris, Davis and Davis. It basically assumes that individual's behavioral intention to use technology is influenced by performance expectancy, effort expectancy, social influence, and facilitating conditions. The application of UTAUT theory is evident in subsequent studies such as; AlAwadhi and Morris (2008), Abdelghaffar and Magdy (2012), Venkatesh, Thong and Xu (2012, 2016). For example, Abdelghaffar and Magdy (2012) applied UTAUT to examine the adoption of mobile government services in developing countries and found that for the case of Egypt, factors of perceived usefulness, compatibility, awareness, social influence and face-to-face interactions significantly contributed in predicting intentions to use mobile government. This paper selected UTAUT due to its emphasis on individual's use of technology. Hence UTAUT application in this paper guides in the analysis of the relationship of information technology and enhancing completion of PhD studies. This paper hypothesizes that there is a positive relationship between ICT usage in panelist sessions and completion of PhD studies.

Empirical Literature Review

ICT usage in education has received the attention of several scholars recently such as Bello and Aderbigbe (2014), Obahiagbon and Osahon (2014), Hamilton-Ekeke and Mbachu (2015), Nkoyo and Nsata (2016), Jumare, Tahir and Hamid (2017), Thomas and Oladejo (2017), Tella, Orim, Ibrahim and Memudu (2017), Falode, Shittu, Gambari and Falode (2018), Iroaganachi and Izuagbe (2018), and Agboola et al (2018). The study by Hamilton-Ekeke and Mbachu (2015) conducted in Nigeria examined the place of ICT in teaching and learning using regression analysis and found that there were inadequate ICT facilities in Universities. Nkoyo and Nsata (2016) added to the literature of ICT in education by exploring availability and utilization of electronic resources by postgraduate student. By applying descriptive survey design, Nkoyo and Nsata (2016) found that there was inadequate availability and utilization of electronic resources by postgraduates and this is attributed by lack of training and inadequate supply of electricity.

In Nigeria, Tella et al. (2017) investigated electronic resources by academics staff by applying one way ANOVA and regression analysis with findings showing that there was perception (3.5%) on electronic resources which received less attention among academic staff. Similarly Thomas and Olegajo (2017) conducted a study in Nigeria on perception of ICT using regression analysis and found that among the teacher-trainees, there was less attention to ICT attributed to attitude (3.5%), perception (3.5%), self-efficacy (2.4%) and satisfaction (1.2%). Masele and Kagoya (2018) examined higher education in Tanzania and Uganda. For instance, Masele and Kagoya (2018) carried out a quantitative study both in Uganda and Tanzania with a focus on the relationship between ICT usage and health related snags by PhD students and grandaunts. Their findings indicated that ICT usage by PhD students during for long hours resulted into a number of health related hazards like eye defects, backache, headache, and others and needed attention

to be paid to ergonomic factors by University top managers, policy makers and students themselves. In adding literature to ICT and education, this study focuses on ICT usage in panellist sessions in relation to completion of PhD studies.

The reviewed literature on ICTs in education (Bello & Aderbigbe, 2014; Hamilton-Ekeke & Mbachu, 2015; Nkoyo & Nsata, 2016; Jumare et al., 2017; Tella et al., 2017; Falode et al., 2018; Agboola et al., 2018) show that most studies in Africa were conducted in Nigeria and focused on ICTs in education among undergraduates as opposed to PhD students. There are even fewer studies in Tanzania and Uganda (Masele & Kagoya, 2018; Mkwizu, 2018). In bridging the knowledge gap, this study compares Uganda and Tanzania by examining ICT usage in panelist sessions to enhance completion of PhD studies in public Universities.

.

METHODOLGY

The study locations for this paper are in Uganda and Tanzania. The public Universities selected for this study are Makerere University Business School in Kampala, Uganda and University of Dar es salaam Business School in Dar es Salaam, Tanzania. Cross-sectional design was adopted in order to collect quantitative data from the respondents. Convenience sampling was used and semi-structured questionnaires were handed to respondents. Data was collected during the month of March in 2019. The measurement for 7 items on information technology was adapted from a study by Mwai (2013) while the 6 items measuring successful completion of PhD studies were adapted from Akbulut, Kesim and Odabasi (2007) and UNESCO Institute for Statistics (2006). Collected data from 73 PhD students and panelists from Makerere University Business School in Kampala, Uganda and 49 PhD students and panelists from University of Dar es salaam Business School in Dar es Salaam, Tanzania were subjected to descriptive statistics assisted by SPSS version 20 while Partial Least Square Structural Equation Modelling (PLS- SEM) assisted by SmartPLS 3 was used to predict the influence of the tested variables. PLS-SEM can be used for predictions as per Hair, Hult, Ringle and Sarstedt (2014) and Ringle, Wende and Becker (2015). Composite Reliability for the variable of ICT usage in panelist sessions is 0.80 while completion of PhD studies is 0.78 for the Uganda collected data. On the other hand, composite reliability for the variable of ICT usage in panelist sessions is 0.74 while completion of PhD studies is 0.79 for the Tanzania collected data.

FINDINGS AND DISCUSSION

Findings from the sampled respondents revealed that majority of the respondents from Uganda were males (61.6%), between 26 to 35 years old (69.3%), and have university education (100%) while those respondents from Tanzania were mostly females (53.1%), between 36 to 45 years old (51%) and have university education (100%). This suggests that the majority of respondents in Tanzania were educated females between 36 to 45 years old compared to Uganda where the majority were educated males of middle age group.

The findings for the variable of ICT usage in panelist sessions showed that majority of respondents in Uganda as well as in Tanzania agreed with the statements that; the panelist should use recorders to capture comments during student presentation (Uganda – 65.8%; Tanzania- 93.7%); ICT encompasses wide variety of devices and applications that serve to ease and enhance efficiency during the panelist session (Uganda – 94.5%; Tanzania- 95.9%); ICT encompasses wide variety of devices and applications that serve to ease and enhance effectiveness during the panelist session (Uganda – 90.4%; Tanzania- 95.9%); It is important to use videos and recorders during student presentation (Uganda – 93.1%; Tanzania- 100%); ICT usage enables capturing, gathering, processing, storing, access and communication of information in different forms among the panelist and other stakeholders (Uganda – 99.6%; Tanzania- 100%); and ICT usage builds trust and fairness during presentations (Uganda – 86.3%; Tanzania- 93.8%). Further findings show that the opinions of majority of the respondents in Tanzania and Uganda indicated that the panel members do not use video cameras during student presentation (Uganda – 87.9%; Tanzania- 95.9%). The findings of this study suggest that video cameras during PhD presentations are not used by panel members in the panelist sessions for both universities in Tanzania and Uganda. The findings also imply that respondents from Uganda and Tanzania support that panelists should use recorders and other ICT devices to enhance efficiency and effectiveness during the panelist sessions hence the ability to capture, gather, process, store, access and communicate information in different forms among the panelist and other stakeholders. These results vary from Iroaganachi and Izuagbe (2018). The variation is due to the methodological approach whereby Iroaganachi and Izuagbe (2018) sampled only staff views and not PhD students.

Most of the respondents from Tanzania and Uganda who were asked about success in completion of PhD studies agreed that they will complete PhD studies in time if the panelists use ICTs (Uganda – 86.7%; Tanzania- 81.7%); lack of video cameras and ICT recorder in presentations affects PhD progress and the quality of PhD work (Uganda –

87.7%; Tanzania- 90.4%); Not using ICT recorder in presentations affects the quality of my PhD work (Uganda – 96.7%; Tanzania- 97.9%). Presence of videos and ICT recorders in the presentation room eases the work of secretary in recording comments from panelists and improves student time management (Uganda – 100%; Tanzania- 100%); and Presence and usage of ICTs reduces PhD student financial costs (Uganda – 97.3%; Tanzania- 95.9%). The results imply that most of the respondents agreed that the presence of videos and ICT recorders can ease and improve both the quality of PhD work and students time management. These results are not in line with Nkoyo and Nsata (2016) because this study reveals results which focused on ICT usage during panelist sessions as opposed to general usage of electronic resources by postgraduates.

Bootstrapping in PLS-SEM was the technique used for the analysis of predicting the relationship between ICT usage in panelist sessions and completion of PhD studies is shown in Figure 1 and Figure 2 for Uganda. The results for Uganda in Figure 1, show that the T-value (7.46) is above 1.96 and therefore, ICT usage in panelist sessions is a significant indicator as a predictor of success in completion of PhD studies and that in Figure 2, the p value (p=0.00) further shows that the relationship between ICT usage in panelist session and completion of PhD studies is significant. This suggests that ICT7 and ICT8 are the indicators of ICT usage in panelist sessions that predict success in completion of PhD studies in terms of CPS 13 and CP16. Other items were dropped due to low loadings.

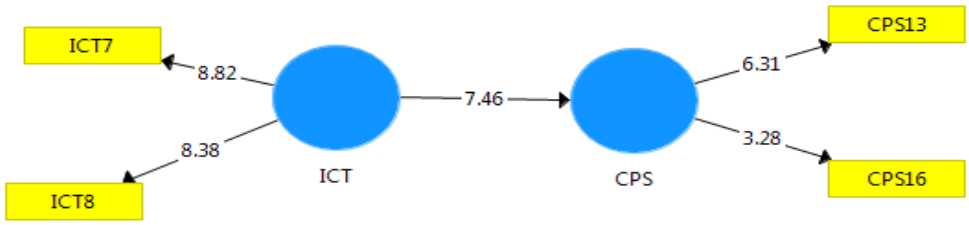

Figure 1: T values- ICT usage in panelist sessions and Success in Completion of PhD Studies (CPS) for Uganda

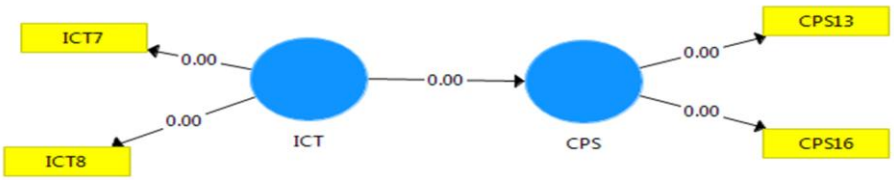

Fig **'s**

Bootstrapping in PLS-SEM was the technique used to analyze the prediction the relationship between ICT usage in panelist sessions and completion of PhD studies and the findings for Tanzania in Figure 3 show that the T-value (8.01) is above 1.96 and therefore, ICT usage in panelist sessions is a significant indicator as a predictor of success in completion of PhD studies. In Figure 4, the p value (p=0.00) further shows that the relationship between ICT usage in panelist session and completion of PhD studies is significant. This suggests that ICT7, ICT8 and ICT11 are the indicators in ICT usage in panelist sessions that predict success in completion of PhD studies in terms of CPS 13 and CP16. Other items were dropped due to low outer loadings.

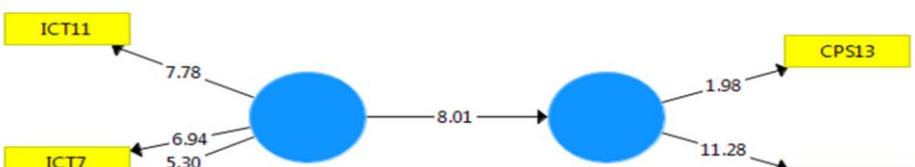

Figure 3: T values- ICT usage in panelist sessions on success in Completion of PhD Studies (CPS) for Tanzania.

The significant results of ICT usage in panelist sessions on success in completion of PhD studies for both Tanzania and Uganda support the UTAUT theory and therefore, ICT usage in panelist sessions predicts success in completion of PhD studies. These results are contrary to the study by Thomas and Olegajo (2017) in that the sampled respondents had low opinions on ICT whereas this study reveals that the respondents view on ICT usage in panelist sessions had high percentages and there is a significant relationship between ICT usage in panelist sessions and success in completion of PhD studies.

CONCLUSION

This paper examined ICT usage in panelist sessions to enhance completion of PhD studies. This paper can conclude that there is a significant relationship between ICT usage in panelist sessions and success in completion of PhD studies for both Tanzania and Uganda. The results showed that in Tanzania, the predictors of ICT usage in panelist sessions that influence success in completion of PhD studies are ICT encompasses wide variety of devices and applications that serve to ease and enhance efficiency during the panelist session; ICT encompasses wide variety of devices and applications that serve to ease and enhance effectiveness during the panelist session; and ICT usage builds trust and fairness during presentations in relation to lack of video cameras in presentations affects PhD progress and presence of videos in the presentation room improves on student time management. And for Uganda, the predictors of ICT usage in panelist sessions that influence success in completion of PhD studies are ICT encompasses wide variety of devices and applications that serve to ease and enhance efficiency during the panelist session; ICT encompasses wide variety of devices and applications that serve to ease and enhance effectiveness during the panelist session in relation to lack of video cameras in presentations affects PhD progress and presence of videos in the presentation room improves on student time management.

The significant results of this study support UTAUT theory and this implies that UTAUT theory can be used to examine the relationship between ICT usage in panelist sessions and success in completion of PhD studies in the context of comparing Tanzania and Uganda public Universities. Policy makers in the education sector can consider the predictors of ICT usage in panelist sessions for purposes of enhancing completion of PhD studies successfully in public Universities. Other researchers can apply a qualitative approach or mixed method to conduct a similar study in other Universities. They can also look at the moderating effects panelist mood in this similar study.

Selected Macro-Economic Variables And Residential House Prices In Nairobi County, Kenya

Margaret Kosgei (PHD)

Kenyatta University, Kenya

corresponding Author's email: kosgei.margaret@ku.ac.ke

ISBN 978-9966-132-53-6 @ Copy Right .2019

Abstract

House prices are not only a major point of economic and social debate in Kenya, but also in the whole world. They have been increasing in the country over the past decade and this is likely to continue in future. There are different factors that affect house prices, and their effect change over time. This study sought to determine the effect of selected macroeconomic variables on residential house prices in Nairobi City County, Kenya. The study was anchored on economic theory of demand and supply of houses. The study adopted an explanatory research design and covered the period 2004Q1 to 2016Q4. The House Price Index was obtained from the Hass Property Consult limited while those of the other variables were obtained from the Kenya National Bureau of Statistics. The results revealed that the short run effect of exchange rate and inflation rate on house prices were negative and significant. However, the previous quarter mortgage rates and housing prices had a positive and significant effect on house prices in the current quarter in Kenya in the short run. The speed of adjustment from short to long-run equilibrium is quick with 11.96 per cent of the disequilibrium corrected each quarter. The long run results showed that, mortgage rate and new houses had a negative and highly significant effect on house prices while exchange rate had a positive and significant effect on the house prices in Kenya. The study recommends that the government should put in place measures to curb inflation, maintain a stable exchange rate policy and increase budgetary allocation to housing to increase supply of houses hence check price of new houses.

Key words: ***House Price Index, House Prices, New Houses***

INTRODUCTION

Since the 2007/2008 global financial crisis, it is now widely acknowledged by empiricists and practioner's that the prices of houses play an important role in generation of business cycles and financial dynamics (Valadez, 2012; Shi & Jou, 2013). Davis and Heathcode (2003) asserts that house prices play a key role by leading the business cycle an assertion supported by Beltratti and Morana (2009) and Ghent and Owyang (2010). It also follows that house price fluctuations strengthen business cycles and that investment in houses leads the business cycle (IMF, 2009). The effect of house prices on business cycles is via aggregate expenditure and financial system (Tsatsaronis and Zhu 2004). Large cyclical variations in house prices have been witnessed in many industrialized nations, often having a price rise before a crash whereby investors lose out on their investments hence affecting their returns adversely (Nneji *et al.*, 2013).

According to Beltratti & Morana (2009), house price fluctuations affect economic growth strongly since housing is a major component of household wealth. House price changes affect the real side of the economy through affecting the financial system, a phenomenon associated with the US financial crisis of 2007-2008 (Kozicki, 2012). The volatility of house prices has similarly been documented in Africa. South Africa for instance, has witnessed a rapid appreciation in home values (Das *et al.*, 2011). Kenya in particular has registered significant house price changes within a short time. According to Hass consult report (2015), the average price for an apartment in Nairobi, the Kenya's capital city, increased from Ksh5.2M in December 2000 to Ksh11.58M in 2015. The report further asserts that no house in the formal market was below KSH 2M. However, exact statistics show that these houses traded at about KHS 14M in the first quarter of 2016.

The Kenyan housing market has attracted many investors, both individuals and institutional among them private developers who are seeking to diversify their portfolios (Hass consult, 2011). The revision of Kenya's National Housing Policy of 2004 led to increased attention to Nairobi County on addressing house supply shortfalls and slum upgrading initiatives. The real estate in Kenya has been experiencing a steady growth in the last decade and this is likely to continue in future (Knight Frank, 2014). Nevertheless, house demand outstrips supply by far. Although the country's Vision 2030 targets a supply of 200,000 housing units per year, only 35,000 are produced (CAHF, 2016)
Several factors have been documented as major determinants of housing prices, among them housing permits, number of households and total population being significant in Cyprus (Sivitanides, 2014). Others include the number of housing loans approved, (Pillaiyan, 2015); new construction of housing (Berglund, 2007); private consumption (Beltratti & Morana, 2009) and household consumption (Gustafson *et al.*, 2016). The long-run demographic changes in developed countries have been known to affect house price developments. Major housing stock contributors are; self-contracted houses, government agencies, public private partnership and private developers (CAHF, 2016). A positive relationship is expected between house prices and the quantity of houses supplied. (Miregi & Obere, 2014). Housing needs on the other side to include; construction of new houses to supply new households, replacement of units already in stock through demolition and construction of additional units required to relieve current overcrowding (Schiller, 2007).

Given this background, the current study sought to find out the effect of selected macroeconomic variables on housing prices in Nairobi. Specifically, the effect of the following variables was examined: mortgage rate, exchange rate, the number of new houses and inflation.

STATEMENT OF THE PROBLEM

Demand for housing, which has possibly led to increase in house prices, has been on the rise at a faster rate than the number of houses available or under construction (National Housing Corporation, 2009). National Housing Corporation (2009)noted that housing demand which is the likely force behind the house price hike witnessed has been increasing at a rate higher than the quantity of housing units available or those under construction. Expectations of capital gains from housing investments would affect house prices by increasing demand for housing which would cause high volatility in house prices (Selim, 2009). Annual housing units constructed is estimated at 30,000 against the annual demand of 200,000 units (National Housing Survey, 2013). According to Hass consult (2016), the average price of an apartment in Nairobi was KSH 11.58 in December 2016 from KSH 5.2 exactly 6 years earlier (December 2000) and no single home was valued at less than KSH 2M in the formal market. In particular the upward cycle has recorded a 14.6 per cent increase over the year, the first double digit annual growth rate since 2011 and a 2.26 times

since 2007.The 2011 report by World Bank acknowledges that Kenya has experienced a rapid growth in her housing finance system especially in recent past. This growth is majorly in the mortgage market and involves expansion on loans both in number and in their value. In the entire of Sub-Saharan Africa, Kenya's market for mortgages is ranked as third most developed with her mortgage asset estimated at around 2.5 percent of her GDP (World Bank, 2011a). In spite of the fact that the mortgage market is seen to be the most developed in Sub- Sahara Africa, access to mortgage finance for a majority of the population is still a major challenge.

Low supply of houses can be attributed to high construction costs, rural-urban migration, population growth, lack of resources and borrowing constraints (Tipple, 1994 & Matteo, 2005). Statistics show that 22 percent of Kenyans live in cities and that the urban population is growing at an annual rate of 4.2 percent. With this level of growth, 200,000 new houses are required every year to meet the demand (National Housing Survey, 2013; KNBS, 2016; CAHF, 2016). The appreciation of house prices in future as determined by expectations formed by households is fundamental as it tremendously drives the demand of houses (Coleman, 2008). It is for this reason that a speculative builder only construct houses based on demand (Tipple, 1994) which could be attributed to supply not matching demand. Empirical studies (Nneji *et al.*, 2013a; Valadez, 2012; Zhang *et al.*, 2012; Beltratti & Morana., 2010; Wadud *et al.*, 2012), have shown the impact of various determinants on the house prices.

The Kenyan market is unique and the drivers of house prices might not necessarily be replicated in another market. Changing house prices have been of concern to both individuals, investors and government since they influence affordability of houses. For instance Nneji and Ward (2013) found house prices to be responsive to changes in short term interest rate and GDP only which contradicts Zhang *et al.*, (2012) who found GDP not to be significant. The housing market in Kenya has been given relatively low research focus and those empirical studies on this sector have given much focus to factors that determine cost of house construction (Moko & Olima, 2014). Land, building materials and infrastructure were found to influence construction costs and that initiatives to reduce costs like Private-Public-Partnership, Government intervention and alternative building technology could be explored. Sila and Olweny (2014), found cost of land and interest rates being the main determinants of the cost of houses and no influence of building materials on cost of houses contradicting the study by Moko and Olima (2014). Expected income from real estate was found to influence prices in Meru Municipality (Messah & Kigige, 2011). Miregi and Obere (2014), in their study of fundamental variables and property prices using the unrestricted Vector Autoregressive (VAR) model, found that interest rates and inflation rates affect prices whereas building cost and stock prices had no significant effect.

Most buyers have little understanding of what really drives house prices, instead of using supply and demand information, they use the recent house price trends and project them forward (Shiller, 1989). The reviewed empirical literature have shown mixed results in different markets. Most of the studies have focused on one or two explanations by regressing a few variables and hence may suffer from 'missing variables' or 'variable selection biases'. This study filled this gap and complimented literature by evaluating the effect of selected macroeconomic variables in Nairobi City County, Kenya by running various estimation tests. The study also extended the model used by Miregi and Obere (2014). Adopting the unrestricted Vector Autoregressive (VAR) model, the researchers failed to conduct test for both long-run and short-run dynamics. This study used Vector Error Correction Model (VECM) to establish the short-run dynamic as well as long-run dynamics. In addition, the study also established the speed at which short-run equilibrium adjusts to the long-run equilibrium. This is a very timely study conducted at the time when the Kenyan government is committed to the big four agenda, one of them being Affordable Housing for all.

THEORITICAL REVIEW

The Economic Theory of Demand and Supply of Houses

The theory of demand and supply is of paramount importance in the analysis of the housing market. The theory suggests that in an uncontrolled economy, the interaction of market forces of demand and supply determines the price at which properties should be exchanged (Tsatsaronis & Zhu, 2004). The supply and demand is a cornerstone in pricing, it is therefore expected that supply will affect demand. House price movements are based on supply and demand curve and as more houses become available, prices will decrease (Shiller, 2007). The theory indicates that the quantity of houses supplied is a function of several factors among them the house prices. House prices is a function of demand factors among them; exchange rate, inflation, mortgage rate, population growth, household income, interest rates and household formations (Brueggerman & Fisher, 2005). Availability of credit could increase mortgage lending and stimulate housing demand (Goodhart & Hofmann, 2008). On the other hand, unexpected rise in interest rates that raises house costs would lower house demand, slow growth of house prices and possibly lead to a house price decline. (Himmelberg *et al.*, 2005b). Generally, as the housing market increase, the demand for a fixed good tends to increase yielding higher prices (Flem, 2014).

Supply factors in the housing market include construction costs, cost of land, labour, materials, improvement of the existing housing stocks and changes in housing stock (Tsatsaronis & Zhu, 2004). It is therefore expected that as the returns from houses increase, the suppliers of houses will seek to supply more whereas consumers seek satisfaction at minimal costs. Price and demand correlation concludes that with larger available quantities, prices tend to go down.

ISBN 978-9966-132-53-6 @ Copy Right .2019

An increase in the number of houses is regarded as an increase in quantity and is therefore regarded as having a negative effect on house prices (Schiller, 2007). The housing market is expected to have a continuous growth in supply due to a positive population growth. Constant price equilibrium is achieved when supply increases fulfil the demand increases. The Kenyan housing market is not regulated and players in the market among them real estate companies try to fulfil the demand for housing. Factors of demand in the housing market used in this study include; population, interest rate, inflation, exchange rate, gross domestic product and mortgage rate and supply factor being the number of houses. The interplay between these factors of demand and supply settle at an equilibrium price.

RESEARCH METHODOLOGY

The study adopted an explanatory research design. This is because it aimed at explaining the relationship between the explanatory variables and the housing prices. The study used secondary data which is appropriate for an explanatory research design. Various statistical tests were done on the data and the results to ensure robust results. These included unit root test and post estimation diagnostic tests.

Source of Data

Secondary data was collected for the entire period since January 2004 to December 2016. House price index data was obtained from the Hass Consult Limited while the other data were obtained from Kenya National Bureau of Statistics. This period was chosen on the basis of house price index data availability.

Data Analysis

The study adopted the vector autoregressive (VAR) model Sims (1980). In this model, all the variables are assumed to be simultaneous and are regressed on a given lags of themselves and all the other variables in the model. This specification is important in studying the joint behaviour of the variables. This is through giving empirical evidence of how various house price determinants respond to a shock in other variables.

Sims (1980); Kim and Lee (2000) and Ochieng & Obere (2014) used a similar methodology. The model is specified as follows:

$$HPIt = \beta 0 + HPIt - i + \beta 1\, EXCRt - i + \beta 2\, INFLRt - i + \beta 3\, MGRt - i + \beta 4\, NEWHSEt - i + \varepsilon_t$$

$$HPIt = \beta 0 + HPIt - 1 + \beta 1\, EXCRt - 1 + \beta 2\, INFLRt - 1 + \beta 3\, MGRt - 1 + \beta 4\, NEWHSEt - 1 + \varepsilon_t$$

……..... (1.1)

Where HPI_t is the house price index at time t while HPI_{t-i}, $EXCR_{t-i}$, $INFLR_{t-i}$, MGR_{t-i} and $NEWHSE_{t-i}$ represents the respective lagged house prices, exchange rate, inflation rate, mortgage rate and number of houses, i is the number of lags and the β's represents the coefficients whereas ε_t is a random error term.

The long and short-run relationship between the house prices and the explanatory variables was then modelled using VECM (Vector Error Correction Model). This model has two major advantages. First, it provides the explanation for short and long run house price behaviour (Wang *et al.,* 2008). Second, it treats all the variables in the model as simultaneous while linking every variable to its own and other variables lagged values (Tuluca *et al.,* 2000). VECM have been used by several other studies, including: Malpezzi (1999); Sing *et al.*, (2006); Gallin (2006) and Oikarinen (2009).

The model is specified as follows:

$$\Delta HPI_t = \beta_o + \varphi ECT_{t-1} + \sum_{i=1}^{p} \beta_1 \Delta HPI_{t-1} + \sum_{i=1}^{p} \beta_2 \Delta \mathrm{EXCR}_{t-1} + \sum_{i=1}^{p} \beta_3 \Delta \mathrm{INFLR}_{t-1} + \sum_{i=1}^{p} \beta_4 \Delta MGR_{t-1} + \sum_{i=1}^{p} \beta_5 \Delta NEWHSE_{t-1} + \varepsilon_t$$

……..... (1.2

ECT_{t-1} is the error correction term and it captures deviation from the long-run equilibrium path, φ is the correction coefficient and it shows how variables adjust towards their equilibrium.

DATA, ESTIMATION AND EMPIRICAL RESULT

Descriptive statistics

The summary of the statistical characteristics of all the variables are shown in Table 4.1

Table 4.1: Descriptive Statistics results for the variables

	HPI	**EXCR**	**INFLR**	**MGR**	**NEWHSE**
Mean	268.5872	82.07542	10.40818	15.04825	4401.615
Median	271.0754	80.65367	7.466667	14.67334	4696.875
Maximum	439.3879	102.9673	29.13333	20.14041	10825.53
Minimum	139.9944	62.64600	3.333333	9.089416	1597.469
Std. Dev.	92.30754	10.45918	6.317467	2.492063	2398.545
Skewness	0.076222	0.386904	1.369709	0.023712	0.746476
Kurtosis	1.771411	2.491350	4.458412	2.829427	2.861341
Jarque-Bera	3.320784	1.857923	20.86798	0.067912	4.870949
Probability	0.190064	0.394964	0.000029	0.966614	0.087556

Sum	13966.53	4267.922	541.2252	782.5087	228884.0
Sum Sq. Dev.	434554.8	5579.121	2035.430	316.7292	2.93E+08
Observations	52	52	52	52	52

Source: Researcher 2019

The data for all the variables is normally distributed because the mean and median are almost equal, skewness is close to zero and the *p* value of the Jarque-Bera test statistic is less than 0.05. However, inflation has a mean higher than median while new houses have a mean that is lower than the median.

Unit root tests

The study employed the Augmented Dickey- Fuller (ADF) as the standard test for unit root. This test is performed so as to avoid meaningless or nonsensical results (Gujarati, 2011). The unit root properties of the five variables was analysed at level and first difference using the ADF unit root test at both the intercept only and for intercept and trend and the results are as shown on the appendix, tables A.1 and A.2.

All the variables were non-stationary at level but stationary at first difference I (I) at five per cent significance level. As a result, this study used cointegration analysis. Since there was no cointegration, the study went ahead to use the VAR and VECM models for non-stationary data which analyse the data at first differences making them stationary and thus giving meaningful results.

Determination of Lag Length

Before a VAR model is estimated, appropriate lag intervals for the endogenous variables must first be determined. This is necessary so as to avoid the problem of over or under parameterization occasioned by inappropriate lag selection (Mahalik & Mallick, 2010 and Shahbaz, 2015). The lag length can be determined using Schwarz Information Criterion (SIC), Likelihood Ratio Test (LRT), Final Prediction Error (FPE), Akaike Information Criterion (AIC) and Hannan-Quinn Information Criterion (HQ). The lag length was selected based on the minimum of their values. The results of the lag length selection criteria are presented in table A.3.

From the findings on table A.3, LR, FPE, AIC and HQ selection criterion selects lag 2 while SC selects lag 1. The optimal lag length selected for this study was 2 based on the consensus between the LR, FPE, AIC and HQ lag length criterion. Besides, two lags were appropriate because they reduced the loss of degrees of freedom and minimised information criterion.

To confirm the stability of the VAR model with two lags a stability test using the AR roots table was carried out. The results are presented in figure A.1. From the results, the VAR is stable as all the roots lie inside the unit circle: The characteristic roots are less than one in absolute terms. A conclusion is made that VAR satisfies the stability condition.

Cointegration Test Results

Since all the variables were stationary at first difference but non-stationary at level, this study adopted Johansen's cointegration test as opposed to Engel- Granger's test to test whether the variables were cointegrated. Johansen's test has two major advantages as compared to Granger's test. One is the ability to test for a number of co integration vectors when the number of variable is greater than two and the joint procedure of testing the maximum likelihood estimation of the vector error correction model and long run equilibrium relationship. We accept the null hypothesis if $p<0.05$. The results of trace test are indicated in table A.3 below. From the findings in table A.3, the null hypothesis that there was no cointegrating equation was rejected since the p value was less than 0.05. The results indicate that the study had one cointegrating equation. The study therefore concluded that we have a stable long-run cointegration relationship between independent variables and house prices in Nairobi County, Kenya.

Vector Error Correction Model (VECM)

When co- integration among the variables exists, the error correction model (ECM) is used to model the short run dynamics. VECM requires that the variables be integrated of order one (I (1)) and cointegrated. Since the variables in this study met this condition then the coefficients were estimated using VECM approach. This approach was used to model both the short and long run relationship in this study. The short run VECM results are presented in tables A.4 and A.5, respectively.

Before the interpretations were done, various diagnostic tests were carried out. This includes tests of autocorrelation, heteroscedasticity and normality. The results are presented in the appendix, Tables A.6 and A.7, and figure A.2, respectively. The results show that the residuals were normally distributed, were homoscedastic and had no serial correlation.

The VECM short run estimates are presented in table A.5 and can be summarized in the following equation:

$$\begin{aligned}(\Delta\, LNHPI_t) = {} & 0.0107 + 0.8262\ (\Delta\mathrm{LN}HPI_{t-1}) \\ & - 0.3877\ (\Delta\mathrm{LN}HPI_{t-2}) + 0.1770(\Delta\mathrm{LN}EXCR_{t-1}) + 0.0858(\Delta\mathrm{LN}EXCR_{t-2}) \\ & + 0.0117(\Delta\mathrm{LN}INFR_{t-1}) + 0.0030(\Delta\mathrm{LN}INFR_{t-2}) - 0.0378(\Delta LNMGR_{t-1}) \\ & + 0.1096(\Delta LNMGR_{t-2}) - 0.0180(\Delta LNNEWHSE_{t-1}) + 0.0140(\Delta LNNEWHSE_{t-2}) \\ & - 0.1196 ECM_{t-1}\end{aligned}$$

The findings in table A.5 indicate that the R^2 is 0.545 suggesting that the error correction model fits the data

ISBN 978-9966-132-53-6 @ Copy Right .2019

reasonably well with about 55% of the variations of the dependent variable (HPI) taken into account by explanatory variables (EXCR, INFR, MGR and NEWHSE). The error correction term (ECM), which indicates the speed of adjustment has a value of -0.1196. It is correctly signed and statistically significant at 5 percent. This implies that 11.96 per cent of the disequilibrium is corrected each quarter. The negative sign is a confirmation of existence of equilibrium in long term. In addition, it is noted that the absolute value is less than unity; hence a confirmation of error correction mechanism to correct departures of short run equilibrium as it follows the long-term path to attain an equilibrium.

The short run coefficients in the VECM model showed the effects of the previous quarter values on the current quarter house prices. The results showed that the first and second lags of first difference of house prices, first lag of first difference of exchange rate and second lag of first difference of mortgage rate significantly affect the current house prices. The results however showed that in the short run, no significant relationship existed between mortgage rate and new houses with house prices at five percent significance level since all their *p* values were above 0.05. The results further showed that the previous quarter house prices had a positive and significant effect on current house prices in Kenya in the short run.

The results in the long run model in table A.4 and can be expressed in a summarized equation as:

$$LNHPI = -0.3440 + 0.0093LNINFRT - 0.6330LNMGR - 0.5640LNNEWHSE + 0.2627LNEXCHR$$

……..... (1.4)

These results show that in the long-run mortgage rate and new houses had a negative and significant effect on the house prices in at one percent level of significance. Further, the findings of the study showed that the effect of Exchange rate on house prices was positive and significant in the long run at five per cent significance level however, inflation rate showed no significant effect on house prices.

Discussion of Findings

Effect of previous House Prices on current House prices

The Vector Error Correction Model short run coefficient for house prices was significant for both the previous two periods at five percent level of significant with coefficients of 0.8262 and -0.3877. This indicates that in the short run a one percent increase in house prices in the previous quarter would lead to a 0.826 percent increase in current quarter house prices and a one percent increase in the house prices two periods behind would lead to a 0.3877 percent decrease in the current house prices. The interpretation of these results is traceable to the rational expectation hypothesis which portends that expectation of future house prices and other variables affect house prices in the short run (Muth, 1961).

ISBN 978-9966-132-53-6 @ Copy Right .2019

Effect of Mortgage Rate on House Prices

Long run coefficient for mortgage rate was -0.633 with a *p* value of 0.004 which indicated a negative and highly significant relationship existed between mortgage rate and house prices. This indicates that in the long run a one percent increase in mortgage rate would lead to decrease in house prices by approximately 0.6330 percent. The short run coefficients of the first and second lag of first difference of mortgage rate was -0.0378 and 0.1096 respectively and not statistically significant in influencing house prices in the short-run however in the long-run there was a negative and highly significant relationship. The study findings are consistent with those of (Brissimis and Vlassopoulous, 2007; Gimeno & Carrascal, 2010; Tsatsaronis & Zhu, 2004; Shi &Jou, 2013) who found a negative relationship between mortgage rate house prices in the long run.

Effect of Exchange Rate on House prices

The long run coefficient for exchange rate is 0.2627 which was significant at five per cent level of significance. This implied that a one percent increase in exchange rate in the long run would lead to 0.2627 percent increase in house prices. Short run dynamics indicate a coefficient of 0.1769 with a p value of 0.0640 for exchange rate variable in the previous quarter, which indicated a statistical significant effect at 10 percent level. This implied that in the short run a one percent increase in exchange rate in the previous quarter would lead to a 0.17 percent increase in the current quarter house prices. This therefore implied that in the short run exchange rate had a statistically positive relationship with house prices in the short run. These results are consistent with past studies that found a similar relationship, Liu & Hu, 2012 and Zhang *et al.,* 2012)

Effect of Number of New Houses on House Prices

The coefficient of new houses in the long run model was -0.563 with a p value of 0.0007 which was statistically significant at five percent level. This indicates that in the long run a one percent increase in new houses would lead to a 0.563 percent decrease in house price in the long run. This led to the rejection of the null hypothesis and the study concluded that there is a negative and significant relationship between new houses and house prices. The coefficient of new houses in the short run, was insignificant in explaining house prices in the first and second lagged periods. This meant that in the long run the number of new houses had a negative and significant effect on house prices with no effect in the short run. These results are consistent with those of Marsden, 2015; Leonhard, 2013 and Halket *et al.,* (2015) who found a negative relationship between number of houses and house prices. Marsden (2015) found a negative coefficient which was statistically significant and concluded that in the long-run, the inelastic supply of housing contributes to house price volatility.

Effect of Inflation on House Prices

The long run results for inflation indicate a coefficient of 0.0093 and is not statistically significant in influencing house prices. This study therefore concluded that there was no significant relationship between inflation and house

prices in the long-run. This led to the acceptance of null hypothesis and concluded that inflation had no significant effect on house prices. In the short run, the coefficients of first and second lag of inflation were 0.0117 and 0.0030 which were not statistically significant. These findings therefore indicated that there was no significant relationship between inflation and house prices in the short run.

CONCLUSION AND THE RECOMMENDATIONS OF THE STUDY

The study empirically examined determinants of house prices in Nairobi County, Kenya over the period 2004Q1-2016Q4 using a VAR and VECM models. The specific determinants examined were exchange rate, inflation, mortgage rate and new houses. This approach was chosen because of its ability to simultaneously study the effects of several variables affecting the housing prices.

The results revealed that the short run effects of exchange rate and inflation rate on house prices were negative and significant. However, the previous quarter mortgage rate and housing prices had a positive and significant effect on house prices in the current quarter in Kenya in the short run. The speed of adjustment coefficient was 0.1196, which means 11.96% is corrected in each quarter to eliminate disequilibrium. The long run results showed that inflation rate, mortgage rate, new houses, and exchange rate had a positive and significant effect the house prices in Kenya.

In a nutshell, mortgage rate, exchange rate, number of new houses and inflation play a key role in determining house prices in Nairobi County. The coefficient of mortgage rate was expected to be negative and highly significant in determining house prices in the short run, contrary to our expectations. This can be associated with the less developed mortgage market in Kenya. The findings of this study are consistent with rational expectations hypothesis which argues expected future prices and other demographic and macroeconomic variables affect current house prices.

RECOMMENDATIONS

The findings of this study will help the Kenyan government, through its selective credit control policy by the Central Bank of Kenya, to stimulate the growth of the housing market by channelling funds to the market. Based on expectation hypothesis, this growth in funds towards the housing market will increase mortgage uptake, increase supply of houses and in the end check the growth of house prices. The government can also provide appropriate housing finance products. It therefore follows that the mortgage finance markets should be restructured to capture the desire and expectations of house buyers of having affordable houses.

Kenya has had a steady currency depreciation making imported goods expensive which in turn is pushed forward to the final consumer in form of house prices via the building materials. In effect, higher housing material costs leads to reduced housing supply. To solve this problem, the Kenya government should come up with and enact a remittance policy that targets specific groups and give them incentives to use the monies received build affordable houses. This

can be achieved by creating policies that increase remittances inflows and directing them into national financial institutions that are geared towards promoting the housing market.

The Kenya government should develop policies that endeavour to increase supply of houses. For instance, the government should partner with key organizations like Shelter Afrique under the framework of public private partnership so as to ensure provision of houses in a bid to increase supply. The government has adopted the provider-based approach through the National Housing Corporation often acting as a social welfare agency to build houses for those sections of urban population who need or deserve special treatment like the civil servants and low-income groups as well the slum upgrading projects. This makes supply responses to be based on the fact that people need housing instead on the ability of housing investment to improve the economy. The government should also focus on housing as an investment and partner with international organization like World Bank and International Monetary Fund to provide housing as an investment channel. This can be coupled with tax incentives for those who construct the highest number of house units to increase supply.

Adoption Of Strategic Investment Drivers To The Growth Of Listed Firms At The Nairobi Securities Exchange, Kenya

Dr Mary Ragui,

Kenyatta University, Department of Business Administration

Email :drragui@gmail.com

Abstract

Over the past 7 years the number of companies listed on the NSE has stagnated at 64 companies as others lacks motivation to be listed. Currently, investors have a limited number of investments drivers in NSE to invest in. The current investments traded at the NSE are shares and bonds. The products limitation is forcing think tanks to look for unique products for NSE vibrancy and provision of the opportunity to diversify their portfolio. The study centered around four main strategic investment drivers that will be seen to be the most suitable in growth the NSE and these are:Real Estate Investment Trusts, Exchange Traded Funds, Shariah Compliant Products and Agro-Commodity Exchange. The theories anchored in the research included; Capital market theory, arbitrage pricing theory and modern portfolio theory. The research design was a descriptive study. The population comprised of listed companies who held securities in the NSE as at 31st December 2014. A census of the 64 listed firms in the NSE was conducted. The study used both primary and secondary data. The primary data was collected by use of a questionnaire. The secondary data was collected from finance journals, textbooks, and NSE sources. Data collected was analysed using descriptive statistics and inferential statistics. The study used chi square test because it was easy to compute and made no assumptions about the distribution of the population. The statistical package for the social sciences was used in the analysis as it is more user friendly. The study established that real estate investment trusts and sharia compliant

products were highly preferred as strategic investment drivers to the growth of listed firms at the Nairobi securities exchange. Exchange traded funds and agro commodities came third and fourth respectively as preferred strategic investment drivers to the growth of the Nairobi securities exchange. The study concluded that adoption of strategic investment vehicles such as real estate investment trusts, sharia compliant products, exchange traded funds and agro commodities will increase the number of listed firms at the Nairobi securities exchange. The study recommends;establishment of an agro-commodity exchange at the Nairobi securities exchange to provide a platform where agricultural products can be traded, introduction of a Real estate investment trusts to enable small investors to participate in the lucrative real estate sector and to encourage participation of various investors Sharia compliant products should be introduced to cater for the Muslim faithful's. Further research should be done on suitability of strategic investment drivers to institutional investors and how regional integration of exchanges would deepen the securities market activities.

1.0 Background And Research Gap

Over the past 7 years the number of companies listed on the NSE has stagnated at 64 companies mainly due to lack of sufficient government incentives to private owned SMEs companies to list on the exchange. Low growth in the exchange can also be attributed to lack of financial innovation by the NSE as the markets mainly concentrates on two products that is stocks and bonds. This limits the liquidity of the NSE and investors ability to diversify their exposures. For example the equity market turnover fell from Ksh.195.8 billion in 2008 to Ksh.76 billion in 2013 as the economy grappled with the double hit of political violence in the previous year and global economic recession. The drop in turnover was exacerbated further by foreign investors flight from frontier markets due to lack of safe haven investments at the NSE (Kantai, 2013).

There is need to develop more trading instruments other than stocks and bonds that will provide investors with the opportunity to diversify their portfolio while at the same time safeguard against volatility. High volatility has led most investors to invest their money in hard assets like real estate which is not offered by the NSE (Kagagi, 2009).This has led to the current property bubble in Kenya .This means that the NSE is not diversified enough and thus does not give investors strategies on where to invest their money. Thus the introduction of REITs (Real Estate Investment Trusts) will safeguard against this volatility.

Most potential investors are not catered for by the NSE. For example the 2009 census results revealed that Kenya has 4.3 million Muslims whose growth in their numbers coincides with a need for new investment products that target the faithful. But since the NSE does not offer Shariah Compliant products a lot of Muslims cannot participate in the NSE since the available products fail the structuring test of Islamic faith (Adam, 2010).

Reduction of interest rates in short-term investments have reduced capital market instruments demand. In the contrast, there has been substantial domestic savings in the government securities as a result of relatively better returns. This was particularly evident in 2010 when the treasury bill (t-bill) rate was at 9% compared to an inflation rate of 5%. This almost led to the government becoming monopoly of the securities market. To avert such a situation strategic investment vehicles need to be introduced at the NSE to deepen it. (CBK,2010).

The loss of Ksh.8 billion by 20,000 Kenyans to collapsed pyramid schemes can be attributed to lack of strategic investment options in Kenya. The NSE has been in existence since 1954, meaning that it has been in existence for over 60yrs and investors can put their trust in it.Investor education should then be initiated to make them aware of the benefits of investing with the NSE rather than with pyramid schemes. Once the NSE is diversified, investors will find it attractive to invest with the NSE(Abdullahi, 2007) .

1.1 Growth of the Nairobi Security Exchange

The NSE experienced phenomenal growth particularly in the period between 2009 and 2013. During this time the NSE index increased significantly from 2000 basis points in 2009 to over 6000 basis points in 2013.This growth explosion reflected the parallel growth of the economy, as it grew from a -0.3% in 2010 to over 7% in 2013, also due to renewed business confidence by both domestic and regional investors. Additionally, global investors following Standard and Poor's report, were attracted to Kenya. Being an internationally acclaimed rating agency, Standard and Poor's rated Kenya's foreign debt as investment grade B+ and Domestic debt as BB-. This attracted foreign pension funds to confidently invest in Kenyan equities and bonds (Mbaru, 2008).

NSE is by far the biggest and most liquid in the East African region with 64 listed companies which exceeds the combined number of listed firms as the Dar es Salaam Stock Exchange has 15 and Uganda stock exchange 12 companies.NSE 20 share index will be the best performing exchange in Africa with a gain of 24%, Nigeria index 20.6%, Egypt 10.41%, South Africa 3.2% and Ghana 5.55%. This can be accredited to high profits posted by a majority of the listed companies and high number of foreign investor participation (compared to other African countries) which increases NSE liquidity. Additionally, presence of many local investors in the market both institutional and retail adds to the size of NSE (Mwangi, 2010).

The NSE underwent demutualization (separation of ownership from management) in 2014. It is limited by shares with stock brokers and investment banks owning 40%, public shareholders 40% and Investor Compensation Fund 20%. Demutualization is aimed at improving the stock exchange corporate governance, boosting investors' confidence, deepening the capital market, eliminating government interference in the operation of the exchange and positioning Kenya as the financial hub for East and Central Africa (Agina, 2014).

Change in approach by the NSE players is necessary for its enhancement as a vehicle for mobilizing capital for development. The stock market must play an increasingly educational role to all the other actors at NSE including investors and government. On the other hand, Capital Market Authority (CMA) as the regulator needs to be more proactive and supportive for creation of enabling environment moving away from its heavy-handed type of control. This will assist in catalyzing development and not hindering the same through bureaucracy. (Kabuthu, 2010).

1.2 Strategic Investment Options

The NSE though, the most liquid market in East Africa is considered illiquid by international standards mainly due to lack of strategic investment options that can be used to deepen the market. Lack of strategic investment options is due to the bureaucratic processes by the CMA, which tend to slow down approval of new investment vehicles. In 2008 the NSE adopted the use of Central Depository System (CDS) to eliminate risks associated with the loss, mutilation and theft of certificates and paper based securities. This helped in boosting investors' confidence, speeding up operation and activities on the markets, and cutting down the cost of trading (NSE, 2009). International investment agencies such as Goldmans Sachs who have been analysing the growth of the NSE in the last decade have described the NSE's growth as being phenomenal.NSE can now be described as frontier market. This refers to a stock market with a huge growth potential, such that it is developing into an emerging market (Jones, 2014).

1.2.1 Real Estate Investment Trusts (REITs)

REITs is a strategy of investment adopted by fund managers who decides the kind of real estate investment to do. This is dictated by the amount raised by subscribers. The real estate investment vary from purchase of shopping centers, office buildings, hotel and mortgages secured by real estate.They are collective investment vehicles that buy and manage income property and mortgage loans and their shares at a stock exchange. REITS act as new investment vehicle for returns seekers and an innovative avenue for raising cash for housing projects(Rajan, 2013).

Kenya mortgage market faired poorly compared to other markets as its mortgage to GDP ratio stood at 2.5% compared to India's 6% and South Africa's 33%.This is mainly due to lack of innovative mortgage products to encourage penetration in low cost housing units in urban areas. REITs is the best way to open up the capital tied up in property to spur real estate development. (Gunseskera, 2013).

According to *Bansel et al* (2013) there are three types of REITs; Equity REITs whereby investors buy shares of the investment vehicle (investing firm) and get an annual income from the profit. Profit comes to the scheme in terms of escalation in real estate prices and lease rentals. Secondly Mortgage REITs: whereby investors lend money to owners and developers of real estate project or in financial instruments purchase which are in exchange secured by mortgage or real estate. Investors earn income inform of interest amount. Lastly Hybrid REITs which combine both the features of mortgage and equity REITs. They enable diversification of portfolio against the downturn in each category.

ISBN 978-9966-132-53-6 @ Copy Right .2019

1.2.2 **Exchange Traded Funds (ETFs)**

Shares are the EFTs listed and traded on stock exchange in an open-ended mutual fund structure. They offer low cost exposure therefore allowing investors gain a broad exposure to entire stock markets of different countries and specific sectors with relative ease. They are cheap to invest into and offers a real-time basis opportunity to trade. Additionally, they are traded throughout the trading day therefore different from other types of funds like mutual funds. (Ndegwa, 2012).

ETFs were established in 1993 by the state street Global Advisors at the American Stock Exchange. They named the product SPIDRERS (SPDR) after benchmarking against the NYSE $500 index. SPDR is an EFT which continues to be one of the most successful and liquid products in USA. American stock exchange in the US trades more in ETFs than it does in underlying stocks as approximately 60% of its volume comes from ETFs(Gaspirino, 2013).

ETFs can be used to tap into Kenya's mineral potential through trading at the NSE if it is well harnessed. For instance, Migori County's gold capacity stands at 34 tones that could earn the country close to Ksh.67 billion per annum (Mines and Geology Department, 2007). This in addition to other minerals like titanium could make minerals one of the country's top forex earners. If Migori belt alone has capacity to produce 1.2 million ounces, this can make Kenya a middle –level gold producer which can be traded as ETFs. (Goldpalt, 2013).

1.2.3 **Sharia Compliant Products**

Sharia compliant financial products are interest free products like loans, bills, bonds and bank deposits or any other transactions between a borrower and a lender. They must be consistent with the principle of the Sharia which prohibits payment or acceptance of interest (Riba). The principle advocates for Halal sources which are free from haram activities like alcohol, tobacco and gambling. These include businesses that can provide return on investment as long as their seed capital is not associated with bank borrowing or haram activities. Provision of goods and services such as manufacturing, trading, farming, professional services, foreign exchange, and information technology are considered to be clean businesses (Adam, 2010).

In Kenya, Muslim population have more than doubled in the past two decades. Following Sharia principle, the multitude have been sidelined by NSE since investment options offered are not Sharia complaint. They are therefore locked out from participation in the securities trading. Shariah-Compliant products have emerged as an strategic vehicle for mobilization and supply of finance to the Muslim faithful. Nathan (2010) argues that Islamic finance is the fastest growing segment in the global financial industry. This is reinforced by its ability to withstand international shocks such as the global financial crisis and therefore giving it an edge over other segments.

A Sukuk bond is an example of Sharia compliant commercial paper that generates a predetermined return that called a profit and not interest. With its maturity time determined in advance, it is tied to a specific asset for example a building, hospital or bridge and conveys ownership of it. It could be issued by a government or a company carrying out the project and the profits derived from the proceeds after completion of the asset is shared to the investors. This is Sharia compliant as no loan or interest is involved (Aden, 2013).

According to Satchu (2010), there is a potential market for Halal equities at the stock market where companies dealing with non-interest investments as their main source of income can trade their shares using a separate index for instance the agriculture stocks. Halal products are stirring to the mainstream and are also appealing to non-Muslim consumers looking for high quality ethical products, especially food and banking products. Halal economy is dominated by the food market in Kenya. However, financial services that comply with Islamic law and the teachings of the Koran are also gaining prominence.

The government plans to tap into Sharia compliant products by venturing in Sharia compliant bonds for the infrastructure building projects with an eye on increasing portfolio capital from the Gulf region. The gulf cash could open a window for Kenya to revamp its battered infrastructure including water, roads and power as investors keen on instruments that comply with Islamic law favor such investments. (CBK, 2010).

Since Sharia compliant product do not engage in imprudent risk taking and speculative activities investor's returns are shielded from volatility associated with most conventional investment products. Islamic finance does not allow excessive leveraging, imprudent risk taking and speculative activities.This ensures safety of investors' capital (Najmal, 2010).

1.2.4 **Agro-Commodity Futures Exchange**

Agro-commodity exchange is a market organised to allow for the selling and buying of agricultural commodities like maize, tea, coffee, wheat and cocoa. The goal of the agro-commodity exchange strategy would be to promote efficient markets and boost price discovery while enhancing risk management hence protecting local farmers. Kenya being an agricultural country, it could benefit from such arrangement for its products like maize, wheat, beans, barley, sugar and cotton. There could also be contract based farming on the same products sold at the exchange giving guarantee on market to farmers (Mbaru, 2009). According to KIPPRA (2010), agriculture contributes 60% of Kenya's economy employing 80% of its workforce hence the need for the government to establish an exchange to revamp agricultural production and development.

Mbaru (2009), insist on government need to develop institutional and legal framework for such arrangement to succeed. This could allow farmers to trade their produce through warehouse receipts and futures contracts making farming beneficial and attractive to many. Additionally, the framework will promote growth in the financial markets and provide a better opportunity to hedge against volatility of commodity prices**.** This concept is however not a novelty in Kenya as it dates back to the 1940s where the Nairobi Coffee Exchange (NCE) used the model. Additionally, Mombasa tea Auction which serves East Africa and parts of Southern Africa has also gained prominence as a major tea auctioneer and is already the second largest in the world after Colombo in Sri Lanka. The centralization and organization of the two exchange export platform has ensured effective competition among buyers and sellers making it worthy to imitate for other agricultural products at NSEs where regulation will be carried out to oversee trading practices while gathering and disseminating market place information. (Satchu, 2010).

1.3 Research Objective

The main objective of this study was to identify strategic investment drivers that can be adopted to promote growth of listed firms at the Nairobi securities exchange, Kenya. In specific, it sought to identify the effect of introduction of agro commodities, find out the role of real estate investment trusts (REITs), assess the effect of sharia compliant products, and discover the role of the introduction of exchange traded funds (ETFs) in the growth of listed firms at the Nairobi securities exchange.

2 Methodology

The research design used in this study was descriptive survey. The target population comprised of all 64 companies listed at the NSE as at 31st December 2014. A census was conducted on all the 64 companies because the population was small and would increase the accuracy of the research. Primary data was collected through the use of questionnaires with both closed and open-ended questions. Data collected was analyzed using descriptive statistics and inferential statistics. The study used chi square test because it was easy to compute and makes no assumptions about the distribution of the population.

3 Results And Discussion

3.1 Response Rate

Out of 64 questionnaires sent, 55 were returned making the response rate 86% which was deemed to be very good as per Mugenda and Mugenda (2003). Amongest the respondents, 56% were female while 44% were male. In addition, 36% of the respondents said they were in the range of 21 years to 30 years, 47% was 31to 40 years, 10% were 41 to 50 years, 7% were 51 to 60 years of age.

3.1.1 Key Descriptive Findings

3.1.1.1 Adoption of agro commodities as a strategic driver

The study sought to identify the effect of introduction of agro commodities in promoting growth of listed firms the Nairobi securities exchange. From the findings, 71% and 70% of the respondents strongly agreed they would invest in tea and coffee as agro commodities respectively. 84% strongly agreed that they had heard of agro commodities as a

strategic investment driver. From analysis on table 1, it shows that 89% of the respondents strongly agree that the adoption of agro commodities as a strategic investment driver will increase their return.

Table 1: **Analysis of agro commodities as strategic investment drivers**

	Strongly Agree	**Some what Agree**	**Neutral**	**Some what disagree**	**Strongly Disagree**	**Mean**	**Std. Dev.**
Would you invest in tea if it was introduced as an agro commodity?	39 71%	4 7%	5 9%	0	7 13%	4.19	1.45
Would you invest in coffee if it was introduced as an agro commodity?	38 70%	3 5%	3 5%	3 5%	8 15%	4.19	1.46
Have you heard about agro commodities as a strategic investment driver?	46 84%	4 7%	2 4%	1 2%	2 3%	1.31	0.88
Will establishment of an agro-commodity future exchange increase return of investors as well as revitalize agriculture in Kenya?	49 89%	4 7%	1 2%	0 0%	1 2%	1.16	0.61

3.1.1.2: Use of Real Estate Investment Trusts (REITs) as a Vehicle for Investment

The study sought to find out the role of real estate investment trusts (REITs) in the growth of listed firms the Nairobi securities exchange. On use of real estate investment trusts (REITs) as a vehicle for investment, 55% of the respondents indicated they had heard of real estate investment trusts as a strategic investment driver. Additionally, 58 % strongly agreed that liquidity and tax incentives would encourage more investors to invest in the capital markets and would also invest in real estate investment trusts. In addition, 53% strongly agreed they would invest in equity REITs while 54% agreed they would invest in hybrid REITs. The responses on specifics are as shown on table 2.

Table 2: **Real estate investment trusts as strategic investment drivers**

	Strongly Agree	**Some what Agree**	**Neutral**	**Some what disagree**	**Strongly Disagree**	**Mean**	**Std. Dev.**
Have you heard about REITs as a strategic investment driver?	30 55%	11 20%	5 9%	6 11%	3 5%	1.82	1.22
Will liquidity and tax incentive of a REIT, encourage more investors to participate in capital markets?	32 58%	14 25%	6 11%	2 4%	1 2%	1.58	0.92

Would you invest in REITs if they were to be introduced in the NSE?	32 58%	16 30%	3 5%	3 5%	1 2%	1.56	0.92
Would you invest in Equity REITs if they were to be introduced at the NSE?	29 53%	15 27%	4 7%	2 3%	5 10%	1.79	1.22
Would you invest in Mortgage REITs if they were to be introduced at the NSE?	27 49%	16 29%	5 9%	3 5%	4 8%	1.82	1.18

3.1.1.3 Adoption of Sharia complaint product as strategic investment drivers

The study sought to assess the effect of sharia compliant products in the growth of listed firms the Nairobi securities exchange. From the findings, 53% of the respondents strongly agreed that they had heard of Sharia compliant products. Additionally, 57% strongly agreed that the introduction of Sharia compliant products would encourage Muslims to invest in the Nairobi Securities Exchange. Moreover, 65% of the respondents somewhat agree that they would invest on Sharia compliant products if they were introduced as a strategic investment drivers while 65% of the respondents were neutral that they would invest in the sukuk bond if it was introduced in the Nairobi securities exchange. The specifics of these findings are shown on table 3.

Table 3: **Analysis of Sharia compliant products as strategic investment drivers**

	Strongly Agree	**Some what Agree**	**Neutral**	**Some what disagree**	**Strongly Disagree**	**Mean**	**Std. Dev.**
Have you heard about sharia compliant products?	29 53%	12 22%	2 4%	2 4%	10 17%	3.68	1.67
Will the introduction of shariah compliant product encourage Muslims to participate at the NSE?	31 57%	11 20%	4 7%	4 7%	5 9%	3.85	1.62

NSE?	21%	65%	7%	5%	2%		
Would you invest in sukuk bond if was to be introduced in the NSE?	3 5%	11 20%	35 65%	3 5%	3 5%	1.61	1.11

3.1.1.4 Adoption of exchange traded funds as strategic investment drivers

The study sought to discover the role of the introduction of exchange traded funds (ETFs) in the growth of listed firms the Nairobi securities exchange. On adoption of exchange traded funds as strategic investment drivers, 55% of the respondents somewhat agreed that they had heard about exchange traded funds as a strategic investment driver. Furthermore, 58% of respondents somewhat agreed that the introduction of exchange traded funds would increase investors returns at the Nairobi securities exchange. In addition, 58% were neutral that they would invest in exchange traded funds if they were introduced as a strategic investment drivers. Finally, 53% and 49% of the respondents strongly agreed that they would invest in the gold and other minerals respectively if they were introduced as exchange traded funds in the Nairobi securities exchange. The specifics are shown on table 4.

Table 4: **Analysis of exchange traded funds as strategic investment drivers**

	Strongly Agree	**Some what Agree**	**Neutral**	**Some what disagree**	**Strongly Disagree**	**Mean**	**Std. Dev.**
Have you heard about exchange traded funds as a strategic investment driver?	11 20%	30 55%	5 9%	6 11%	3 5%	1.82	1.22
Will establishment of exchange traded funds increase return of investors?	14 25%	32 58%	6 11%	2 4%	1 2%	1.58	0.92
Would you invest in exchange traded funds if they were to be introduced in the NSE?	3 5%	16 30%	32 58%	3 5%	1 2%	1.56	0.92
Would you invest in gold if it was introduced as an exchange traded funds?	29 53%	15 27%	4 7%	2 3%	5 10%	1.79	1.22
Would you invest in other minerals if they were introduced as exchange traded funds?	27 49%	16 29%	5 9%	3 5%	4 8%	1.82	1.18

3.1.2 Inferential Statistics

Chi-square tests were carried out to test the relationship between the independent variables and the dependent variable. These included agro-commodities, real estate investment trusts, sharia compliant products, and exchange traded funds. The findings of the same are elaborated below:

Ho_1: There is no relationship between agro commodities and the growth of listed firms at the Nairobi securities exchange, Kenya

	Value	Df	Asymp. Sig. (2-sided)
Pearson Chi-Square	7.800	1	.044

The Pearson Chi-square Value was 7.800, the larger the value the more likely the sample does not confirm to the expected frequencies and therefore we will reject the null hypothesis. The associated P- value (Asymptote Significant Value) was 0.044,this value is less than 0.05(5% level of significance) indicating that there is evidence against the null hypotheses and therefore we reject it(0.044<0.05). A conclusion can therefore be drawn that there is relationship between agro commodities and the growth of listed firms at the Nairobi securities exchange,Kenya.

Ho_2: There is no relationship between real estate investment trusts and the growth of listed firms at the Nairobi securities exchange, Kenya

	Value	df	Asymp. Sig. (2-sided)
Pearson Chi-Square	3.705	1	.023

The Pearson Chi-square Value was 3.705, the larger the value the more likely the sample does not confirm to the expected frequencies and therefore we will reject the null hypothesis. The associated P- value (Asymptote Significant Value) was 0.023. This value is less than 0.05(5% level of significance) indicating that there is evidence against the null hypotheses and therefore we reject it(0.023<0.05). A conclusion can therefore be drawn that there is relationship between real estate investment trusts and the growth of listed firms at the Nairobi securities exchange, Kenya.

Ho_3: There is no relationship between sharia compliant products and the growth of listed firms at the Nairobi securities exchange, Kenya

	Value	df	P-Value
Pearson Chi-Square	4.730	1	0.027

The calculated Pearson Chi-Square value is 4.73, the larger the value the more likely the sample does not confirm to the expected frequencies and therefore we will reject the null hypothesis. The associated P-Value (Asymptotic significance) is 0.027. This value is less than 0.05 (5% level of significance) indicating that there is evidence against the null hypotheses and therefore we reject it(0.027<0.05). A conclusion can be drawn from the study that there is relationship between sharia compliant products and the growth of listed firms at the Nairobi securities exchange, Kenya.

Ho_4: There is no relationship between exchange traded funds and the growth of listed firms at the Nairobi securities exchange, Kenya

Value	df	P-Value
6.501	1	0.0373

The Pearson Chi-square Value was 6.501, the larger the value the more likely the sample does not confirm to the expected frequencies and therefore we will reject the null hypothesis. The associated P- value (Asymptote Significant Value) was 0.0373. This value is less than 0.05 indicating that there is evidence against the null hypotheses and

therefore we reject it(0.0373<0.05). A conclusion can therefore be drawn that there is relationship between exchange traded funds and the growth of listed firms at the Nairobi securities exchange, Kenya.

4.0 Summary and Conclusions

The study established that real estate investment trusts(REITs) are the most favored strategic investment driver that should be adopted at the Nairobi Securities Exchange (NSE).This is mainly due to liquidity and robust growth that has been witnessed in the real estate market in Kenya. In conclusion, real estate investment trusts are strategic investment drivers that can adopt to promote growth of listed firms at the Nairobi securities exchange.

The study established that sharia compliant products were the second favored strategic investment driver that should be adopted at the Nairobi Securities Exchange (NSE). Sharia Complaint products will increase the number of Muslim listed firms in the Nairobi securities exchange .In addition ,the sukuk bond if well marketed will also increase the number of listed firms at the Nairobi securities exchange. In conclusion, sharia compliant products are strategic investment drivers that can adopted to promote growth of listed firms at the Nairobi securities exchange.

The study established that exchange traded funds were the third favored strategic investment driver that should be adopted at the Nairobi Securities Exchange (NSE). The exchange traded funds if adopted to the Nairobi securities exchange will increase the number of listed firms in the Nairobi securities exchange . In conclusion, exchange traded funds are strategic investment drivers that can adopted to promote growth of listed firms at the Nairobi securities exchange.

The study established that agro commodities were the fourth favored strategic investment driver that should be adopted at the Nairobi Securities Exchange (NSE). The introduction of an agro-commodity exchange is a good way for investors to gain from high food inflation being experienced across the globe hence offering a possibility of getting superior returns. In conclusion, agro commodities are strategic investment drivers that can adopted to promote growth of listed firms at the Nairobi securities exchange.

Specifically, the following conclusions were made based on the findings: Agro commodities and real estate investment trusts were the most favoured strategic investment drivers that can be adopted to promote growth of listed firms at the Nairobi securities exchange, Kenya. Most of the respondents were comfortable investing in them. Sharia complaint products were mainly favored by Muslim respondents and if adopted they would also increase the number of listed firms at the Nairobi securities exchange.Lastly,exchange traded funds were preferred by some respondents and they would also promote the growth of listed firms at the Nairobi securities exchange.Overall results indicate that if the solutions to the above research questions were implemented, it would lead to the growth of listed firms at the Nairobi Securities Exchange (NSE).

Based on the findings of this study the following recommendations are made to promote growth of listed firms at the Nairobi securities exchange, Kenya; Establishment of an agro-commodity exchange at the Nairobi securities exchange to provide a platform where agricultural products can be traded. Example cotton, wheat and maize. Introduction of a Real Estate Investment Trusts to enable small investors to participate in the lucrative real estate sector. To encourage participation of various investors Sharia compliant products should be introduced to cater for the faithful. For example Sukuk bonds and Sharia compliant mutual funds. Integration of the Nairobi securities exchange with the Dar es salaam securities exchange and Uganda securities exchange so as to promote exchange traded funds hence tap in the huge demand for financial securities.

While the findings of this research point out to various strategic investment drivers that can be adopted it cannot be said to be conclusive. Further research should be done on suitability of strategic investment drivers to institutional investors and how regional integration of exchanges would deepen the securities market activities.

Abstract

This study set to determine the extent to which demographic and business variables could determine entrepreneurial success in entrepreneurial ventures in Kenya. Many small businesses seek financial assistance to start and grow their business but most of these businesses fail within the first few years of start-up. This study used archival data from the records of two venture capital firms operating in Nairobi, Kenya. The target population consisted of 435 small and medium sized businesses in Nairobi's light manufacturing sector. The total sample consisted of 569 small business owner- managers who met the criteria of business ownership and, venture capitalist funding. Data were collected by use a questionnaire that captured fourteen biographical and sixteen business variables (Independent variables), and measures of success levels as the dependent variable. One-way Analyses of variance and Chi square tests were used to test for success differences in groups of participants (successful Vs. unsuccessful businesses). Bonferroni's ranges test was used to determine whether a relationship existed between success level and the relevant demographic and business variables. Stepwise Discriminant Analyses were carried out to determine how accurately subjects could be classified into the different levels of success categories. The results of the analyses show that personal and business factors such as amounts and number of loans taken, ethnicity/culture, economic sectors, entrepreneurial contribution, and education levels were more likely to determine success of the business. The study concludes that biographical and business variables hold some degree of success in predicting success or failure of a small business. Funding of small and medium-sized businesses should put into consideration variables that relate to the infrastructure of the entrepreneur's environment, specifically, system variables such as education and national economic factors, culture and policy.

Key words: ***Personal variables, business variables, Small businesses success varaibles***

Introduction

Small business development and entrepreneurship is a strategic theme for economic growth for the whole world (Wiklund & Delmar, 2013.The Small business sector has been identified and prioritized as a key growth driver for realization of the strategic development plans by the Government of Kenya, (GoK, 2018). Small and Medium Enterprises (SMEs) play a critical role in development and achievement of Kenya's visionary aims of transforming Kenya into an industrialized country, providing a high quality life to citizens by the year 2030. The Kenya government has encouraged financers to kick-start its bartered economy, by making entrepreneurship an important cornerstone in the country's economic revival (GoK, 2016). This strong interest in entrepreneurship is probably partly due to findings by Mong'are, (2017; Hunjira et.al (2018) that prove that new business enterprises are the primary source of new employment opportunities. With unemployment at high levels in Kenya, the interest in entrepreneurship as a way of creating jobs is understandable. Kiveu, Namusonge& Muathe (2018) and Harper (1991) argue that entrepreneurship has a critical role to play in economic development and that this role is even more important in the poorer nations of the world. Under these circumstances Carland (2012) argue strongly that understanding of entrepreneurship will be enhanced by studying the characteristics of entrepreneurs and the business environment.

Studies on the personality characteristics of entrepreneurs have not yet yielded a clear results (Umukoro, & Okurame,.(2017) A startling number of traits and characteristics have been attributed to the entrepreneur's psychological profile (Mokaya, Namusonge & Sikalieh,2012) Traits of the entrepreneur assembled from these studies portray the entrepreneur as someone larger than life, full of contradictions and conversely, someone so full of traits that he would have to be a sort of generic individual. Studying biographical variables as predictors of success of entrepreneurs has been criticized, it deems necessary that a combination of factors be used in the study of entrepreneurial success. It is generally agreed that entrepreneurship is a multiphase process consisting of entrepreneurial intent and opportunity search, discovery/recognition, evaluation, and exploitation (Eckhardt & Shane, 2003). In modeling the entrepreneurship success process, it is useful to distinguish between supply side factors, emphasized by psychologists, and demand side factors, emphasized by economists (Eckhardt & Shane, 2003).This is why this study combined the biographical variables and business variables in trying to predict the successes of the small business ventures.

Studying business variables as predictors of entrepreneurial success seems to be in line with Grooves,Vance & Choi [2011] view that the entrepreneurial process should be studied in more depth, such studies can assist governments andother development practitioners to avoid expensive interventions that produce minimal or no positive results.

Trying to predict business success therefore, seems to be a relevant research objective in the light of the high failure rate of entrepreneurial small businesses in the modern times. [GoK, 2018; 2016; Hunjira et.al (2018) Timmons, 1994].

The Research Problem

Small businesses are recognized as important drivers of economic growth, productivity, innovation and employment, and are widely accepted as key aspect of economic growth (Hisrich, 2014). However, many studies (world bank (2016b, Hunjira et,al 2018, Mongare,2017, Nafula, Namusonge & Muathe,2018) show that many small businesses fail to achieve growth and business success that is beneficial to the economic growth of nations. In Kenya there are several small business funding schemes that aim at stimulating business success but most small businesses seem not to benefit from such financial interventions. It was therefore necessary to determine whether biographical and business variables could be used as predictors of entrepreneurial success among the small business that had received outside funding.

The objective of this study was to determine whether biographical and business variables could predict success of small manufacturing businesses in Nairobi.

Methodology

The Population and sample

The sample consisted of 569 entrepreneurs active within 435 business enterprises in Nairobi's light manufacturing industries. These businesses had received funding from venture capital firm. Of the 569 respondents, 433 were male and 136 female. More than two thirds, i.e. 392, preferred to communicate in English, while 177 preferred Kiswahili. The majority of the respondents, i.e. 489, were Kenyan African citizens. The average age of subjects was 39.5 years with a standard deviation of 9.9 years and a range of 18-69 years.

Data collection Procedure

The data was obtained from the archives of a venture capitalist, operating with funding from government guarantee scheme and private sector sources. The firm was active in the Nairobi and its environs. The study was therefore described as one done on 'existing data'. The data was extracted directly from the archives of the venture capitalist firms by a research assistant who is familiar with small business financing.

The venture capitalist has six different financing schemes in operation in the whole of Kenya. Data from only three of these schemes was incorporated into this study. Data from the other three schemes had been omitted due to the absence of information on biographical characteristics of the individual to whom loans had been granted.

All loans granted between 1st June, 2012-31st May 2013 were included in the study. For analytical purposes this period was subdivided into loans granted during 12 month period. viz. 1 June, 2012-31 May, 2013 and 1 June 2013-31May 2014. The variables included into the study can be seen as a typical biographical variables as well as financial and other characteristics of the business venture for which loans had been granted. A list of the variables extracted from the archives is shown in table 1.

Archival data was captured for two cohorts representing the individuals to whom financial assistance was made available in a given financial year. Criterion data consisted of the standing of the entrepreneurs accounts respectively three and four years after loans had been granted. A statistical analysis strategy to limit capitalization on chance was implemented. In the case of variables measured at the ordinal and interval scale levels one-way analyses of variance with, where applicable, Bonferroni's ranges test specified were used to determine whether a relationship existed between success level and the relevant predictor variables. Chi-squared was used to test for such relationships when the predictor variables were measured on nominal scales. Stepwise Discriminant Analyses and Discriminant analyses were carried out to determine how accurately subjects could be classified into the different levels of success categories.

Table 1

Variables extracted from the files of the venture capitalist and scale categories

Biographical variables	**categories**
Ethnicity	Kenyan/ Non Kenyan
Language and preference	Kiswahili / English
Residential area	City/ Town / Rural
Education	Years
Number of dependents	Number
Sex	Male / Female
Nationality	Kenyan/ Others
Residential status	Citizen/ Non- citizen
Age	Years
Entrepreneurial history	Related to present venture/ Not related to venture/ Organization already exists
Apprenticeship experience	Completed/ Not completed/ None
Marital status	Single/ Married/ Divorced/ Widower
Criminal record	Yes/ No
Sequestration record	Yes/ No

Table 1 continued,

Business Variables	**Categories**
Economic Sector	Manufacturing/ Retail/ Wholesale/ Services/ construction /Foods
Purpose of Obtaining financing	Take-over / New business/ Expand existing business/ unknown
Number of loans	Number
Total amount borrowed	Numerical amount
Percentage own contribution	Ratio of own capital : Total capital of venture
Security over ratio	Ratio of amount of security: amount borrowed
Interest paid on loan	Rate of interest charged by venture capitalist
Legal form of venture	Sole proprietor/ Partnership/ / Company
Development state of venture	New/Existing/ New
Employment [Existing]	Number of employees
Employment [Additional]	Increase in number of employees since started
Classification of risks	Low/ Medium/ High/ Very high
Status of entrepreneur in Venture	Sole proprietor/ partner/ Member/ Shareholder
Entrepreneurs stake in the venture	Percentage of ownership
Class Variables	**Categories**
Year group	01/06/2012-31/05/2013 01/06/2013 -31/05/2014
Account status	Bad debt/Legal control/current account/paid up loan
Account number	As indicated by venture capitalist

The status of the accounts of the entrepreneurs in the venture capitalist's financial records approximately three and four years after the loans had been granted, served as criterion of success of the subjects' businesses (respectively for the two year groups). This was the measure of the dependent variable.

Measurement of Variables

The dependent variable which was success of the small business was measured by the following indicators of account status (a) Bad debts [BD], (b) Legal control [LC], (c) Current accounts [CA] and (d) Paid-up loans [PL]. For the

purpose of this study the first two [bad debts and legal control] were considered to indicate two levels of failure while levels three and four [current accounts and paid-up loans] were seen to depict two levels of business success.

The independent variables, the predictor variables-were biographical and business variables, they were measured by the following indicators; Education, ethnicity, nationality, entrepreneurs contribution, number of dependants, number and amounts of loans borrowed, economic sector, interest paid, security risks,

Data Analysis

One-way Analyses of Variance with Bonferonni's ranges test (specified where necessary) and Chi-squared (in the case of nominal variables) were carried out on all the biographical and business variables included in the study, with account status as indicator of dependent variable. These analyses were repeated with success/ failure (the dependent variable) of the businesses.

These analyses were followed by Stepwise Discriminant Analyses using STEPDISC of SAS [1985]. Only variables on which, according to the Analyses of variance and Chi-square Analyses differed on successful and unsuccessful criteria were included in Stepwise Discriminant Analyses. For the purposes of these analyses the variables measured on essentially nominal scales were treated as ordinal in character. More information on how this was done can be found in Schuttle (1992). Justification for including variables measured on scales which were not at the interval or ratio levels in Discriminant Analyses is found in Ker linger (1986).

Finally, using the DISCRIM procedure of SAS (1985), Discriminant Analyses were performed to predict success/ failure and account status, using only the predictor variables that had not been rejected by the analyses described up to now.

The Results

The aim of the data analysis was to determine whether the predictor variables by means of the available biographical and business variables could determine success or failure of a business (in terms of the two criteria employed in the study). This process was carried out in three phases; the first phase consisted of Analyses of Variance and Chi-squared calculations separately on the data of the two year groups and the total sample. The results of these [only for variables on which significant differences were found] as shown in table 2.

Table 2:

Results of one-way analyses of variance and Chi-squared analyses for account status success/ failure.

Risk classification		4.21	0.0414	ns	ns	ns	ns

The second phase of the data analysis consisted of using the STEPDISC procedure of SAS (1985) to determine, by means of Stepwise Discrimination Analysis, which of the variables identified as potential predictors in the first phase of the analysis could be retained as predictors in the two models, i.e., discriminating subjects into (1) account status and (2) success or failure of the subjects businesses. Significance levels for entry and removal of variables were set at 15- the default value of the programmer. The results of this analysis for the total group of subjects are shown in table 3.

Table 3

Results of stepwise discriminant analysis for classifying subjects into account status grouping for total group (n =569)

Predictor variable entered	**Partial R**	**F**	**p>F**	**Wilk's Lambda**	**Average canonical correlation**
Number of loans	,0379	741	,0001	,96	,0126

Education level	,0144	2703	,0449	,82	,0662

:p<,0001

The results shown in table 3 indicated that a relatively weak but statistically significant model could be developed for predicting the account status of the subjects. Eight predictor variables entered into the prediction at significant levels. Of these four were classified as biographical and four as business variables.The Stepwise Discrimination Analysis was repeated with the criterion being dichotomous, i.e. Success/ failure. Subjects businesses were regarded as successful when their account status was found to be either "paid up" of 'current". Failure was seen as all cases where the account status was either "under legal control" or "bad debt". The results of the Stepwise Discriminant Analysis on the data group are as shown in table 4.

P<, 001

As could be expected in the case of a dichotomous criterion the prediction model was less strong with only three predictor variables entering the model, and the values of Wilks Lambda and the canonical correlation indicating less strong predictions.

The Stepwise Discriminant analyses were repeated, separately for the data of the two chronological subsets, .i.e. subjects in year group one and for those subjects in the year group two.The results of this analysis for the 2012-2013 year group with account status as the dependent variable are seen in table 5.

Table 5

Results of Stepwise discriminant analysis predicting account status for 2012-2013 year group (n=240)

Predictor Variable entered	**Partial R**	**F**	**p>F**	**Wilks Lambda**	**Average canonical correlation**
Amount borrowed	,0793	677	,0002	,92	,0264
Economic sector	,0719	6,07	,0005	,85	,0499
Number of loans	,0521	4,29	,0057	,81	,0667
Race	,0531	4,36	,0052	,77	,0831
Number of dependents	,0408	3,29	,0215	,74	,0960
Educational level	,0364	2,91	,0356	,71	,1073

P<, 0002

Six variables entered into the model at the, 05 probability level, yielding a relatively weak but statistically significant prediction.

When the same analysis was done on the data of the year group one with the dependent variable being success/ failure the results shown in the table 6 were obtained. The variables that were more likely to predict business success were: the economic sector of operation, education level of the owner manager and the nationality of the owner manager.

Table 6

Results of Stepwise Discriminant analysis predicting success/failure for 2012-2013 year group (n=240)

Predictor variable entered	**Partial R**	**F**	**p>F**	**Wilks Lambda**	**Average canonical correlation**
Economic sector	,0395	9,796	,0020	,96	,0395
Educational level	,0417	10,322	,0015	,92	,0796
Nationality	,0171	4,105	,0439	,90	,0954

P<, 01

Again only three variables could, at a significant level, be entered into the prediction model yielding a relatively poor but statistically significant prediction. That is economic sector of operation, education level and nationality of the owner managers could predict business success. Other predictor variables are the number and amount of money borrowed, security risks, number of dependants were possible predictors of business success among loan borrowers.

Results of the same kind of analysis on the data of subjects in year group two with account status as the dependent variable are shown in table 7

Table 7

Results of Stepwise discriminant analysis predicting account status for 2013-2014 year group (n=329)

Predictor variable entered	**Partial R**	**F**	**p>F**	**Wilks Lambda**	**Average canonical correlation**
Number of loans	,0523	5,97	,0006	,95	,0174
Language preference	,0403	4,54	,0039	,91	,0308
Security cover	,0362	4,05	,0076	,88	,0426

P<, 0006

Three variables, some seen in other models too, entered the model at a significant level in this case. The level of prediction is again relatively weak but significant.

A final analysis in this series was to carry out a Stepwise Discriminant Analysis on the data of the subjects in the year group two trying to predict success/failure. The results of this analysis are shown in table 8.

Table 8

Results of Stepwise Discriminant analysis predicting success/failure for 2012-2013 year group (n=329)

Predictor variable entered	**Partial R**	**F**	**p>F**	**Wilks Lambda**	**Average canonical correlation**
Interest rate	,0158	5,233	,0228	,98	,0156
Nationality	,0126	4,169	,0420	,97	,0282

P<, 02

The results of the Stepwise Discriminant Analyses described up to this point are summarized in table 9.

Table 9

Summary of predictor variables with significant discrimination power for different groups and two criteria of success.

Criteria of success						
variables	Account status			Success/Failure		
	12-13	13-14	Total	12-13	13-14	Total
Number of Loans	*	*	*			
Nationality			*	*	*	*
Education Level	*		*	*		*
Economic sector	*		*	*		
Language preference		*	*			
Security cover		*	*			
Number of dependents	*		*			
Race	*					*
Amount borrowed	*					
Own contribution			*			
Interest rate					*	

*Significant prediction

To determine the strength of the prediction which could be obtained by means of the variables identified in the previous analyses, Discriminant Analyses using the DISCRIM procedure of SAS (1985) were carried out. In the Discriminant Analyses an attempt was made to predict the class (Group) into which subjects would be classified using their "scores" on the predictor variables identified by means of the previously described analyses.

The percentage of the subjects placed in the correct groups in terms of the two criteria by the Discriminant Analyses are shown in table 10

Table 10

Percentage of subjects on each of the four levels of account status and the two levels of success correctly categorized by discriminant analyses.

Groups	2012-2013	2013-2014	Total
Account status			
Bad debts	36.99%	00.00%	30.86%
Legal control	*	55.56%	54.55%
Current account	48.15%	33.13%	36.53%
Paid-up loans	38.10%	78.00%	46.74%
Success level			
Unsuccessful	63.33%	68.10%	62.14%
successful	62.00%	47.42%	46.83%

Conclusions

The results presented in the previous section seem to indicate that the use of biographical and business variables hold promise for improvement of the selection process used to decide on which small business owners should be funded by a venture capitalist

Variables which appeared as results of the three sets of analysis (the two year groups and the total group) as predictors of success or failure appear to be different with remarkably little overlap. Only number of loans granted and nationality of the entrepreneurs appeared as predictors in both year groups while these variables and security cover, education level, economic sector in which the business operated, number of dependents, language preference and race appeared as predictors in the total group and in at least one of the year groups.

The instability of the predictors over year groups can be due to inherit instability of biographical predictors, something which is in selection studies accepted as an established fact. A second reason could be differentiation in factors causing failure of entrepreneurial business over time. Timmons (1990) indicates that of new businesses started in the USA 40 per cent would have failed by the end of the first year of existence, with 60 per cent having failed after two years. This is a very high failure rate with many different causes and from a prediction point of view, probably a large number of different predictors. Greater stability of predictions can possibly be achieved by stretching the study over a longer time period.

The predictors which did appear seem to be quite different to what has been found in previous studies. Most of the 'traditional' biographical variables like age, gender, marital status failed to survive the elimination process used in the study (analyses of variance and Chi-square, stepwise Discriminant Analyses and Discriminant Analyses). In this sense the present study is seen to represent a contribution to the understanding of entrepreneurial personality.

Ethnicity is usually seen as the major characteristic of the Kenyan society. This variable did, however, not feature prominently as a predictor of success in the present study. This probably has important socio-economic and political implications for the development of the Kenyan society with its great problems e.g. unemployment among all population sectors. Culture may affect the supply of entrepreneurs by influencing preferences for entrepreneurship.

Implications of the study Results

The study results seem to indicate that use of the prediction models would decrease the percentage of individuals who are given loans but fail as small business owners. This would happen at the cost of eliminating [by not giving loans] a sizeable larger percentage of application than is the case when using the procedure currently employed by the venture capitalist.

The results shown in these tables seem, to indicate that the selection (prediction) models created by the analyses in this study would, if implemented, improve the selection of small business owners to be granted loans in the sense that fewer false acceptances [loans granted out but the business failed] would be found. The prediction model therefore seems to be more capable of eliminating failures than the selection model used by the venture capitalist. This obviously happens at the cost of, at the same time, eliminating some borrowers who would have been successful- the usual situation when a validated selection procedure is used.

Although the prediction models would decrease the percentage of individuals who are given loans but fail as small business owners at the cost of eliminating a larger percentage of applications it can be justified by the increase in ratio of the percentage valid versus false acceptances. The ratios are shown in table 14.

Table 14

Ratios obtained in the comparison of valid acceptances with false acceptances

	2012-2013	**2013-2014**	**Total**
Current procedure	1.67	1.83	1.76
Prediction model[account status]	2.39	2.06	2.25
Prediction model[success/failure]	2.81	2.72	2.18

From table 14 it can be seen that by using the prediction models a better" selection ratio" would be obtained than by implementing the current selection procedure

Study Limitations

The study has clear shortcomings. The criteria of success used are in many ways naïve and simplistic, due to the non-availability of information on, for instance, financial ratios. The study was essentially a concurrent validity study where an attempt was made to predict success of a small business owner on a selected group without taking into account that a number of applications had been rejected by the venture capitalist. Data from only three loan programs, albeit the largest three, operated by the venture capitalist was used, making the sample less representative of small business owners in the country. The problems regarding the short time period over which the study was done have already been indicated.

Recommendations for further Studies

Future studies should probably concentrate on creating an integrated picture of the characteristics {both personality and biographical} of the successful entrepreneur. Possible interrelationships between the predictive biographical variables should be included in such studies. Longitudinal studies stretching over longer periods are clearly called for.

Abstract

Recurrent observations on increased number of underperforming construction projects in informal settlements as evidenced by frequent collapsing of the buildings which has claimed the lives of people and destroyed their properties worth millions of money has attracted a lot of the studies on performance of construction projects. This paper examines the contribution of stakeholders' management on performance of the construction projects in informal settlement in Kenya. Specifically the paper focuses on effects of project clients, consultants and contractors management on performance of the construction projects. The study used a cross sectional design and targeted 412 completed and ongoing projects which had a workforce of 870 from which 30% was selected to form a sample size of

261 respondents. Stratified random sampling was used. Through drop and pick method, structured questionnaire was used to collect the data. Statistical Package for Social Science was used to analyse the data. The descriptive statistics indicated that the study variables were very important as indicated by high values of the mean and the low variations on the respondents opinion was shown a by low values of the standard deviation. There was a positive and significant correlation between clients, consultants, contractors management and the performance of the construction projects (r=0.872, p=0.005; r = 0.570, p=0.001; r=0.921, p=0.000 respectively). The study also found that project contractors have biggest role in determining project performance and client least influence with his/ her involvement being at planning stage only and little involvement during project implementation. The paper concludes that the importance of stakeholder management on the performance of projects cannot be underestimated. Construction projects need to consider various stakeholders interest while planning and implementing the projects and ensure they are engaged at all project stages. The relevant policies need to consider the stakeholders involvement as key in ensuring improved construction project performance.

Key Words: ***Stakeholder management, construction projects, project performance, informal settlement, client, consultant, contractors, Informal settlement.***

INTRODUCTION

Construction industry is a highly dynamic sector, and its operating environment, industry structures and product characteristics are changing at an ever-increasing pace (Dansoh, 2015). With the changing economic environment, managers of construction companies and projects look for emerging new construction management philosophies. Many organizations in various industries have turned to quality as a reliable management tool in the competitive market environment that leads to higher project performance. Performance measurement for big projects such as construction projects has been given different dimensions by different scholars. Toor and Ogunlana (2010) the tradition measure of project performance using iron triangle (on-time, under-budget and according to specifications) are no more applicable to measuring performance on large public sector development projects. This means there is a need to include other indicators of performance. In their study done in USA Seyed and Mehrdad (2012) on top of the iron triangle they also considered organizational objectives, stakeholders' satisfaction, customer benefits and future organizational potential as a measure of performance for construction projects. This study will consider the performance measures of construction projects according to Seyed and Mehrdad since they are comprehensive and look at wider views of the same.

A stakeholder is an individual or a group who can affect or is affected by the implementation of a change project (Mane & Patil, 2015). Laplume (2013) has categorized stakeholders as internal and external stakeholders. Internal stakeholders include owners, customers, employees and suppliers whereas external stakeholders include governments, competitors, consumer advocates, environmentalists, special interest groups, and the media. In the construction industry and within the communities surrounding each construction site, stakeholders are seen to include a variety of entities such as government and other non-profit organizations that directly or indirectly can provide support or resistance to the accomplishment of project objectives (Seyed and Mehrdad, 2012). Shiv (2015) indicated that for constructions projects, key stakeholders include client, contractors, project team, project managers, sponsor, consultant and government.

Stakeholder management is the process of managing the expectation of anyone that has an interest in a project or will be effected by its deliverables or outputs (Shiv, 2015). Scholars studying the construction sector (e.g. Cole, 2005; Olander and Landin, 2005; El-Gohary et al., 2006; Bosher et. al., 2007; Jing et. Al., 2010; Newcombe, 2013; Shiv, 2015) general common message is that stakeholder management is important to project outcomes and recognition of the concept of stakeholder management. According to Shiv (2015), the interactions and interrelationships between stakeholders largely determine the overall performance of a construction project, and have the crucial responsibility for delivering a project to successful completion. He added that for effective stakeholder management the key parameters include: proper identification of stakeholders through mapping and proper analysis to identify their needs, concerns, wants, common relationships and interfaces. This assist to position the stakeholders according to their level of influence, impact and enhancement they provide to the project.

Oliver and Rowlinson (2010) indicated that different project stakeholders perceive its success in different ways and proper management of them would increase the chances of project performance. Xiaojin and Huang (2006) reported that the engineers use "relation" among the key stakeholders as the most important criterion of project success. Jing et.al., (2016) indicated that the reasons why there is a big challenge in achieving the quality of construction project is due to poor record of stakeholder management owing to complexity and uncertainty in construction industry. A study related to the current study done by Newcombe (2013) looked at only contractor and client management and how they influence performance of the projects. In addition this study looked at theoretical approach ignore the empirical data,

one of the gaps to be filled by the current study. Many construction projects have been accused of having inadequate involvement of the key stakeholders at all level of the projects, having unclear milestone with timelines, lack of adherence to the set standards of specifications, time and budget as well as engagement of the project team who do not have minimum qualification in construction industry hence overreliance on the directive given by client and contractor (Loosemore 2012; Boulle, 2011; Oliver and Rowlinson, 2010). However, studies done by Jing et al. (2016) and Jergeas et. al., (2000) indicated that engineers in the construction projects are conversant with the projects outcomes and communicate with key stakeholders and set common goals to define the project success. From the news most construction projects have been accused to operate without the necessary approvals and documentations, an indicator of lack of adequate engagement of consultant and tendency to go for short cut. This study will shade some light on most of the areas where authors have differing findings hence filling the knowledge gap. The researcher assumes that by studying the influence of client, consultant and contractor management define performance of the construction project in the informal settlement in Kenya.

JUSTIFICATION

Despite of the government efforts towards ensuring quality standards in construction projects in terms of putting up construction policies, standards codes and formation of the government bodies like National Construction Authority (who have put a lot of effort travelling around the country to inspect building projects), a lot of cases have been reported regarding increased number of the substandard construction projects specifically in informal settlements which have claimed the lives of the inhabitants and destroying people's properties worth millions of money. Recently on various dates since the year 2006, reports of buildings collapsing have been reported in various counties highest number being in Nairobi and Kisii County. A very recent case is where a building in Huruma estate (one of the areas classified as informal) collapsed on 29th April, 2016, which affected over 150 people either by claiming their lives, or injuring them or living them without homes (Dansoh, 2015). The sub-standards buildings leading to collapsing of buildings have been reportedly attributed to among others; poor materials and workmanship, poor design and supervision, column failure due to bending, concrete not meeting the minimum strength for structural elements, lack of regular maintenance , non-approval of works, lacks of professional inputs during supervision among others. From the list, it is apparent that there is negligence from various project stakeholders which lead to attention on their management. Thus the researcher found a need to carry out a study on the influence of stakeholders management on the performance of construction project in informal settlement in Kenya.

Research Objective

1. To find out the effect of client management on the performance of construction projects in informal settlements in Kenya.
2. To find out the effect of project consultant management on the performance of construction projects in informal settlements in Kenya.
3. To find out the effect of project contractor management on the performance of construction projects in informal settlements in Kenya.

LITERATURE REVIEW

Theoretical Review

This study was anchored on shareholder value maximizing Theory as a tool for explaining construction firms' performance. The principle behind this theory states that managers of the firm or any organization should put the interest of the shareholders in fore front when making business decisions (Lazonick & O'Sullivan, 2010). In the context of the construction industry, the theory implies that serving the interest of all the stakeholders and meeting their expectations define the performance of the construction project.

Value drivers are used to define the various components parts which define the shareholder value in terms of minimizing the cost and time variance as well as optimizing the quality control (Lazonick & O'Sullivan, 2010). This means maximizing firm value is determined by how well the managers are able to manage the concerned variables putting the shareholders interest into consideration thus assurance of the better performance. This theory also recognizes the need to minimize controversial informational coming firm the principle (project client or financial) and the agents (contractor and consultant) so as to curb opportunistic behavior that may lead to losses or the results which may increase the construction risk (McSweeney, 2008).

Shareholder value theory was useful in this study since aspects of construction project performance are aimed at optimizing project performance so as to maximize the value delivered to the various stakeholders. Through cost and time minimization as well as meeting project specifications, a construction agent are able to complete the construction projects within the stated standards hence maximizing shareholder value of all stakeholders.

Empirical Review

Contribution of Client Management to Performance of Construction Projects

Clients are the projects owner who is the investor of the project and is responsible for all financial affairs. To the client, quality may be defined as one of the components that contributes to "value for money" (Bowen et. al., 2013). A study done by Seyed and Mehrdad (2012) indicated that the performance of the projects which indicates its success is heavily influenced by consultant performance. They added that this would be attributed by the fact that the owners are not, as expected, provided with the experts comparing to consultant companies in various fields, because consultants perform similar projects in other places and having experienced personnel's which is mandatory. Seyed and Mehrdad (2012) reported that, as the owner decide to implement his project, he hire a consultant company or companies to study, design and supervise the project. Mutua, Waiganjo and Oteyo (2014), argues that time, cost and quality are the principal feasible objectives of the client in any construction project. Bowen et al. (2013) argued that the clients of the construction industry are primarily concerned with quality, time and cost and yet the majority of construction projects are procured on the basis of only two of these parameters, namely time and cost.

In their study, Mutua, Waiganjo and Oteyo (2014), reported that the owner make the consultant company the single point of responsibility. So, the owner role in performing the project cannot be as manifest as the consultant. The clients of the construction industry are primarily concerned with quality, time and cost and yet the majority of construction projects are procured on the basis of only two of these parameters, namely time and cost (Bowen et al., 2013). This is understandable since the majority of project management control systems highlight time and cost, and overlook the relative importance of quality. On the other hand, clients have been increasingly concerned with the overall profitability of projects and the accountability of projects generally (Raceca, 2013). Cost overruns, in association with project delays, are frequently identified as one of the principal factors leading to the high cost of construction (Mane and Patil, 2015). Research to date has tended to focus on the technical aspects of managing costs on construction projects in the attainment of client objectives. There is little evidence in the published literature of a concern for the organizational, social and political problems that are inherent in the management of construction costs and the ability of the project team to meet the client's needs in terms of cost. Clients have been increasingly concerned with the overall profitability of projects and the accountability of projects generally. Bowen et al (2013) stated that to the client, quality may be defined as one of the components that contributes to "value for money"

Contribution of Project Management Consultants to Performance of Construction Projects

Project management consultant is an individual who take the responsibility of controlling the project from time, cost and quality and safety point of view (Seyed and Mehrdad, 2012). Ying et al (2009) state that project managers need to clearly understand the range of stakeholder reactions and behaviours. The attributes of stakeholders need to be assessed by project teams properly (Stephanie and Duffy, 2014; Boulle, 2011). Stephanie and Duffy (2014) as cited by Ying et al (2009) proposed three attributes in their study, namely, power, urgency, and legitimacy. Power means the ability to "control resources, create dependencies, and support the interests of some organization members or groups over others" .Boulle (2011) believe that successful project managers should have the ability to understand the "invisible power" among stakeholders. Legitimacy is "a generalized perception or assumption that the actions of an entity are desirable, proper, or appropriate within some socially constructed system of norms, values, beliefs, and definitions" (Laplume, 2013). Boulle (2011) considers the proximity as an important attribute of stakeholders, which can be rated from "directly working in the project" to "remote from the project". Analyzing and estimating these 3 attributes enhance the understanding of project managers on stakeholders. Project Management Institute (2013) has stated that the project manager is responsible and accountable for setting realistic and achievable boundaries for the project and to accomplish the project within the approved baselines.

As cited by Ying et al (2009), communication is essential for maintaining the support and commitment of all stakeholders especially for project managers (Nyandika & Ngugi, 2014). Effective, regular, and planned communication with all members of the project community is necessary for project success (Ying et al., 2009). In addition, Weiss, Hoegl and Gibbert (2014)believes project managers should be highly skilled negotiators and communicators capable of managing individual stakeholder's expectations and creating a positive culture change within the overall organization. Thus, pproject managers need to be attuned to the cultural, organisational and social environments surrounding projects. It is the role of the project managers to ensure project team work together to drive the performance of the project (Ying et al., 2009).

According to Vittal (2010), people-related project performance factors include: Create clarity in communication (defining project goals and likely project outcomes clearly and early in the project is critical, and failure to do so would lead identifying some of the project requirements as a later stage. This would cause changes to the project plan resulting in time and cost overruns); define roles and responsibilities(at the outset, defining roles and responsibilities

of project team members without ambiguity is imperative for improving performance and managing conflicts. This practice will lead to effective use of the project team members and help functional departments extend their support); communicate expectations (defining project outcomes and establishing what is expected from all the stakeholders will eventually eliminate perceived and actual incidences of not delivering expected results. This is specifically true with stakeholders within and outside the project who are not routinely involved with projects); employ consist process (developing and deploying consistent and formal project management process assist in improving ambiguity. Ultimately, these processes would lead to project management maturity); establish trust (an environment of trust is influenced by the organisational culture which promotes transparency and openness in their communications. Trust among the project team members to work cohesively would lead to knowledge sharing and collaboration); facilitate support (top management support translates into willingness of everyone in the organisation to support the project. Obtaining support is a challenge in traditional organisations where functional managers control resources); and manage outcomes (clearly defined project mission and objectives would help us develop a formal evaluation of project outcomes to determine project success. It promotes performance, motivation, recognition and synergy in teams).

Mutua, Waiganjo and Oteyo (2014) found that alternative dispute resolution mechanism is a very important device for project contracts towards ensuring better performance of the projects. This finding is supported by Pryke (2006) who treated projects as a network of relationships that need managing to achieve project success. In the construction sector, a number of studies have identified the importance of managing the interrelationships between parties within a project.

Contribution of Contractors' Management to Performance of Construction Projects

Project contractor is an individual (s) who performs and manages the project according to the bilateral signed contract (Shiv, 2015).According to Seyed and Mehrdad (2012), contractor perception of project success depends upon his achievement and therefore it is almost impossible to provide a list of success factors which can be influential to the projects, because they could be different from project to project. This indicates that for a given project clear definition and consensus on what define project performance for a particular one need to be provided. The main concerns of the contractual parties involved in the construction phase are main project management goals such as time, cost, quality, safety (Seyed and Mehrdad, 2012). They added that contractors have professional expertise which makes them more involved in determining project performance as compared to the project owners. While, contractors may be indicated by this study as being very influential in determining performance of the projects due to their expertise, they are also human beings who may be involved in unethical issues such as non-compliance to the set standards. For a given study to be more credited in relation to stakeholder management and its influence on the performance of the project, it would be prudence to not only look at their expertise part of contractors but also their ability to comply with the construction standards. Cleland and Ireland (2009) have stated that in a highly connected and competitive world, most projects must function in an environment that interacts with joint ventures, alliances, multinational sourcing, sub-contractors, and intricate vendor relations. Relationships with external organizations are managed through contracts. In general, companies provide services or products based on the results of direct contract negotiations with the client. One of the most important factors in preparing a proposal and estimating the cost and profit of a project is the type of contract expected. The confidence by which a bid is prepared is usually dependent on how much risk the contractor will incur through the contract. Certain types of contracts provide relief for the contractor since onerous risks exist (Nyandika & Ngugi, 2014). He further states that the size and experience of staff, urgency of completion, availability of qualified contractors, and other factors must be evaluated carefully during contract negotiations. The advantages and disadvantages of all basic contractual arrangements towards project performance must be recognized to select the optimum arrangement for a particular project.

According to Project Management Institute (2013), all legal contractual relationships generally fall into one of two broad families: either fixed-price or cost reimbursable. There is a third hybrid type commonly in use called time and materials contract. The fixed-price contract type is recommended, although some projects also prepare team contracts to define ground rules for the project. However, in practice it is not unusual to combine one or more types into a single contract document. Once the contract has been signed, both parties must meet their obligations under the contract. The contract administrator is responsible for compliance by the contractor to the buyer's contractual terms and conditions and to make sure that the final product of the project meets requirements. Project Management Institute (2013) further states that under fixed-price arrangement, buyers need to precisely specify the product or service being procured since changes in scope may only be accepted with an increase in contract price. Nyandika and Ngugi, (2014) argues that although a contract administrator is a member of the project team for reporting purposes, the contractor administrator could report to a line function such as legal department and may even be an attorney. In later stages of the project, a contract administrator is responsible for verification that all the work performed and deliverables produced are acceptable to the buyer. Contractual closure is then followed up with administrative project closure of the project or phase. The construction industry is moving towards higher quality, and contractors are forced to upgrade the quality of their services (Handfield, Primo and Valadares, 2015). Handfield, Primo and Valadares

(2015), emphasizes that a combination of sound formal systems and strong relationships is essential to achieve high quality in the project environment of construction, both within companies and across the supply network.

Conceptual Framework

The Conceptual Framework shows the relationships among the study variables. The independent variables are the client management, consultant management and the contractors' management while the dependent variable is the performance of the construction project in informal settlement in Kenya. These are shown diagrammatically in figure 2.1.

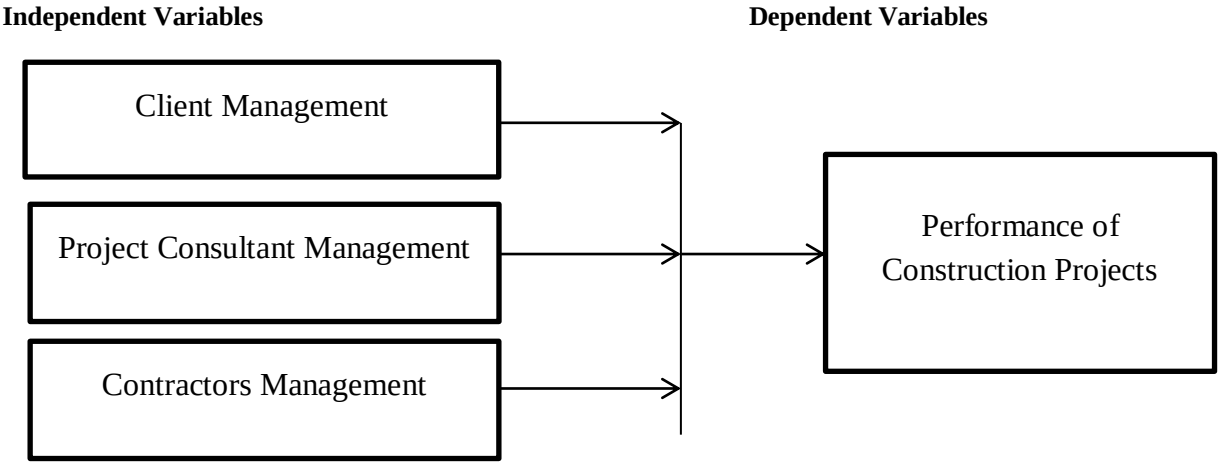

Figure 2.1: Conceptual Framework

METHODOLOGY OF THE STUDY

This study adopted ex post facto design to identify how various stakeholders' management affect performance of construction project in such a way that the researcher cannot manipulate the data (Kothari, 2008). The design involves use of the data which is available so as to explain the past events by identifying the extent to which the data relate to the events. The study was quantitative in nature so as to allow formal, objective and systematic inquiry about the events (Saunder, Lewis & Thornhill, 2007). The study target 412 building construction projects in located in various informal structure as follows:

Table 3.1 Target Population

Informal Settlement in Nairobi County	Number of Buildings under construction	Percentages (%)
Lang'ata	53	12.8
Makandara	78	18.6
Pumwani	36	8.6
Kasarani	45	10.7
Kibera	32	7.6
Embakasi	60	14.5
Central	62	11.1
Dagoretti	46	15.0
Total	412	100

Source: Ministry of Works Report (2018)

Building clients, contractors, community representatives, technical and inspectorial employees from building construction departments formed the key informants for the study which were five main groups. Each of the building construction project had one key client and one contractor hence a total of 412 clients and 412 contractors. There were 12 building inspectors and 18 technical employees. One chief and one sub chief were present in each area thus giving a total of 16 community representatives. This gave accessible population of 870 from which a 30% of the target population (Patton, 2002) was selected to form a sample size of 261.

Primary data was collected using the questionnaire method which was distributed through a drop and pick method. Ten participants who were not involved in the final study were used for pilot study. The results obtained were used to test validity and reliability. By use of experts ambiguous and incomplete questions were amended hence the validity.

Cronbach's alpha method used to test the reliability gave the values greater than 0.7 as shown in table 3.2 which indicated the instrument was reliable according to (Field, 2009).

Table 3.2: Reliability Test Results

Variable	No. of Items	α = Alpha	Comment
Client management	10	0.765	Acceptable
Project consultant management	10	0.782	Acceptable
Contractor management	10	0.821	Acceptable
Project Performance	10	0.809	Acceptable

Using the data from the pilot study Kolmogorov-Smirnov test gave a p-value of 0.52 was obtained indicating that the present of normal distribution. Multicollinearity was tested using the Variance Inflation Factors (VIF) and tolerance. All the tolerance values were greater than 0.1 while the values for VIF were less than 10. This indicated that explanatory variables lacked multicollinearity.
The data was analyzed using descriptive statistics including mean and standard deviation. To establish the strength of the relationship between study variables, Pearson's correlation coefficient was used. Multiple linear regression models was used to indicate the nature of the relationship between the study dependent and independent variables (Kothari, 2008). The study employed a 5% level of significant.
The empirical model used in the study was:

$$PP = \beta 0 + \beta 1CM + \beta 2PCM + \beta 3CoM + e$$

Where:

PP = dependent variable (Project Performance)
CM = independent variable (Client Management)
PCM = Independent Variable (Project Consultant Management)
CoM = Independent Variable (Contractor Management)
Bi (i=1,2,3) = Coefficient used to measure the sensitivity of the dependent variable (project performance) to a unit change in the corresponding independent variable)
e = Composite error term (the residual error of the regression)
β0 = The constant tem for each projects

Informed consent was sought prior to data collection. Confidentiality of the information was assured to the potential respondents. In addition, participant were not coerced to participate rather it was on voluntary basis.

RESULTS OF THE STUDY

From the 261 questionnaire distributed, 227 were returned forming a response rate of 87% which were taken as adequate for analysis. Demographic analysis indicated that 78% of the respondents were male and 22% were female an indicator of male dominated sector. In terms of age bracket majority 42% were aged between 25-35 years followed by 32% aged between 35-45 years. This finding shows a middle aged generation work in the construction industry. Analysis on education level, majority 38% had Diploma as their highest level of education, followed by 33% with first degree and 12% had master's degrees. The results indicate a work force which lack technical know-how of the construction project and highly depended on the directive given by the foreman or a contractor.

Descriptive Statistics

Descriptive statistics for the study variables including mean and standard deviations were obtained after running the data into SPSS Version 22. From the Likert scale questions asked the following means and standard deviations were obtained:

Table 4.1 Descriptive Statistics

Variable	**Mean**	**Std. Dev**
Client Management	3.7	1.2
Project consultant management	3.2	1.4
Contractors management	3.6	1.2
Project Performance	3.3	1.1

Table 4.1 shows that the mean for client management was 3.7; the mean for project consultant management was 3.2, that of contractor management was 3.6 and that for project performance was 3.3. Since the likert scale was of 5 this shows high values of the means showing that the study respondents perceived these variables as very important in the determination of the performance of the construction projects in the informal settlement in Kenya. Moreover, low values of standard deviation as shown in the table indicate respondents' low variation in their opinion of the study variables.

Correlation Analysis

To establish how the study variables are related, Pearson's correlation analysis was used. The test was at 0.05 significant level, one tailed test. The correlation matrix was obtained as shown in Table 4.2:

Table 4.2 Correlation Analysis

	Client Management	Project consultant management	Contractor management	Project performance
Client Management	1			
Project Consultant Management	0.207	1		
Contractor Management	0.302	0.212	1	
Project Performance	0.872	0.570	0.921	1

The matrix shows a weak positive correlation between client management and project consultant management of (0.207); weak positive correlation between contractor management and client management (0.302) and a weak positive correlation between project consultant management and contractor management. However the performance of construction project in the study area were found to be strongly positive correlated with client management (0.872), project consultant management (0.570) and contractor management (0.921). This correlation reaffirms the findings in the descriptive analysis that the study independent variables are critical in determining the performance of the construction projects.

Model Testing

In order to assess whether performance of the construction projects in informal settlement in Kenya is a function of the client, contractor and consultant management, multiple linear regression models was used. After running in the SPSS version 22 and at 5% significant level, the following results were obtained:

Table 4.3 Regression Model Summary

Model Summary				
Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	0.8965	0.8037	0.7632	0.8261

Predictors: (Constant), Client management, consultant management, contractor management

The goodness of fit value, indicted by the adjusted R squared, obtained was 0.8037. This value indicates that client management, consultant management and contractor management explain 80.37% of the variations in the performance of the construction projects in the informal settlement. The other 19.63% of the variations in the project performance can be explained by other variables not considered in this study.

Further to obtain the information in regard to the level of the variance within the regression model, ANOVA was conducted and the results are as in table 4.4.

Table 4.4 Summary of ANOVA[a]

Model		Sum of Squares	Df	Mean Square	F	Sig. (p-value)
1	Regression	1.543	4	0.386	14.8	.000[b]
	Residual	6.769	257	0.026		
	Total	8.312	261			

a. Dependent Variable
b. Predictors: (Constant), Client Management, Consultant management, contractor management.

Table 4.4 shows Analysis of Variance (ANOVA) results indicate that the overall model was statistically significant with ($p < 0.000$) and very strong F statistics of 14.8.

The regression coefficients for the individual variables are shown in table 4.5.

Table 4.5 Regression Coefficients

	Un Standardized Coefficients		Standardized Coefficients		
	B	Std. Error	Beta	t	Sig.
(Constant)	1.342	0.345		3.889	0.001
Client Management	0.213	0.043	0.142	4.953	0.005
Consultant management	0.115	0.045	0.121	2.556	0.001
Contractor management	0.089	0.031	0.139	2.871	0.000

The optimal model obtained may be given by:
PP = 1.342 + 0.213 CM + 0.115 PCM + 0.089 CoM
The results indicate that taking the study variables (clients' management, project consultant management and contractor management) constant, then the project performance of the construction projects in informal settlement will be 1.342 at 95% level of confidence. In addition, the regression analysis shows that a unit change in the client management, project consultant management and contractor management would increase project performance by 0.213, 0.115 and 0.089 units respectively. The Beta values indicate the extent to which the study predictor variables contribute to the model. The larger the value, the more the effect the independent variable has on the project performance. This means client management would have more effects on the construction project performance.
The t values shown in table 4.5 are all greater than the critical values for this study (1.708) thus the null hypotheses are rejected. Thus the predictor variables are statistically significant in explaining the performance of the construction projects. The results are affirmed by the p-values obtained which were all less than 0.05, which was study level of significant.

CONCLUSIONS

Project clients are very important in defining the parameters of the project performance. Clients can influence the direction of the projects at all the stages of the project. The study concludes that in most construction projects, clients are actively involved during the planning stage and least involved during the implementation stage of the construction project. However, it is apparent that involving client throughout the project would increase the chances of success of the project. This agrees with Mane and Patil (2015) stated that stakeholder management process would require development of the stakeholder map of the project, preparing a chart of specific stakeholders, identification of the stakes of stakeholders, preparation of the power versus stake grid, systematically conducting a process level stakeholders analysis, conducting a transactional level stakeholder analysis, determining the stakeholder manager capability of the research and development projects and finally analysing the dynamics of the stakeholder interactions.

The study indicated that project successful can be achieved by using consultant while defining human resources, planning and organizing the project as well as defining the integral part to the construction project. It was concluded that involvement of the consultant throughout the life cycle of the project lead to improved performance. Consultants in project represent views of the clients and ensure that quality standards have been adhered to by the contractor (Shiv, 2015). It can be concluded that most of the building construction drawings and specifications do not specify clearly the intentions of the designers. Discrepancies are found between different consultant's drawings, which have resulted in poor co-ordination during construction. In addition, most of the projects are constructed without all the necessary documentation and approvals and the consultants do not inspect the design, implementation and the construction work at large.

Contractor management is a key determinant of the project performance. This study conclude that poor performance in the construction projects has been associated with the misunderstanding between the clients and the contractors as well as poor workmanship by the contractors in completing the works results from low tender prices. Most building contractors employ the project team who lack the minimum qualification for construction work thus bringing about poor workmanship which can lead to collapsing of the construction projects. The results concur with Newcombe (2013) who said that contractors pay more attention to complete the works on schedule and control the costs to within budget than to achieving quality in construction.

RECOMMENDATIONS

The Government of Kenya should take bold steps to ensure that infrastructural construction projects are within the laid down policies and standards. The National Construction Authority should inspect all the buildings constructed especially in informal settlement and make sure all stakeholders in charge of buildings being constructed including clients, consultant, and contractors have all the required approvals and permits.

Government should ensure that they are in control of the type of building constructions taking place in various sections of the country. This would help to avoid in putting up buildings in prohibited areas such as swampy areas.

All the contractors should be vetted to make sure they meet the requirement before they are awarded the contract.

Administration Of Legal Issues In African Development For Global Sustainability

Ms. Moi Edna,
moi.edna@ku.ac.ke

Prof. Iravo Mike

miravo@jkuat.ac.ke

Prof. Minja David

Minja.david@ku.ac.ke

Abstract

Despite the evolution of legal systems in Africa, its development cannot be realized without the adaptation of global practices relevant to the 21st century complexities. Using data from Kenya, the objective of this paper is to determine people's awareness on legal issues, innovative tools in harnessing research and innovations for sustainability development. This paper also gives a brief history of government systems in various African countries which existed before as traditional carry progressive research and recommend ways of promoting legal rights. The paper highlights the administration of legal rights in Kenya citing new innovative tools for development. It submits ways that could be embraced for development; the technology system, the rule of law, constitutionalism, democracy and different stakeholders support for development. The conclusion shows that the most of the Kenyan citizens need legal awareness, the possible outcome of the process remains uncertain and open to estimation of stakeholders' inputs. It recommended the role of every stakeholder as there are hopes and expectations for Africa's development in global sustainability.

Keywords: ***Innovation, legal systems, Africa, participation, Development, Sustainability***

Introduction

Sustainable development is the process of meeting society's current needs without compromising future generations' ability to do the same; this means promoting economic development that does not deplete natural resources. As part of this effort, public administrators oversee the stewardship of lands through administration of legal rights, the notion that universities can contribute to regional innovation has been built upon two key ideas first universities increase knowledge production through the provision of new scholars and scientific results that can be turned into rights, products and services (Malmberg, 2008). Second the existence of universities in regions can lead to knowledge transfer and exchange. In various ways it is supposed that universities will contribute to building innovative regional economies. Governments generally can only manage the system indirectly by facilitating the generation of the necessary variety, influencing strategic directions, filling gaps in the system and encouraging citizen involvement. Societal or cultural innovations, such as new forms of citizen participation in decision-making, may well improve the viability of an innovation system. However, these innovations and public service reform should not pursue for societal rather than economic purposes (Fombad, 2013).

History and Government Systems in Africa

Angola changed from a one-party Marxist-Leninist system ruled by the Popular Movement for the Liberation of Angola (MPLA), in place since independence in 1975, to a multiparty democracy based on a new constitution adopted in 1992. Legislative power is vested in the President, the government and parliament. Angola provides a good example of public service reform in difficult circumstances. Political rights were widened as part of the 1991-92 reforms that instituted a multi-party system, and guaranteed freedom of association, assembly, speech, and of the press (Browning, R. 2011).

ISBN 978-9966-132-53-6 @ Copy Right .2019

Politics of Mozambique takes place in a framework of a semi-presidential representative democratic republic, whereby the President of Mozambique is head of state and head of government of a multi-party system. Legislative power is vested in both the government and the Assembly of the Republic. Mozambique has increased its poverty reduction efforts over the years. Its GDP has grown from $2,463 million in 1990 to $3,607 million in 2001, with annual growth rate reaching 13.9 per cent in 2001. The fast-growing sectors are services industry and agriculture.

In Cameroon, the African Charter for the Public Service serves as an inspiration for the adoption of innovative practices. To redeem the image of the Government has taken steps to introduce a National Anti-Corruption Plan which it set up an Ad-hoc anti-corruption Committee under the Office of the President. The Committee aggressively pursue the investigation of cases of corruption and impose sanctions and penalties for proven cases of corruption.

Tanzania has taken concrete measures to promote innovation by strengthening public service ethics and accountability. In fact, against the backdrop of the challenges associated with the transition from one-party rule to a multi-party competitive system, the issues of ethics and professionalism had engaged the attention of the Government prior to the adoption of the African(Tillier, 2013).

Public Service Charter, the adoption of the Charter in 2001, however, provided greater incentive towards the construction of an ethical infrastructure that meets the contemporary standards of good governance. Tanzania's response to on-going challenges began with the establishment of a legal framework within which to combat corruption and promote the cause of public service professionalism. Specifically, the Government enacted the Prevention of Corruption Act, the Public Service Act of 2002 and the Joint Negotiated Machinery Act that serves as a forum for ironing out labor-management differences. The inauguration of a Performance Management System further reinforced the actions taken in recent years to promote ethics and professionalism in the Tanzanian public service.

Other measures instituted in support of professionalism in the Tanzania public service are the
implementation of a major public sector reform programme, the establishment of appointments committees to screen the qualifications of candidates for vacancies and promote the cause of merit in the selection process, introduction of mechanisms for performance monitoring, implementation of performance-related remuneration as well as contributory health and pension schemes, and the involvement of external stakeholders in evaluating the impact and effectiveness of public services.

The Namibian public service's commitment to quality service began in earnest on the attainment of independence. In 1990, the Government enacted the Public Service commission Act which empowered the Commission to advise the President on issues of public service recruitment, remuneration, discipline, performance, and conduct, among others. This measure was further consolidated with the enactment of the Public Service Act of 1995. The Act bars public servants from engaging in other remunerative pursuits outside their public service employment without due authorization, that is the authorization of the Prime Minister (Sean, 2005).

South Africa has recorded one of the most impressive achievements in public service innovation in Africa. Guided by the slogan "Batho Pele" (meaning People First), the public service has implemented a variety of initiatives aimed at

responding to the needs of citizens and non-citizens alike. The Directory of Public Services published by the Department of Public Service and Administration is a testimony to the Government's concern for the welfare of South Africans and as well as of foreigners who come in daily contact with the public service(Mashood, 2010).

After gaining independence in 1964, Kenya had its first constitution in 1963 as a single party state. After, the Kenyan constitution had undergone successive reforms between 1963 to 1991. The most significant amendment being Act No 12 of 1991, repealing of Section 2A of the constitution ending the de jure one-party rule in Kenya, multiparty democracy and other electoral reforms. At that period there was a push for a new Constitution by civil societies, political parties and reforms aimed towards decentralizing power around the presidency.

Eventually, a new constitution was enacted in 2010. The August 2010 constitution, which came into force in 2013, made Kenya a two-wheeled devolved state. This is a devolved system of governance which seeks to enhance efficiency, effectiveness, accountability and transparency in the public sector. The new constitution was pivoted around the people and the impacts of the same on the common citizen epitomized by "*Wanjiku*". The type of government present is a Parliamentary dictatorship with a checked presidency and an ever flourishing judiciary with the government being accountable to the electorate through fellow arms of government. Overtime, legislative frameworks, systems, structures and measures have also been put in place in support of the espousal of the values and principles of the public service in line with the country's vision 2030. Establishment of Articles 10 National values and Principles of Governance, Article 73 Responsibility of Leadership, Chapter 13 The Public Service and Article 232 Values and Principles Public Service of the Constitution which emphases on the 10 thematic areas of High standards of professional ethics, devolution and power sharing, good governance, diversity management, economic resource use and sustainable development, equitable allocation of opportunities, accountability for improvements to service delivery, performance, management and public participation for policy making. Public institutions have put in place various policies and statutes to improve good governance in Kenya. *Mwongozo*, "code of governance for State Corporation" addresses matters ranging from effectiveness of boards, transparency and disclosure, accountability, risk management, Internal controls, ethical leadership and good corporate citizenship. One stop shops called Huduma service centers provide customer services to citizens from single location to facilitate ease of payment for government services (Heikki Ruismäki *et al* 2015).

Administration of Legal Rights in African Development today

Most African Governments have established high-powered anti-corruption bodies, and have strengthened the enforcement and monitoring mechanisms. Accountability is increasingly becoming a fact of public life. Among the measures specifically adopted to revitalize governance institutions in most African countries are the abolition of one-party rule and the legalization of multi-party competition, the organization and conduct of presidential and legislative elections, the enhancement of the policy analytic, budget review, and general oversight capacities of legislatures, the consolidation of the independence of the judiciary, and the empowerment of civic bodies to participate in the political process and to perform various policy promotion and watch-dog roles.

Public service reform is part of the efforts satisfying the growing demand for African Governments, to shift attention to the reform of the public service issues of competence, performance, and integrity of the public servants. The career service is gradually being reconfigured into a de-politicized and professional institution. This is due to Reform

Strategy to improve service delivery through decentralization, institutional restructuring by strengthening the policy formulation and monitoring process for capacity to enhance professionalism in the public sector. By improving financial management and accountability through promotion of good governance and combating corruption and change management (Barros, 2014)

New innovative tools in harnessing research and innovations for development

Post conflict and -crisis contexts must be carefully managed, starting as early as possible to avoid contemporary conflict in Africa and to ensure stability. The implementation of political agreements should be closely monitored, including clear benchmarks, because failures in this regard is a major reason for violent conflict re-igniting. It must be borne in mind that extremist ideologies, including ethnic exclusion, are fostered during violent conflict and remain a threat to peace even after agreements have been signed. Transitional justice processes usually do not investigate a whole range of unstated or unspeakable truths, such as economic crimes; external collaborators; and shady financiers of merchants of terror. The Western and eastern foreign capital interests that have fueled conflicts in Africa are never subject to international justice proceedings. Constructing good governance in Africa's development will be determined by some factors that could to be more realizable within the context of full adoption of technology, constitutionalism, rule of law and democracy as well as respect for human right.

Technology systems

Technology system has brought about Innovative Learning Environments, and has produced a sampling of the rich array of new visions for education around the world. Interactivity & Collaboration also demonstrate the increased interaction with technology while integration has long been a key area of concern in education. The intersection of technology with our rapidly transforming educational landscape is framing the nature of technology in education in profound, new ways while serving as catalysts for transformation and innovation for global awareness, creativity and collaborative problem-solving. Technology is an integral part to accessing the higher order competencies often referred to as 21st Century skills, which are also necessary to be productive in today's society. It can perform several key functions in the change process, including opening up new opportunities that improve teaching and learning particularly with the affordance of customization of learning to individual learner needs, which is highly supported by the learning institutions. This curbs the digital divide, and impact capacity to effectively operate and thrive in the new knowledge economy (Nardi, 2019)

Constitutionalism

Constitutionalism is very important as all power rests on the understanding that it will be exercised according to commonly accepted principles. Kameri, & Akech,(2011) asserted that natural law and any moralistic theory of constitutionalism must be a commitment to the law and rule of law. The evolution of democracy and good governance in Africa will require a re-adjustment of economic policies and priorities in Africa away from the present religious reliability to the fundamentalist ideology of the development.

Rule of law

Rule of law as a system of self-government in which the independent judiciary is respected, all persons, including the government, are accountable under the law and based on fair, publicized, broadly understood stable laws. The rule of law under the economic growth ensures that agreements between the private sector and the state are equitably

enforced minimizing instances of coercion and predatory behavior, and that institutional capacity, equity as well as predictability, transparency that is access to information on government processes and legality required for sustainable economic growth. There has to be a fair, robust, and accessible legal process in which rights and responsibilities based in law are evenly enforced. Contribute towards a just social order, through strengthening the rule of law. Transitional justice mechanisms have an important role to play in establishing or strengthening the rule of law and in transforming institutions and the social fabric. Because accountability and non-recurrence are objectives, effective transitional justice mechanisms need to go beyond the legal-judicial aspects to ensure a comprehensive approach that satisfies the people. Transitional justice mechanisms need to meet the basic minimum needs of accountability, including measures of non-recurrence, recognition of massacres committed and trustworthy compensation (Shivute, 2014).

Democracy

The ideology of democracy and equality had taken over center stage in the discussions of academicians. Democratic states should have a mechanism through which leaders consult and account to the citizenry. Participation by all members of the society is a key cornerstone of good governance. Participation could be either direct or through legitimate intermediate institutions or representatives-including public institutions and other elected public officers. It involves participation of both public and private sectors. Participation needs to be informed and organized. This means freedom of association and expression on the one hand and an organized civil society on the other hand (Kameri, & Akech, 2011).

Respect of human rights

Human capacity is critical to the success of reform as it needs to be commitment to reform to be shared by all stakeholders and should remain consistent over time though priorities vary from one stakeholder to another. Leadership in political and managerial is essential to the attainment of reform objectives. Effective management of the change process hinges on effective communication and equally effective management of expectations. The involvement of donors adds to the challenge of reform focus, and of change management and coordination. Differences in capacities and willingness to participate in the reform across ministries most frequently translate into uneven performance. It is therefore advisable to embark on a strategy that identifies and encourages likely ‘winners’ while not losing sight of those in need of special attention. Managers of public sector reform projects face the risk of concentrating too much on processes, and ignoring the more important issue of service delivery impact and outcome (Browning, 2011).

Methodology

The study employed descriptive analysis to test public awareness on knowledge of the law and their sources that guide legal frame work in their counties for development of projects.

Results

To improve the environment, every citizen should have access to participate in their country’s law formulation; thus, the government should take steps to ensure citizens are given every possibility of access and understand the

ISBN 978-9966-132-53-6 @ Copy Right .2019

constitutional provisions. (Figure 1) shows the public awareness of the legal frameworks that exist in Kenya. Lesson learnt from the study shows that most Kenyan citizens (89%) were not aware of any other legal framework apart from the constitution. While (56%) were aware of constitutional provisions. This implies that there is need to be empowered on the legal frame work. There will be no development in Africa if citizens will continue in ignorance. Capacity bridging and building and empowerment are an important factor in the legal systems. Knowledge and skills in the following, among other areas, are pertinent: development, peace building, nation and state building, consistency and coordination. Equipping actors across the range of key governmental and non-governmental partners, and not just among traditional legal partners and institutions, is beneficial. This also provides an opportunity to ensure that systems and structures are transformed for inclusiveness and equity, as well as ensuring citizen representation. Transitional legal framework should form part of an integrated peacebuilding framework that includes the engagement of all relevant actors locally and internationally for development.

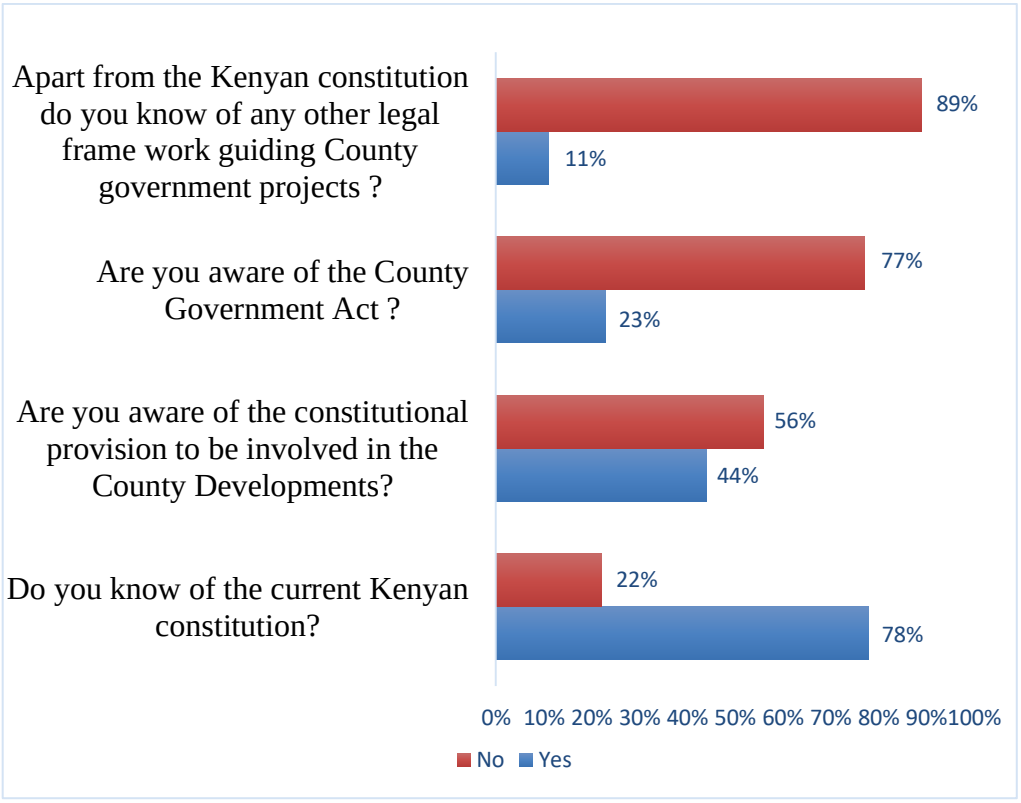

Figure 1: Legal framework in Elgeiyo Marakwet and Nandi County Kenya

Conclusion and recommendation

Although a lot of hopes and expectations are invested in the current process of capacity to promote good governance, the possible outcome of the process remains uncertain and open to estimation of stakeholders' inputs. Most of the Kenyan citizens were not aware of other legal frameworks hence calls for legal empowerment. The access to service of how soon and at what cost can the citizen expect to get speed/promptness of service, or simplicity of service procedure on number of decision layers and signatures required to obtain the service need to be well known.

For development partners

Without the requisite resources it is difficult to overcome the challenges to manage the crisis, facilitate early recovery, and thereafter for stabilization, peacebuilding and development. They opt to ensure that support builds local capacities and utilizes local resources. They also need to support transitional justice that is comprehensive, transformative and meets multiple needs and objectives. Investing resources in the conceptual and practical development of transitional justice and nation and state building as frameworks for prevention. These partners need to determine, prioritize and safeguard quotas within transitional justice funding and bear in mind that transitional justice, the transformation of relationships, systems and structures, and building social cohesion will take time and a heavy financial investment for the development and utilization of innovative ways to measuring progress.

For African governments

Sovereignty of African countries needs to be reasserted as a responsibility, not as a cover for tyranny or a leftover of the world order past. Transformation would be most effective when it starts with the individual, community and then state. Social cohesion and healing cannot be institutionalized or legislated. To achieve for instance goals by 2030, new modalities for development is required, including bringing innovation to the foreground of development projects. It is important to ensure that whatever method is adopted, it has local support, and is neither an external imposition nor a top-down national government initiative. The latter in particular may have the unwanted result of communities and existing in negative peace rather than transformed relationships.

The role of government is to create an enabling environment to facilitate these processes that must be driven by those affected, and to allow its members to get involved in their personal capacities as part of their personal journey towards healing. They have to reject amnesties for crimes of genocide, war crimes against humanity and gross violations of human rights. Support favorable national jurisdiction that comprises effective judicial mechanisms, laws and policies, which incorporate the national ownership of rule of law principles based on international norms. They should allow for measures of nation and state building to be incorporated into transformation and development efforts, so that states become more viable, thus reducing or eliminating risks associated with violent conflict. Create opportunities for more peer learning among the leaders of the continent; develop means of holding each other accountable and supporting each other; and establish a leadership mentoring system to identify and equip the next generation of leaders for smooth political transitions. Build and strengthen sub-regional, regional and continental capacities and universities that can provide external assistance that is context specific.

African governments must shoulder the primary responsibility of providing a business friendly environment and enacting reforms that are conducive for vibrant private sector growth. Thus it is imperative that these governments step up domestic resource mobilization efforts and make the right investments in education, skills training, infrastructure which are fundamentals for any competitiveness agenda.

For non-governmental organizations

They need to play an active and constructively critical role to ensure a transitional justice process is comprehensive, transformative, and meets multiple needs and objectives. To provide human resources and expertise to contribute to its objectives, for instance, knowledge and expertise in conflict prevention and transformation, peacebuilding, nation and state building, and trauma healing, in addition to traditional legal and rule of law expertise. They should play a dynamic accountability role to ensure that said mechanisms have local support, meet the needs. They actively engage

in coordinated, regular, systematic and structured conflict and context analysis as part of democracy and rule of law assessments, using tools that are context specific. Such as political exclusion and repression, state fragility and viability, conflict early warning signs, and disaster risk preparedness and reduction. As part of nation and state building efforts work towards the parallel transformation of civil society along similar principles and to contribute to more viable states.

Abstract

The purpose of this study is to determine the effect of employee retention strategies and organizational performance of the Judiciary of Kenya, a case of employees based in Nairobi County. Specifically, the study sought: to determine how employee compensation, job security, employee training and development and employee motivation affects performance of the Judiciary of Kenya. The study employed a descriptive survey research design through which primary data was collected from 286 employees of the Judiciary of Kenya based in Nairobi. Quantitative data was analyzed using both descriptive and inferential statistics. The R^2 for the overall model was 0.844 an indication that the four variables of the study explained up to 84.4%of performance of Judiciary in Nairobi. There should be a study to therefore unveil the other factors contributing to performance of state corporations that make the 15.6% remainder.

Key words: ***Employee Retention, Strategies, Organizational Performance, Judiciary, employee training and development***

Introduction

The successful performance of any organization depends on its human resources, its technology and the type of materials it has. Technology and materials need the human touch and hands to make an organization perform effectively and efficiently (Bula, 2012). Different strategies have been adopted by various firms to attract and retain competitive employees. Some studies mention six strategies which include; compensation, training, work life balance, good work environment, career advancement and communication. We have various forms of compensation such as profit sharing, stock ownership or gain sharing that firms can give to their employees as a show of recognition of their work and performance (Smith & Rupp, 2004). Armstrong, (2006), observes that employee retention can be termed as how organizations retain their employees from leaving the organization.

Therefore, organizations should come up with retention strategies to ensure that employees remain in the company. Kalliath and Beck, (2001), have attempted to answer the question of what really drives people's intention to quit or stay. Unfortunately, up to-date, the findings are somehow different. Also, having an extensive training and development program offered to employees in organizations is beneficial to both parties. This is because when employees undergo extensive training they build up on their skills and increase their knowledge which makes them committed to the organization as they get the opportunity to advance and grow. The organization in return, benefits from having skilled employees which creates a competitive advantage for them in the market as well as increasing their performance (Smith & Rupp, 2004).

Having a work life balance has been seen to have an impact on retaining staff as it helps employees to have a balance between work and family life. This has helped employees to reduce pressure on them and end up increasing their performance at work.Organizations that practice career advancement of their employees and give them promotions due to their performances end up retaining their employees as their career growths are reached and are satisfied with their jobs. Firms should take precautions from having their employees leaving in search for better employment elsewhere. To have effective retention strategies in the organization, the rate of employee turnover should be ascertained, causes of the turnover to be identified and then retention strategies are to be developed and practiced (Ghosh, Satywadi, & Joshi, 2013).

Public Organizations in Kenya have been affected by a mass movement of employees in search of better terms and working conditions. Omolo (2008) noted that many doctors and nurses were leaving public corporations for the private sector because of better terms of employment. They further acknowledged that more trained doctors and nurses were leaving the country for better remuneration and working conditions in other countries like South Africa and Ghana. In the transport sector, Kenya Airways has lost its well-trained pilots and cabin crew to competitors both internationally and locally based on pay and working conditions (Mumero, 2012). The need for employee retention was also recognized by the Judiciary of Kenya. The current organizational structure is highly centralized and concentrated.

The Judiciary's organizational structure is convoluted in form and outlook thus impairing quality decision making and location of authority and responsibility (Judiciary, 2017).The Judiciary thus went ahead to form various reforms to include; The Judiciary Transformation Framework, 2012 – 2016 that has a representative from the Tribunals; one representative from the Kenya Magistrates and Judges Association (KMJA), Kenya Judicial Staff Association (KJSA), and one representative each from the Directorates and Registrars, and states that these members was the principal management organ of the entire Judiciary. The Judicial Service Commission (JSC) will play its constitutionally and statutorily defined oversight role (Judiciary, 2012).

In so far as competent employees are necessary for organizational performance, there is the need therefore to identify and examine how best to retain these competent employees for the achievement of the goals and objectives of organizations. The objective of this study therefore is to empirically examine the relationship between employee retention strategies and organizational performance of the Judiciary of Kenya.

1.2 Statement of the Problem

Employee Retention is one of the imperative issues within competitive organizations today as employees are the most valuable assets in any organization. Beheshtifar and Nazarian (2013) noted employees who do not feel connected exhibited dissatisfaction through withdrawal behaviors such as a reduction in productivity, absenteeism, low employee morale, and high turnover rates. Sometimes, employees in organizations do not always feel their organization tackles poor performance appropriately – a hard nut to crack. Dealing with poor performance is an emotive issue and it is perhaps not surprising, therefore, that many organizations fail to address it. An organization's culture and overall financial performance have the potential to influence employees to stay or leave an organization (Beheshtifar & Nazarian, 2013). People learn by focusing attention on role models to determine appropriate behaviors and attitudes. Individuals want to affiliate with members of similar cultures (Kaplan, Wiley, & Maertz, 2011). Noble (2009) states that more attention should be paid in identifying and dealing with working environment because when employees have a negative perception of their environment, they sometimes suffer from chronic stress. Working environment means the processes, systems, structures, tools or conditions in the workplace that impact favorably or unfavorably to individual performance. The working environment also includes policies, rules, culture, resources, working relationships, work location, internal and external environmental factors, all of which influence the ways that an employee performs their job functions. The turnover of employees has been increasing in various organizations in Kenya and this occurrence has undermined effective and efficient service delivery; a pointer to employee commitment and retention policies at these firms (Njiru, 2008). Employees are now more knowledgeable and demanding. Avery, Volpone, McKay, King, & Wilson (2012), noted that tardiness and absenteeism of full-time employees resulted in productivity losses costing organizations around $200 to $700 per employee missed workday. Organizations lose an average of $47,000 when replacing each employee with 2 years' tenure or more, and approximately $9,000 per year replacing each first-year employee (Avery et al., 2012). This study will seek to establish factors influencing employee retention in the Judiciary of Kenya in Nairobi.

1.3 Objectives of the study

The main objective of this study was to examine the effects of employee retention strategies in the Judiciary of Kenya in Nairobi.

1.3.1 Specific objectives

The study was guided by the following specific objectives:

i. To determine the effect of employee compensation on the performance of the Judiciary of Kenya.
ii. To examine the effect of employee job security on performance of the Judiciary of Kenya.
iii. To assess the effect of employee training and development on performance of the Judiciary of Kenya.
iv. To evaluate the effect of employee motivation on performance of the Judiciary of Kenya.

Scope of the Study

For this study, the target population scope was 1000 employees based in Nairobi region and not the entire 5,800 due to limited resources and time factor. A sample size of 286 was selected from the 1000. The specific sample size adopted for this study included include 19 judges,17 magistrates and 250 other employees (Latham, 2007). The study was conducted in the month of November 2018.

The study focuses on the Judiciary of Kenya employees based in Nairobi, Kenya. As per the Judiciary's Human Resource Report of 2015, the Judiciary had approximately 5,800 employees with 1000 employees based in Nairobi region. The variables to guide this study will include employee compensation; employee job security; training and development; employee motivation to guide the independent variable while performance was the guide for the dependence variable.

The study was anchored on two theories: Hierarchy of needs and goal setting theories

Hierarchy of Needs

Hierarchy of needs theory theorizes human motivation as arranged in steps or levels(Maslow 1934).Maslow posits that there are five (5) levels and these are physiological security,
belonging, esteem and the need for self-actualization.

Goal Setting Theory
This study was anchored on: job embeddedness theory and Herzberg's two factortheory.According toMitchell, Lee & Kay (2001) job embeddedness posits that employees remain in the organization if the incentives to stay match their expectations or exceed them.
Job embedding influences the decision of the employee to stay or leave the company.
Organizations should ensure their employees are embedded in the workplace as this will prevent the individual from leaving the company resulting in retention of employees.

2.1 Literature Review

It is the employees who keep the organization running and ensure that the organizational objectives and goals are achieved (Slocum & Hellriegel, 2009). To this end, workers attitude and feelings towards their job should be of utmost concern to any management. A lot of empirical studies agree that employee job satisfaction is a function of employees' work motivation element such as compensation, training, working conditions, and training. Studies have been done in relation to employee retention. Agwu (2014) studied organizational culture and employee's performance in the National agency for food and drugs administration and control in Nigeria.

2.2 Study Variables

For this study the dependent variable was performance while the independent variable is employee retention strategies. Thus, factors influencing employees' retention strategies are dependent on performances of employees in organizations. On the other hand, other parameters that influence employees' retention strategies include; Job Security related factors, employees' compensation related factors, and other factors.

3.0 Research Methodology
The research used descriptive survey as the research design. The study was concerned with finding out employee retention strategies and their performance in the Judiciary of Kenya.The survey design generally entails the collection of data from members of a population with respect to one or more variables (Mugenda & Mugenda, 2003). For the purposes of the study, the design enabled the researcher to study employee retention strategies in the Judiciary of Kenya. Through the survey, the researcher was able to describe and explain collected data from first hand information rather than predict.

Target population refers to a complete set of individuals, cases or objects with some common observable characteristics (Mugenda & Mugenda, 2003.The target population for the study consisted of 1000 employees of the Judiciary of Kenya based in Nairobi (as identified from the Human Resource Department at the Milimani Courts in Upper Hill, 2015).

A questionnaire was used as an instrument to collect data from the respondents in the study site with the aid of a questionnaire which was pre-tested prior to its use in the field. The selection of these tools was guided by the nature of data being collected, the time available as well as the objectives of the study. The overall aim of the study was to explore the role of employee retention strategies and organizational performance of the Judiciary in Nairobi, Kenya. The researcher was mainly concerned with views, observations, perceptions, and attitudes of respondents. Such information could be best collected using the questionnaire technique. The sample size of the study was 286 employees of the Judiciary of Kenya based in Nairobi region.

Validity refers to the extent to which an instrument measures what is supposed to be measured. Data need not only be reliable but also true and accurate. If a measurement is valid, it is also reliable (Joppe, 2000). A pilot study was conducted to test the reliability and validity of the research.

The pilot test consisted of 3 Judges. The validity content of the data collection tools was determined by discussing the questions stated in the pilot interview guide with the managers. Validity was determined by the use of Content Validity Index (C.V.I). C.V.I of between 0.6 and 1 shows the instruments to be valid for the study (Orodho, 2003). Reliability refers to the consistency, stability, or dependability of the data. Whenever an investigator measures a variable, he or she wants to be sure that the measurement provides dependable and consistent results (Cooper & Schindler, 2003). To measure the reliability of the data collection instruments, an internal consistency technique using Cronbach's alpha was applied to the gathered data (Mugenda&Mugenda, 2003).

The sample size consisted of 286 respondents. A stratified sampling technique produces estimates of overall population parameters with greater precision and ensures a more representative sample is derived from a relatively homogeneous population (Latham, 2007). The study sample size was 286 which was guided by Yamane (1973).

Yamane (1973) provides a classical simplified formula for calculating sample size. A 95% confidence level and p = 0.05 are assumed for the formula.

$$n = \frac{N}{\{1 + N(e^2)\}}$$

Where:

n = sample size

N = population size

4.0 Effect of Employee compensation on the Organizational Performance of judiciary in Kenya

The first objective of the study was to establish the effect of employee compensation on the organizational performance of the Judiciary in Nairobi. The respondents were presented with Likert-type statements aimed at responding to this objective. The findings obtained are presented in Table 4.1.

Table 4.1: Effect of employee compensation on the Organizational Performance

Statement	**Mean**	**Std. Deviation**
I feel that what I offer the judiciary is consume rate to what I am paid.	4.4706	.81697
The judiciary offers a wide range of rewards to employees.	4.6176	.58095
The judiciary hires Competent/skilled employees.	4.3333	.80016
Qualified applicants are offered equal chances of being employed at the judiciary of Kenya.	3.9902	.58859
There is clear communication of duties and responsibilities to recruited employees of the judiciary	4.2451	.83768
Employees are left to work in the manner they want	4.0490	.81298
Employees are empowered to make decisions pertaining the organizations success	4.4510	.73965

According to the study findings respondents strongly agreed that what they offer the Judiciary is consume rate to what they are paid as shown by a mean value of 4.4706 and standard deviation of 0.81697. Majority of the respondents agreed that the Judiciary offers a wide range of rewards to employees as shown by a mean value of 4.6176 and standard deviation value of 0.58095. The respondents were in agreement that the Judiciary hires competent/skilled employees as shown by a mean value of 4.3333 and standard deviation value of 0.80016. Results indicated that majority of the respondents agreed that Qualified applicants are offered equal chances of being employed at the Judiciary of Kenya as shown by a mean of 3.9902 and standard deviation of 0.58859. The results established that majority of the respondents agreed that there is clear communication of duties and responsibilities to recruited employees of the Judiciary as shown by mean value of 4.2451 and standard deviation value of .83768. Further, the respondents agreed that employees are left to work in the manner they want as shown by a mean value of 4.0490 and standard deviation value of .81298. Concisely, the study results revealed that employees are empowered to make decisions pertaining the organizations success as indicated by a mean value of 4.4510 and standard deviation value of .73965.

The findings compare with those by Mello (2007) who found that compensation was mainly an aspect of get committed through specific traits and capabilities to be responsible and progressively making decisions that are coherent to organizational goals and objectives. According to Ozsahin, et al. (2011), an employee who understands their roles and performing his or her duties appropriately needs to be compensated accordingly to improve the

organizational performance by passing skills and competencies to the entire team thus translating to increased productivity and performance.

4.1 Effect of Job security on organizational performance of the Judiciary in Nairobi.
The study also sought to determine the effect of job security on organizational performance of the Judiciary in Nairobi. The respondents were presented with Likert-type statements aimed at meeting this objective. The findings obtained are presented in Table 4.2.

Table 4.2: Effect of Job security on the Organizational Performance

Statement	Mean	Std. Deviation
I have an up to date contract of employment.	4.5784	.72353
The Judiciary has favorable terms of employment stipulated in the contract.	3.7843	1.13126
All employees undergo a rigorous probation period	4.2549	.90855
Employees undergo a fair performance evaluation.	3.0294	1.22236

From the results of the study majority of the respondents agreed strongly that they have an up to date contract of employment as indicated by mean value of 4.5784 and standard deviation value of .72353. The respondents also agreed that the Judiciary has favorable terms of employment stipulated in the contract as shown by a mean value of 3.7843 and standard deviation of 1.13126. The results showed that majority of the respondents strongly agreed that all employees undergo a rigorous probation period as shown by a mean value of 4.2549 and standard deviation value of .90855. Concisely, majority of the respondents agreed that employees undergo a fair performance evaluation as shown by a mean of 3.0294 and standard deviation of 1.22236.

These results collaborate previous findings by (Saleem, 2014) who conclude that employee job security helps in enhancing employees' workplace confidence and relaxed mind set.The findings are also in agreement with (Fan, 2012; Haslam et al., 2010; Julizaerma and Sori, 2012) whom confirm there is an existing literature indicates that there is a significant relationship between employee performance and the job security in the organization.

4.3 Effect of Employee training and development on organizational performance of the Judiciary in Nairobi.
The study sought to evaluate the effect of employee training and development on the organizational performance of the judiciary in Nairobi. To this various Likert-type statements were presented to the respondents. The responses obtained were presented in Table 4.3.

Table 4.3: Effect of Employee training and development on the Organizational Performance

Statement	Mean	Std. Deviation
Employees are familiar with the work systems	4.5980	.70724
Judiciary has reliable work systems	3.9412	.86544
Employees undergo proper orientation.	4.4020	.70724
Every employee has an equal chance to undergo training	4.3137	.77050

Research results indicates that majority of the respondents strongly agreed that employees are familiar with the work systemsas shown by a mean of 4.5980 and standard deviation of .70724. The respondents also agreed that Judiciary has reliable work systems as shown by a mean value of 3.9412 and standard deviation of .86544. the respondents also agreed that employees undergo proper orientation as shown by a mean of 4.4020 and standard deviation of .70724. In addition, the study results found that majority of the respondents agreed that every employee has an equal chance to undergo training as shown by mean of 4.3137 and standard deviation value of .77050. The study findings are in

tandem to that of Peterson, Smith, & Martorana (2003) who found that there is a positive relationship between employee training and development and performance of an organization. (Barney, 2014) also concludes that indicators of employee training and development such as reliable system, employee orientations and frequent team building, and seminars are key determinants of employee productivity.

4.4 Effect of Employee motivation on organizational performance of Judiciary in Nairobi.

The study sought to examine the effect of employee motivation on the Organizational performance of the Judiciary in Nairobi. To this various Likert-type statements were presented to the respondents. The responses obtained were presented in Table 4.4.

Table 4.4: Effect of Employee Motivation on the Organizational Performance

Statement	**Mean**	**Std. Deviation**
I am satisfied with how am assigned duties	4.4118	.82478
I am accountable for my works	3.4216	1.03824
I am rewarded for my hard work through incentives	4.0588	.93238
Whenever we implemented a project, we normally use the least possible input	3.7941	1.02614

From the study, majority of the respondents strongly agreed that they were satisfied with how they were assigned duties as shown by a mean value of 4.4118 and standard deviation of .82478. The respondents neither agreed nor disagreed that they were accountable for their works as shown by a mean value of 3.4216 and standard deviation of 1.03824. The study findings also revealed that the majority of the respondents agreed that they were rewarded for their hard work through incentives as shown by mean value of 4.0588 and standard deviation value of .93238. In conclusion, the respondents agreed that whenever they implemented a project, they usually used the least possible input as indicated by a mean of 3.7941 and standard deviation of 1.02614. The findings agreed with (Nyamari,2017) as the results showed that motivational values indicators such as attractive non-monetary rewards, adequate reward schemes and job security, as independent variables had a significant relationship with the operational performance of the organization.

4.5 Organizational Performance of the Judiciary in Nairobi

The study sought to determine the Organizational performance of the Judiciary in Nairobi. To this various Likert-type statements were presented to the respondents to establish their opinion on the study subject. The responses obtained were presented in Table 4.5

Table 4.5: Organizational Performance

Statements	**Mean**	**Std. Dev.**
Delivery of organizational mandates is always delivered.	4.2647	.97419
Delivery of work is a responsibility of each employee.	3.9902	.76424
Delivery of service by the organization incurs least costs.	4.6863	.61307
Delivery of project implementation by the Judiciary is done through the least possible input.	2.6613	1.9925
Delivery of performance by the Judiciary is done though offering improvement programs for its employees.	4.6765	.69170

The study sought to find out the respondent'sagreement level with the statements on a measure of organizational performance. The findings as shown in Table 4.7 indicated that on the first statement that delivery of organizational mandates was always delivered, majority of the respondents agreed with the statement as shown by a mean of 4.2647 and a standard deviation of .97419. The second statement was that delivery of work was a responsibility of each

employee and the majority agreed as shown by a mean of 3.9902 and a standard deviation of .76424. The other statement was that delivery of service by the organization incurred least costs. Majority of the respondents agreed with the statement as shown by a mean of 4.6863 and standard deviation of .61307 while on the Fourth statement that delivery of project implementation by the Judiciary was done through the least possible input. Majority of the respondents disagreed as shown by a mean of 2.6613 and a standard deviation of 1.9925. In the last statement, majority of the respondents agreed that delivery of performance by the Judiciary was done though offering improvement programs for its employees. Thomas (2010) stated that a well performing organization was more likely to embrace effective and high level of employee retention strategies unlike a poorly performing organization that may not uphold employee retention strategies.

4.6 Diagnostic Tests

A regression model was adopted in the study to establish the statistical relationship between the independent and the dependent variables. The model however, has several assumptions such that if they are not met, the results may be biased. These assumptions include the assumption that the data is normally distributed (normality), the assumption that the data is not auto-correlated, no multicollinearity and that there is no heteroscedasticity in the sample data. This study therefore carried out the diagnostic tests to ensure that the assumptions of regression model are met.

4.7 Regression Analysis

The purpose of the study was to determine the effect of employee retention strategies on organizational performance of the Judiciary in Nairobi. In this regard, multiple regression analysis was carried to further test the relationship between the variables. The findings obtained are presented in Tables 4.6 to 4.8.

Table 4.6: Model Summary

Model Summary				
Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	.919[a]	.844	.838	.52097
a. Predictors: (Constant), Employee compensation, employee job security, employee training and development and employee motivation.				

The regression model adopted by this study can explain 84.4% of the variability in the data. This is indicated by the R Square value of 0.844 which shows that the data closely lies around the fitted regression line. The Adjusted R Squared Value of 0.838, which is less than the R-Squared Value, shows how well the model generalizes the relationship between the variables. In this study it can be deduced that only 83.8% of *variation in the data is explained by the independent variables that actually affect the dependent variable.*

Table 4.7: Analysis of Variance

ANOVA[b]						
Model		Sum of Squares	Df	Mean Square	F	Sig.
1	Regression	165.670	4	41.417	136.419	.000[a]
	Residual	30.669	242	.303		
a. Predictors: (Constant), Employee compensation, employee job security, employee training and development and employee motivation						
b. Dependent Variable: Organizational Performance						

As shown in Table 4.7 on Analysis of Variance (ANOVA), an F-test Value of 136.419, P<0.05 was obtained. The P value of less than 0.05, shows that there was overall significant relationship between all the independent variables and the dependent variable of the study.

Table 4.8: Regression Coefficients

Coefficients[a]						
Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.
		B	Std. Error	Beta		
1	(Constant)	1.787	.845		2.116	.037
	Employee compensation	1.418	.062	1.036	22.803	.000
	Employee Job security	1.041	.448	.261	2.325	.022
	Employee training and development	.197	.481	.046	.409	.027
	Employee motivation	.098	.440	.027	.224	.002
a. Dependent Variable: Organizational Performance						

Based on the study findings, the hypothesis equation model becomes:
Organizational Performance= $1.787 + 1.418\ X_1 + 1.041\ X_2 + 0.197\ X_3 + 0.098\ X_4$
From the findings in Table 4.8, the study found that holding Employee compensation, employee job security, employee training and development and employee motivation, at zero organizational performance was 1.787. It was established that a unit increase in employee compensation, while holding other factors (employee Job security, employee training and development, employee motivation) constant, will lead to an increase in organizational performance by 1.418 ($p = 0.000$). Further, a unit increase in employee job security, while holding other factors (employee training and development, employee motivation, employee compensation) constant, will lead to an increase in organizational performanceby 1.041 ($p = 0.022$). A unit increase in employee training and development, while holding other factors (employee motivation, employee compensation, job security) constant, will lead to an increase in organizational performance by 0.197($p = 0.027$). Moreover, a unit increase in employee motivation, while holding other factors (employee Job security, employee training and development, employee compensation) constant, will lead to an increase in organizational performance by 0.098 ($p = 0.002$). This infers that employee retention strategies contribute most to organizational performance. At 5% level of significance and 95% level of confidence, employee compensation, employee job security, employee training and development and employee motivation significant in organizational performance.

The regression coefficients obtained show significant t-test values ($P<0.05$) for each of the independent variables (employee compensation $t=22.803$, $P<0.05$ thus this being the most significant variable ($t=22.803$); Employee Job security $t=2.325$, $P<0.05$; Employee training and development, $t=0.409$, $P<0.05$ and; Employee motivation, $t=0.224$, $P<0.05$). This shows that all the variables have significantly relationship with the dependent variable (Organizational Performance).

The significant positive relation between employee retention strategies and Organizational Performancerefute Schmidt's (2010) whose meta-analysis conducted on 88 individual studies representing a sample size of 32,472 observations done between 1956 and 2003 showed the relationship between employee retention techniques and organizational performance as dubious if not non-existence and does not have a positive effect on performance of the organization.

5.0 Employee Compensation and Organizational Performance

The first objective of the study was to establish the effect of employee compensation on organizational performance. The study established that qualified applicants were offered equal chances of being employed at the Judiciary of Kenya. The findings further revealed that there was clear communication of duties and responsibilities to recruited employees of the Judiciary. The findings portrayed that the employees were empowered to make decisions pertaining to the organizations success. The inferential analysis of the study model revealed that indeed employee compensation had a positive and significant influence on the performance of Judiciary in Nairobi.

5.1 Employee Job Security and Organizational Performance

The second objective of the study was to establish the effect of employee job security on organizational performance. The study found that the Judiciary has favorable terms of employment stipulated in the contract. The respondents

indicated that all employees undergo a rigorous probation period. The study further established that employees undergo a fair performance evaluation. The results of the model also revealed that employee job security positively and significantly influenced the performance of Judiciary in Nairobi.

5.2. Employee Training and Development and Organizational Performance

The third objective of the study was to assess the effect of employee training and development on organizational performance. The study established that employees were familiar with the work systems. The findings further portrayed that Judiciary has reliable work systems. The study also established that every employee had an equal chance to undergo training. The study further established that employees undergo proper orientation. The model output revealed that employee training and development positively and significantly influences the performance of Judiciary in Nairobi.

5.3 Employee Motivation and Organizational performance

The fourth objective of the study was to establish effect of employee motivation on organizational performance. The study established that the employees were satisfied with how they were assigned duties. The findings further revealed that majority of the respondents disagreed that whenever we implemented a project; they normally use the least possible input. Moreover, the study established that the employees were rewarded for the hard work through incentives. The results on both the univariate and overall model revealed that employee motivation had a positive and significant influence on performance of Judiciary in Nairobi.

6.0 Discussion, Conclusion and Recommendations

The study concluded that employee retention strategies were a critical driver to organizational performance in the Judiciary in Kenya. The findings outlined the prospects of employee retention strategies such as compensation, job security, training and development and motivation. The study concluded that the Judiciary in Nairobi had put in place effective employee retention strategies. This came after the realization that an organization needs to invest in employee retention strategies in order to be successful. This has been achieved through a good compensation package which involved, offering an attractive, competitive; benefits package with components such as life insurance, disability insurance and flexible hours motivates employees to commit themselves to an organization.It was concluded that employee retention strategies had a positive and significant effect on organization performance.

Based on the findings of the study, the following recommendations are herein drawn; That the Judiciary through the management should ensure effective employee retention strategies through example setting and involving employees in decision making and other organizational matters so as to put them on board towards enhancing firm performance The management of Judiciary should ensure effective rewarding and promotion of employees as a way of making them comfortable and economically empowered so as to perform better. Employees should be steered towards aligning their goals to those of the organization to not only contribute to firm growth but also to their personal growth and development.

Organizational management should embrace a supportive training and development to the employs and provide them with skills and expertise of performing duties in effective and efficient manner. Employees should be allowed to air their views and be involved in decision making and allowed to join any trade union that they find addressing their issues. This way, they were motivated to contribute more to firm performance.

The study focused on the employee retention strategies and organizational performance. There should be a study to establish other prospects of influencing performance of Judiciary which were exceedingly facing performance challenges. The study focused on Judiciary in Nairobi while there were other industries and organizations even in the private sector facing the same problems as far as employee retention strategies and performance was concerned. There should be a study to therefore unveil influence of these prospects while focusing on other sectors.

Abstract
The study sought to determine the effect of international crude oil prices and the US dollar-Kenya shilling exchange rate on the average monthly retail prices of four oil products (Super, Diesel, Kerosene and Regular) in Kenya from year 2009 to 2012; the relationship between average monthly oil retail prices for the four products in the period before (2009-2010) and the period after introduction of price controls (year 2011-2012). Using multiple regression analysis and Pearson's correlation analysis, the study found that monthly international crude oil prices and monthly exchange rates had a significant effect on average monthly retail prices for all the four products. The two predictor variables had a lesser explanatory power on average monthly oil retail prices in the period after introduction of price controls compared to the period before such controls suggesting that price controls had caused some effect on average monthly retail oil prices of all the four oil products. In the period before introduction of price controls, monthly international crude oil prices and exchange rates explained much of Super prices and very little of Kerosene prices whereas after the introduction of price controls, the two predictor variables explained more of Diesel prices but very little of Regular prices. A positive correlation between average monthly retail prices of Super and Diesel products in the period before and after introduction of the controls was documented unlike Kerosene and Regular average monthly retail prices which exhibited a negative correlation. The study recommends the need for ERC to closely monitor international crude oil prices and the manage dynamics of the US dollar-Kenya shilling exchange rate with a view of stabilizing the latter. **Keywords:** price controls, price ceiling, price floor and price asymmetry.

JEL Classification: E640 (Pricing Policy), H42 (Publicly provide private goods), E3 (prices, business fluctuations and cycles), F31 (Foreign Exchange), L1 (Market Structure, firm strategy and market performance).

Background

The oil marketing sector plays a significant role in the economic growth of Kenya considering that oil is an essential commodity in industrial production, transportation and generation of water, electricity amongst other products. Hardwick, Langmead and Khan (1999) indicate that oil marketing is characterized by oligopoly with only a few firms controlling the market, besides the sector being associated with barriers to entry and exit and the high volume of threshold that the firms are required to maintain. The oil marketing sector received increased attention in Kenya following the rise of international crude oil prices in the period 2007-2008 which prompted the oil marketing firms to pass on the cost to consumers. When the oil retail prices declined towards the end of year 2008, the firms did not reciprocate to reduce the retail prices for their oil products. This prompted the Kenyan government (through the Energy Regulatory Commission) to introduce price controls to regulate retail prices of selected oil products. Kilian (2009) attributes the sharp price increase in 2007–2008 to the combination of increased demand and stagnant supply, linking the increase in oil demand to the fast growth of emerging economies such as China and India.

The pricing of oil products is often a complex process which is controlled by the relevant government department. When the price controls were introduced in Kenya, kerosene became expensive and the government had to reduce taxes on kerosene. According to Petroleum Insight (2012), in year 2011, sales for diesel were 1,769,029m^3, petrol 781,032m^3 and sales for kerosene were 340,603m^3. Grant, Ownby, and Peterson (2006) indicate that the price of crude oil is the most significant factor in determining retail prices for petroleum products besides the interaction of forces of demand and supply. Despite the ERC setting the maximum pump prices for selected products, the retailing firms have a leeway in determining the actual oil retail prices bearing in mind their unique conditions, international crude oil prices, exchange rate changes among other factors. This has often led to a fluctuation in average monthly retail prices for several oil products.

Governments often introduce price controls to protect the general public against exorbitant prices by retailers and other oil marketers. Taylor and Weerapana (2011) define price controls as a government regulation that sets or limits the price to be charged for a particular good which can either be a price ceiling, price floor, or a minimum price at which a good can be bought or sold. Price ceiling controls set a maximum price that may be charged but do not prevent goods to be sold at lower prices below the ceiling price (Tucker, 2010). Price floor is defined as a government price control that sets the minimum allowable price for a good according to Taylor and Weerapana (2011). Taylor (2006) contends that price controls are only effective for a short term basis and when they take place over a long term, they can lead to shortages, rationing, quality deterioration, long queues and black markets. Such controls are instituted by governments to protect consumers against oligopolistic price practices (Mostert & Mathews, 2000). In most jurisdictions, price controls include: setting price ceilings/caps and floors, setting a pricing formulae, creating a price stabilization fund, government interventions in the form of calculating and publishing new prices to protect consumers against exploitation, extending subsidies and favourable tax treatment to oil marketing firms among others (Kojima et al., 2010; Taylor et al., 2011; Mankiw, 2008; www.erc.go.ke).

In Kenya, petroleum retail prices are controlled through price capping by ERC which is reviewed monthly. The ERC sets maximum retail pump prices for selected products on a monthly basis and become effective and remain in force from the 15th of the calendar month until the 14th of the following calendar month (www.erc.go.ke). The situation may vary across different jurisdiction. Kojima et al. (2010) found that Malawi's system of price controls was some price stabilization fund while in Botswana, Senegal and South Africa, oil prices were controlled in such a way that the price adjustment was automatic based on some pre-established administrative procedures. Johnson and Johnson (2006) indicate that the oil industry is characterized by unstable prices hence the need for price controls.

Literature has attempted to document the effect of changes in crude oil prices and exchange rates on oil retail prices (Manning, 1991; Really et al., 1998). A rise in crude oil prices to a high of US $ 147 per barrel (in the second half of year 2008) led to a sharp rise in the retail price of premium petrol in Kenya to over Ksh. 100 per litre (Petroleum Insight, 2009). Kilian (2008) contends that most economies in the world are largely affected by global increase in petroleum product prices which influence retail prices. International crude oil prices rose sharply in the second half of year 2008 to a high of US $ 147 per barrel causing a sharp rise of oil products in Kenya; in the last quarter of year 2008, crude oil prices plummeted a great deal to an average of about US $45 per barrel (Petroleum Insight, 2009). The volatility of the Kenyan shilling further complicates the situation for the oil marketing firms who have to do their settlement in foreign currency. The Borenstein, Cameroon and Gilbert (1997) study found some evidence of price asymmetry between gasoline prices and changes in crude oil prices. The US dollar- Kenya shilling exchange rate is similarly key in explaining retail pricing of petroleum products in Kenya since imported petroleum products

are settled in US dollars and the same appreciated over the Kenya shilling in the better part of year 2008 and 2011 (National Energy Policy, 2012).

Most of the East African countries depend on imported crude oil and refined petroleum products from the Middle East region (Knight, 2003) with Kenya being no exception. In Kenya, the ERC instituted a pricing formula to be used by oil marketing firms and the same was published in the Kenya Gazette Legal Notice 196 in year 2010. In determining the maximum retail pump prices for super petrol, regular petrol, kerosene and diesel products, the formula takes into account transportation cost from Mombasa to the nearest wholesale depot, allowed loses in the pipeline and in the depot, allowed gross wholesale and retail margins among other considerations. In view of the formulae, actual oil retail prices for various oil products will vary from one oil marketing firm to the other bearing in mind the unique aspects of each of the firms. The 1974 oil crisis in Kenya prompted the government to undertake some structural adjustment programmes in the late 1980s (KIPPRA, 2010) which saw the introduction of some price controls but the same was to be abandoned shortly thereafter after the 1989 Restrictive Trade Practices, Monopolies and Price Control Act was introduced. The ERC was to be established as an energy sector regulator in Kenya through the Energy Act of 2006 which came into effect in July 2007 (ERC, 2008). The regulator sets retail prices for oil products using a pricing formula and corrects price irregularities as stipulated in the Energy Act of 2006.

Kenol-Kobil and Total Kenya are among the major oil firms in the country which consistently performed better in the period before and after the implementation of price controls. The two are the only listed oil marketing firms at the Nairobi Securities Exchange. Total Kenya is one of the major oil marketing companies in Kenya with over one hundred and seventy service stations country wide and a large market share. The company has often experienced an increase in net turnover by up to 10% despite the rise in international oil prices and the impact of the depreciating Kenya shilling against the US dollar (www.total.co.ke). The key players in the Kenyan oil industry include: Kenol-Kobil, Total Kenya, Shell, Oil Libya, National Oil and GAPCO (Petroleum Insight, 2011). Three major oil marketing firms (KenolKobil, Total and Shell) have large market share of over 50% of the market share in the oil industry in Kenya; by September 2012, the multinational oil marketers were controlling 51.4% of the market share that is Kenolkobil 19.4%, Total 17.9% and Shell 14.1% (Petroleum Insight, 2012).

For purposes of this study, the predictor variables were the monthly international crude oil prices and the monthly US dollar-Kenya shilling exchange rate over the period 2009-2012. The average monthly pump prices for Super, Diesel, Kerosene and Regular oil products were the dependent variable of the study. The predictor effects and relationship between the predictors and the dependent variables were evaluated using multiple regression analysis and simple correlation analysis respectively.

Objectives of the Study

The study sought to achieve two objectives:

i. To determine the effect of international crude oil prices and US Dollar-Kenya shilling exchange rate on average monthly oil retail prices in the period before and after introduction of price controls in the oil marketing sector in Kenya. ii. To determine the relationship between average monthly oil retail prices in the period before and the period after the introduction of price controls in the oil marketing sector in Kenya.

Methodology

Average actual monthly retail oil prices (for Super, Diesel, Kerosene and Regular products), average monthly international crude oil prices and the US dollar-Kenya Shilling monthly average exchange rates (all for the period 2009-2012) were obtained from the Petroleum Institute of East Africa, Ministry of Energy and the Kenya National Bureau of Statistics. Monthly data was considered appropriate considering the erratic nature of fuel prices and fluctuations in international crude oil prices and exchange rates.

Data analysis methods were Multiple Regression Analysis (standard) and Simple Correlation analyses which were aided by Statistical Package for Social Sciences (SPSS) version 21. R square and p-values were used to determine the effect of the predictors on the outcome variable at a significance level of 0.05. Pearson's Simple Correlation was used to determine the nature and strength of relationship between maximum oil retail prices for the four products in the period before and after the introduction of price controls in the Kenyan oil marketing sector. Preceding the

regression analysis were preliminary diagnostic tests of: normality, multicollinearity and homoscedasticity which were all within acceptable thresholds. The regression model is captured hereunder.

$Y_i = \beta_0 + \beta_1 X_1 + \beta_2 X_2 + \varepsilon$

Where: Y = average monthly retail price for the i^{th} product (Super, Diesel, Kerosene and Regular); X_1 = average monthly international crude oil prices; X_2 = average monthly US dollar- Kenya Shilling exchange rate; β_0 = constant; ε = error term

Results and Discussion

To establish the effect of international oil prices and the exchange rate (US dollar-Kenya shilling) on maximum retail oil prices 4 oil products, a standard multiple regression analysis was adopted. Average monthly International oil prices and the US dollar- Kenya Shilling exchange rates were taken to be the independent variables whereas average maximum monthly retail prices for Super, Diesel, Kerosene and Regular products were the dependent variable of the study.

Table 1: Regression results for period before price controls (2009-2010)

Retail price (Y)	Constant(β_0)	International oil price	Exchange Rate	R^2	F-statistic	P-value
Super	-92.93146	0.6315395	1.730869	0.9116	103.125	0.0000
Diesel	-84.93465	0.5648996	1.581599	0.8972	87.28925	0.0000
Kerosene	-26.06242	0.02588	1.108873	0.5380	11.64574	0.0004
Regular	-128.0425	0.4213999	2.344514	0.8471	55.40708	0.0000

Significance level = 0.05

From the output in Table 1 above, regression functions are extracted as follows:

Super - $Y_s = -92.93 + 0.63X_1 + 1.73X_2$; Diesel- $Y_d = -84.93 + 0.56X_1 + 1.58X_2$

Kerosene $Y_k = -26.06 + 0.03X_1 + 1.11X_2$ Regular $Y_r = -128.04 + 0.42X_1 + 2.34X_2$

In view of the results in Table 1 above for the period before introduction of price controls in Kenya, international crude oil prices and average exchange rates explained much of retail prices of *Super petrol* than any other petroleum product (91.16%) whereas the two variables had the least contribution in explaining retail prices for *kerosene* (53.8%). Katisya (2010) indicates that depending on the product mix, oil marketing companies would subsidize some products like kerosene and subsequently maximize their margins on their products. International crude oil prices and exchange rates explain much of retail price changes for *Diesel and Regular products*. In general, international crude oil prices and exchange rate changes have a significant effect on retail prices for all the four oil products (Super, Diesel, Kerosene and Regular) at a significance level of 0.05. The Asplund et al. (2000) study in the Swedish gasoline market found that gasoline prices responded more rapidly to exchange rate movements than to spot market prices.

However, evidence from other markets shows that there are other factors and different forms of price controls which affect pricing of oil products: Bacon (2009) found that taxation was a key factor in explaining retail fuel prices in Cambodia. Bloomberg and Harris (1995) attribute changes in retail prices to exchange rate movements based on the law of one price. Drollas (2012) indicates that sort term prices of oil are mainly explained by stock disequilibrium that is the difference between stocks that the companies want to hold and the stock they are actually holding. Hence, the retail prices in the current study could similarly be explained by these factors over and above international crude oil prices and exchange rate changes.

Table 2: Regression analysis of period after introduction of price controls (2011-2012)

Retail price (Y)	Constant(β_0)	International oil price	Exchange Rate	R^2	F-statistic	P-value
Super	12.44403	0.2680342	0.808742	0.3733	6.551178	0.0059
Diesel	3.842277	0.3875789	0.6602314	0.4536	9.131447	0.0013
Kerosene	16.68555	0.2224884	0.5032951	0.3181	5.13057	0.0148
Regular	21.48292	0.2983062	0.6539614	0.2674	4.015519	0.0326

Significance Level= 0.05
The output in Table 2 is summarized into the following regression functions:

Super : $Y_s = 12.44 + 0.27X_1 + 0.81X_2$; Diesel : $Y_d = 3.84 + 0.39X_1 + 0.66X_2$

Kerosene $Y_k = 16.69 + 0.22X_1 + 0.5X_2$; Regular $Y_r = 21.48 + 0.3X_1 + 0.65X_2$

Results in Table 2 above are in view of the period after introduction of price controls (years 2011-2012). In comparison to the period before the introduction of price controls (see Table 1), international crude oil prices and exchange rates explained much less of monthly retail prices for each of the four petroleum products (Super, Diesel, Kerosene and Regular). In particular, the two predictor variables explained much of the changes in retail prices for Diesel compared to the to the other three petroleum products. Considering that Diesel is highly consumed worldwide especially in the manufacturing sector (and Kenya is no exception), the forces of demand and supply in the global market could be an explanation for Diesel prices being more sensitive to changes in international crude oil prices and exchange rates in comparison to the other three products. Similarly, Bashmakov (2003) and Cropper (2004) suggest a higher price ceiling for Diesel.

Results further indicate that the two predictor variables had the least effect in explaining monthly retail prices for Regular. However, international crude oil prices and exchange rates had a joint significant effect on retail prices for all the four products (in the period 2011-2012) similar to the period before introduction of oil price controls in Kenya (2009-2010).

In view of the regression coefficients of international crude oil prices and exchange rates over the period before and after introduction of price controls, a unit change in the two predictor variables caused *a smaller change* in monthly retail prices for each of the four products in the period after introduction of controls compared to the period before introduction of price controls (see Table 3 below).

Table 3: Summary of regression coefficients before and after price controls

Product	Regression coefficient of International price (before price control)	Regression coefficient of International price (After price control)	Regression coefficient of Exchange (before price control)	Regression coefficient of Exchange (After price control)
Super	0.6315395	0.2680342	1.730869	0.808742
Diesel	0.5648996	0.3875789	1.581599	0.6602314
Kerosene	0.02588	0.2224884	1.108873	0.5032951
Regular	0.4213999	0.2983062	2.344514	0.6539614

Source: research data, 2015 Correlation of maximum retail oil prices in the period before and after price controls
The essence of the correlation analysis of maximum retail prices for the four products over the 2 periods was to determine the consistency in price changes. In view of the results in Table 4 below, Super1, diesel1, kerosene1 and

regular1 *represents retail prices* in the period *before introduction of price controls* whereas super2, diesel2, kerosene2 and regular2 *represents retail prices* in the period *after introduction of price controls.*

Table 4: Correlation of maximum oil retail prices for periods before and after price control

Product	Super1	Super2	Diesel1	Diesel2	kerosene 1	kerosene 2	Regular 1	regular 2
Super1	1.0000							
Super2	**0.3665**	1.0000						
Diesel1	0.9780	0.3399	1.0000					
Diesel2	0.2337	0.9493	**0.2232**	1.0000				
Kerosene 1	0.4186	-0.5231	0.4339	-0.6366	1.0000			
Kerosene 2	-0.2827	0.7041	-0.2642	0.8235	**-0.7254**	1.0000		
Regular1	0.8988	0.0178	0.8910	-0.1247	0.7365	-0.5217	1.0000	
Regular2	0.3231	0.9108	0.2785	0.8843	-0.5173	0.6272	**-0.0306**	1.0000

Correlation results in Table 4 above indicate the nature and strength of relationship between the maximum retail oil prices for the four products in the period before and period after introduction of oil price controls in Kenya. The results indicate that Super and Diesel products had a *positive relationship* that is the retail prices moved in the same direction over the two periods indicating some consistency over the two periods. In addition, Super retail prices exhibited a *moderately positive correlation* (0.3665) in the period before and period after introduction of price controls whereas Diesel exhibited a *fairly weak positive correlation* over the two periods (0.2232). The retail prices for Kerosene and Regular exhibited a negative correlation over the two periods showing some inconsistency. In particular, Kerosene exhibited a *fairly strong negative correlation* (0.7254) unlike Regular whose correlation of prices over the two periods was *fairly weak* (-0.0306). These results are similar to Borenstein et al. (1997) who found price asymmetries in retail prices and changes in crude oil prices in the US gasoline market. Similarly, Contin (2000) found inconsistencies between gasoline prices and changes in crude oil prices in the Spanish gasoline market. Manning (1991) indicates that such inconsistencies in petrol prices are an indication of market imperfections.

Findings

The study documents several findings in view of the results. Firstly, international crude oil prices and exchange rates explain much of Super retail prices and very little of Kerosene prices in the period before introduction of price controls; secondly, international crude oil prices and exchange rates had a significant effect on monthly retail prices in both periods (before and after introduction of price controls); thirdly, upon introduction of price controls, international crude oil prices and exchange rates had a lesser joint explanatory power on monthly retail prices for all the four products compared with the period before introduction of the price controls; fourthly, after introduction of price controls, international crude oil prices and exchange rates explained more of Diesel retail prices than any other product but the two predictors explained less of Regular retail prices; fifthly, a unit change in international crude oil prices and exchange rates brought about a smaller change in all the four retail prices after the introduction of price controls compared to the period before introduction of price controls; Lastly, when comparing the correlation between retail prices for the four products before and after introduction of price controls, the study found a positive correlation for retail prices for Super and Diesel unlike Kerosene and Regular whose correlated prices were negative over the two periods respectively with the former uncharacteristically exhibiting a strong negative correlation.

Conclusions

In view of the documented findings, the study makes several conclusions. Firstly, international crude oil prices and the US dollar-Kenya shilling exchange rates have a significant effect on monthly retail prices for Super, Diesel, Kerosene and Regular products in Kenya; secondly, the introduction of oil price controls in Kenya in the latter part of year 2010 brought about some effects on retail pricing of the four products considering the reduced predictive power of international crude oil prices and exchange rates in the period after introduction of the controls; international crude oil prices and exchange rates have an individual and joint effect on the retail pricing of the four oil products; lastly, there is some consistency (for Super and Diesel) as well as inconsistency (for Kerosene and

Regular) in oil retail prices in Kenya considering the positive and negative correlations of the individual product prices over the period before and after introduction of price controls in Kenya.

Recommendations

The study makes the following recommendations from the findings and conclusions. Firstly, the ERC should still consider changes in international crude oil prices and the changes in the US dollar-Kenya shilling exchange rate in setting maximum oil retail prices for the four products; secondly, ERC should similarly consider the effect of other factors on oil retail prices considering the low coefficient of determination (R square) after the introduction of oil price controls; thirdly, the Government of Kenya ,through the central bank, should regularly manage the US dollar-Kenya shilling exchange rate to avoid an adverse effect of the same on oil retail prices considering the strategic nature of the oil sector in industrial production and transportation; lastly, ERC should consider introducing more price controls in the pricing of oil products since the controls currently in place leave much of the oil retail prices unexplained.

Limitations and Areas for further Study

The study encountered several limitations which are noteworthy. Firstly, though international crude oil prices and exchange rates are widely documented as the key determinants of oil retail prices, other factors such as competition, government policy and transportation cost do have an effect on retail pricing but the same were outside the scope of the study- and this could be an area for further study; secondly, discussions of findings were limited to the extent of lack of adequate empirical literature from the Kenyan oil market; thirdly, the use of secondary data is often associated with undetected errors which could have been in the data and the same could affect the final outcome of the study; fourthly, the study was carried out over a four year period- a longer period could have provided more explanatory power but the same could not be adopted since price controls were introduced in Kenya towards the end of year 2010- in future, similar studies covering at least 6 years could be carried out.

Abstract
The paper reviews literature on securitization process in real estate markets and an analysis of the subprime mortgage market crisis of 2007-2008. In particular, it presents a highlight of the various market participants in the securitization process and an overview of securitized transactions in the US secondary mortgage market. The paper further presents a highlight of financial malpractices precipitating the subprime mortgage crisis and the associated financial implications of the same. In addition, the paper identifies the institutions and participants in the subprime mortgage crisis securitized transactions leading to the housing market debacle. The paper further explores the creation of ABS and CDOs as an outcome of securitization and a review of empirical literature on financial implications associated with the abuse of securitized transactions in the US mortgage market.

Key Words: ***Securitization, Asset-Backed Securities, Special-Purpose Vehicles/Entities, Credit enhancement and Conduit Lending.***

1. Introduction

The paper presents a review of general, theoretical and empirical literature on the securitization process in the real estate market, a financial analysis of securitization process and an overview of the institutions that participate in the process. In particular, the paper reviews both general and empirical literature on securitized transactions in the events leading to the subprime mortgage market crisis of 2007-2008. First, the paper documents the securitization process in terms of the key participants/institutions involved in the process and their role. In addition, it reviews literature on ABS and CDOs as the main forms of securitization in real estate markets.

2. Operational definition of terms

Securitization- this is a process (in structured finance) that creates complex debt instruments by pooling assets (especially receivables) into low risk entities in order to limit risk exposure.

Subprime Mortgage- these are low quality loans that were sold by loan originators during the period preceding the mortgage market fiasco of 2007-2008. Such loans were issued to home buyers who did not have the repayment ability with most of them subsequently defaulting soon after.

Credit Rating Agencies- these are firms that give an outside perspective or unconditional view of the risk exposure and rating of securities that investors are about to invest.

Conduit Lending- the loan originators generated poor quality loans from high credit risk mortgage borrowers without property 'screening' them since the originators knew that they would quickly sell off such loans in the secondary mortgage markets to unsuspecting secondary mortgage market investors.

2. Review of Literature

2.1 Securitized Transactions and Institutions involved in Securitization

Securitization is the selling of debt instruments backed by a pool of mortgages; the process is associated with several frictions which involve moral hazards, adverse selection and principal-agent problems (Ashcraft & Schuermann, 2008). Securitization is a financial transaction (under structured finance) in which a corporate entity moves assets/ pools assets or loans to an ostensibly bankruptcy–remote/ low risk vehicle to obtain lower interest rates from potential lenders since the standardized securities are collateralized/secured. The process involves packaging of designated pools of loans or receivables with an appropriate credit enhancement and redistribution of these packages to investors. Transformation of these pools into standardized securities enables issuers to deal in a volume large enough that they can bypass intermediaries (Giddy, 2004; Bodie *et al.*, 1992). Structured finance is a financing technique tailored to special needs or constraints of issuers or investors (Giddy, 2008).

The issues created out of securitization are low risk ventures since the asset cannot be seized in a bankruptcy proceeding courtesy of SPVs. An SPV is a legal entity created by a sponsor or originator to carry out some specific purpose or a series of transactions (Gorton & Soules, 2005). The SPVs exist essentially to reduce bankruptcy costs since they cannot in practice go bankrupt. The risk is therefore low for lenders and they are willing to ask for a lower interest rate. This financial process (securitization) leads to an emission of ABS and CDOs. *Structured finance* is a process that involves the creation of complex debt instruments by securitization or the addition of derivatives to existing instruments by pooling assets, tranching of liabilities and creation of special purpose vehicles to limit risk. Structured finance involves pooling of economic assets and subsequent issue of prioritized capital structure claims against these collateral pools (Coval et al, 2008). The securitization process involves packaging of designated pools of loans or receivables with an appropriate *credit enhancement* and redistribution of these packages to investors. Transformation of these pools into standardized securities enables issuers to deal in a volume large enough that they can bypass intermediaries (Giddy, 2004). Credit enhancement is meant to reduce the risk to the investors and subsequently increasing the rating of the securities. The process of securitization is *complex* and *involves several parties*. Assets (like Mortgage receivables, student loans and car loan receivables) are pooled together and shares (backed by these pools of assets) are sold. In this process, a suitably large portfolio of assets is 'pooled' and sold to an SPV; there is normally no recourse to the originator. The issuer (SPV) is bankruptcy remote since the likelihood of default is minimal; their activities are restricted to issuance of securities. A servicer collects payments and monitors the assets; the servicer can often be the originator. They ensure that the loan repayments are paid to the SPV. The investor benefits by investing in a specific pool of high quality credit-enhanced assets; all investors receive a pro rata interest in the incoming revenues from the asset pool (Lumpkin, 2002). Securitization deals may at times be faced with foreclosure. This is the legal right of a lender of money if the borrower fails to repay the money or part of it on the due date. The lender would apply to the court to be permitted to sell the property that has been held as a security for the debt; in case of mortgage loans, the mortgage lender would sell the house where the mortgagor lives (Bodie *et al.*, 1992).

The process of securitization involves many investors with receivables of high quality; the seller usually continues to service the receivable. In the management of an ABS, a *trustee* ensures the orderly payment of interest & final payment of interest. The *issuer is often a trust or SPV* whose only business activity is to acquire and hold the assets, and issue securities backed by the assets. Costs associated with establishing a trust or SPV include underwriting fees, servicing fees and other costs. *Originator* initially owns the assets engaged in the deal. The transfer of assets from sponsor (originator) to SPV should constitute a 'true sale' to avoid bankruptcy challenges. Securitization separates the assets from the originator. The largest sectors of the ABS market in the US are securities backed by Credit Card receivables, Auto Loans, Home Equity Loans, Manufactures Housing Loans, Student Loans, Small Business Administration Loans, and Bond Obligations (Sharpe *et al.*, 2004).

Special Purpose Vehicles (SPVs) play a key role in enhancing the cash flow payments to the investors when a securitization contract is created. They simply ensure that the investor gets the most out of the deal. They would modify the loan terms or even recommend foreclosure as part of administration of the deal. In most cases, investors would control the appointment of the special server. They simply maximize the position of the investors. To minimize agency conflicts, the special servicer usually holds a portion of the first-loss piece in order to align the incentives of the investors and the special server. The first-loss investors are the ones who stand to lose a lot if the mortgage borrowers default (Ambrose *et al.*, 2006).

Rating Agencies are active players in securitized transactions. These agencies provide an outside perspective (which is also unconditional) on the risks involved in the securitized issue. They publicly disclosed their rating criteria for the subprime mortgages though the investors lacked the ability to evaluate the efficacy of the models used. Most of the products offered to subprime borrowers were very complex and subject to misunderstanding and/or misrepresentation (Ashcraft & Schuermann, 2008). The Rating Agencies assist in structuring the transaction by offering credit enhancement. Rating agencies are important since they provide an outside perspective of the risk exposure of the prospective investors. Such agencies mandate changes in the loan servicing procedures. The nature and amount of credit enhancement depends on the risk of the securitization as determined by the Rating agencies. These agencies give an outside perspective on the liabilities being created and allow the investors make a more informed decision. The rating agencies grade the issues into different tranches: the Seniour tranche (which is paid off first incase anything happens) is followed by the mezzanine tranche then the junior tranche which is most likely to be impacted by default- this is usually held by the originator (Zywicki & Adamson, 2009).

Citing Standard & Poor (2008), Mandel, Morgan and Wei (2012) define *Credit enhancement* as a protection, in the form of financial support, to cover losses on securitized assets in adverse conditions. If estimated losses are high, then more enhancements are called for to achieve a given rating, all else constant. Credit enhancement is meant to reduce the risk to the investors and thereby increasing the rating of the securities. A company that does not want to issue bonds directly (this requires a lot of disclosure) can engage an insurance company to put its credit behind the corporation for a fee. The firm can then float a bond of "enhanced" credit rating directly to the public. Credit Rating Agencies rate the securities in order to provide an external perspective of liabilities being created and help the

investor make a more informed decision. The fact that a securitization has an AAA rating does not mean it is risk free –it only means that the chance of a bondholder incurring a loss attributable to default on the underlying assets is remote (Riley & Brown, 2006).

Bodie *et al.* (1992) indicates that credit enhancement could take several forms which include: overcollateralization (whereby the amount of over–collateralization, which is usually 5% to 10%, is often determined by the rating agencies and underwriters depending on the receivables), seniour/ subordinate structure (Subordinate or secondary classes of securities are lower rated and bear higher interest rates and if a problem arises, higher rated (seniour) securities receive payments prior to the lower rated subordinate securities), liquidity provider (this requires a guarantee by the originator that is the entity that either generates receivables or assembles portfolios of receivables or another entity of all or a portion of payments due on the securities) and cash collateral account (whereby the originator deposit funds in an account with trustee to be used if proceeds from receivables are not sufficient).

2.2 Regulatory Failures leading to the Subprime Mortgage Crisis

Regulatory intervention may often be justified on the premise of financial markets being inefficient. Market systems are not always informationally efficient since information asymmetries are a common feature of most markets and information is a public good whose supply is often insufficient (Stigliz, 1993; Lofgren *et al.*, 2002). Liberalization of financial markets is intended to facilitate efficient allocation of resources. The existence of market failure does not necessarily justify government intervention since such failures are not directly attributed to market problems; instead, they are often seen to be associated with regulatory failure (Stigliz, 1993).

Dowd (2009) indicates that US policy failures contributed much to the subprime mortgage crisis. Dowd notes that *misguided intervention by the federal government* in the US housing market was largely to blame for the crisis. With an ambitious desire to increase home ownership (especially to the low income households who to a great extent did not have a repayment ability), the US government introduced some key interventions including: the mortgage interest deductions in the tax code, affordable lending requirements (contributing to laxity in screening of mortgage borrowers) and the enactment of the Community Reinvestment Act of 1977 which put a lot of pressure to bankers to advance mortgages to individuals with poor credit. Consequently, the US interest rates declined from about 6% to 1% in the pre-crisis and crisis period).

The abuse of securitization in the US mortgage market led to huge investor losses and bankruptcies. The mortgage lenders were accused of lending without proper credit risk appraisal leading to subprime loans (Purnanandam, 2009). During this period, most of the beneficiaries were advanced huge amounts of loans than their repayment ability could justify. The loan originators were equally to blame for lending with an intention of selling the loans off their balance sheet in the short run. They therefore lacked the incentive to obtain the necessary information from the prospective borrowers before lending. When the originators found that they could sell off the loan receivables, their lending practices became rather mechanical hence the proliferation of subprime loans. The SPVs (which bought most of these loans), became the victims of asymmetric information since they could not tell that the loan originators had actually generated mortgage loans with an intention of selling them off their balance sheets in the short run (An *et al.*, 2010).

To achieve the objective of promoting home ownership to most of the American citizens, the federal government established massive government mortgage enterprises sponsored by the government (especially Fannie Mae and Freddie Mac). *Fannie Mae* was set up in 1938 to expand the ability of residential mortgage finance. Its primary role was to buy mortgages from the loan originators and hold them- the institution was later privatized in 1968. *Freddie Mac* was set up in 1970 with the objective of expanding the availability of residential mortgage finance primarily through securitization of S & L mortgages. With huge government support, lower capital requirements and several legal privileges, the two institutions were able to gain significant control of the US mortgage market and consequently contributing much to the growth of mortgage securitization (Dowd, 2009). In year 2002, the Department of Housing and Urban Development imposed “affordable housing quotas” which encouraged Fannie

Mae and Freddie Mac to further increase their huge holdings of subprime portfolios (Mitchell, 2008). *The Greenspan Doctrine of 2002 was also to blame* since it held that the Fed could do nothing to stop asset bubbles from occurring but would stand by to cushion the fall if they did occur (Dowd, 2009). Bubbles are price increases which are far beyond the asset’s true fundamentals.

2.3 Theoretical Review

This section presents an overview of theories that inform the securitization process in mortgage markets. In view of the subprime mortgage crisis of 2007-2008, the *Securitizer-First and Lender-First theories* apply. Bubb and Kaufman (2009) extensively explore the role of credit score cut off rules in screening borrowers. They subsequently develop Securitizer-First theory to incorporate the concept in the screening process. In a securitization deal, the lenders may lack the incentive to properly screen borrowers and obtain relevant information if they intend to sell off the loans in an active secondary mortgage market. The use of *borrower credit scores* facilitates measuring their default risk with higher credit scores indicating a lower chance of default.

The *Securitzer-First theory* was first put forth by Keys, Mukherjee, Suru and Vig (2008). The theory posits that secondary-market mortgage purchasers employ rules of thumb whereby they are exogenously most likely to purchase loans advanced to borrowers with credit scores just above some cut off. By extension, lenders will similarly adopt a screening cut off rule in response. In view of this theory, securitizers exogenously use credit score cutoff rules in their purchase decisions and such rules compel mortgage lenders to utilize screening cutoff rules to enhance the value of loans sold off (Boston Fed, 2009). This is due to the Securitizers' demand for loans with credit scores above some certain thresholds despite their use of rules of thumb in the market. Since the mortgage originators know that they are unlikely to keep the loans above these credit score thresholds (due to their sale in the securitization markets), they will adopt weaker screening standards for such loans. Conversely, they will apply more stringent rules in screening borrowers whose scores are below the threshold point since such loans would remain unsold and into their portfolio (Bubb & Kaufman, 2009; Boston Fed, 2009). A moral hazard arises since lenders have knowledge of their malpractices in obtaining borrower information and their loan screening incentives unlike the securitizers.

An alternative theory is the *Lender-First theory*. In view of this theory, private mortgage securitizers adjust their loan purchases around the lender screening threshold in order to maintain lender incentives to screen (Boston Fed, 2009). When lenders are encountered with a fixed per-applicant cost of obtaining additional information about each prospective borrower, the cutoff rules in screenings will increase endogenously. Since lenders will get a higher pay off in collecting more relevant information for high credit risk borrowers, they will be more inclined to collect more additional information for those borrowers whose cutoff scores are below the thresholds. Heuson, Passmore and Sparks (2000) indicate that credit scoring improves the quality of information and that their empirical investigation found a negative correlation between mortgage rates and volume of securitization implying causation in that greater securitization reduces mortgage rates. The Lender-First theory thus predicts that the volume of loans advanced and their rate of default will be significantly lower for borrowers with cutoff scores below the threshold since much of the lenders information search efforts are directed to this category (Bubb & Kaufman, 2009). The theory is therefore a more likely explanation for the cut off rules.

The use of *FICO scores* is a popular measure of credit risk in order to inform lenders on which loans need increased credit screening. Straka (2000) indicates that the use of FICO scores became more popular (in practice) in the mid-1990s. A FICO score is a summary measure of an individual borrower's creditworthiness based on their credit history with higher credit scores indicating higher creditworthiness. In most cases, a FICO score of 620 is considered as the threshold. Interestingly, a research conducted by *Fannie Mae* (to ascertain the relationship between FICO scores and mortgage performance) showed that despite the borrowers with FICO scores of less than 620 representing only a small percentage of the total, they actually contributed to about 50% of the total defaults. In 1997, *Fannie Mae* provided further guidance to lenders by proposing 3 tiers of FICO scores: borrowers with FICO scores of above 720 had a 'very low' default risk, those with FICO scores between 660 and 719 had a 'low' default risk, those with FICO scores between 620 and 659 "represent a high degree of default risk" while borrowers with a credit score of 620 represent a "very high" risk of default (Fannie Mae, 1995).

3. Empirical Literature

3.1 Commercial Mortgage-Backed Securities and Special Servicers

Ambrose, Sanders and Yavas (2006) empirical study was intended to investigate the impact of conflict of interest on servicing non-performing loans. Their sample was made up of 46,082 loans in 363 CMBS deals obtained from the Intex CMBS database- most of the loans were originated between 1997 and 1999. In total, 27,275 loans had different master and special servers, 25,673 had a master server who also performed and carried out other special servicing roles for other loans, 1,602 loans had a master server that did not also perform special servicing functions for other loans while 17,044 loans had a special server that only performed special servicing functions for loans in the database (Ambrose *et al.*, 2006). First, the authors note that the servicing of loans in a CMBS transaction could further involve a sub-servicer (who is assigned special functions) besides the main servicer. The *Special Servicer* would take the administration of the loan by either recommending the modification of its terms of a foreclosure. They hypothesize that the default risk is highly correlated to whether or not the master servicer and special servicer of the pool are the same firm. Ambrose et al (2006) indicate further that there are moral hazards and adverse selection problems when the two roles of master and special server are held by the same firm- their findings prove their hypothesis to be true.

In a CMBS deal, the master server is meant to oversee the overall administration and monitoring of the underlying loan and the dispatch of cash flows to the investors in the tranche. However, in the event of a loan in the deal failing to perform to expectation, the master server forwards the same to the special server who has the rights to restructure the repayment terms, force it to foreclosure or ensure maximum cash flows to the deal investors. The moral hazard factor becomes an issue where the master and special server will treat the loan differently depending on whether or not they are the same. Adverse selection arises where the willingness of the special server to bid for a risky pool may be determined by whether the master server has a high chance of also being the special server in the deal. Ambrose *et al.* (2006) contend that if the two servers were the same, then the special server will have more information about

underperforming loans and subsequently put in place more effective recovery measures. There are conflicts of interests between the two servicers when handling troubled loans- there are inefficiencies created when the two functions are held by the same firm leading to faster handling of defaulted loans. Consequently, this enables the master servicer to become more aggressive in bidding for a risky pool of loans if the same firm expects to be the special servicer. The master server in a CMBS deal supervises the regular cash flows from the loan and manages information and any interaction with the performing borrower.

The Ambrose *et al.* (2006) study was based on more than 46,000 securitized Commercial real estate loans and it eventually supports their hypothesis. They predict a positive correlation by utilizing 46,082 securitized commercial real estate loans in 363 CMBS deals to test their conjecture. The study found that the time a loan remains in default is much shorter when servicing rights are held by one firm comparative to when they are held by two firms. The empirical study analyzes the correlation between default probability of a pool of loans and whether the two servicing rights are held by the same firm. They operate with the premise that servicing firms prioritize maximize their profits in their activities.

3.2 Asymmetric Information, Adverse Selection and Pricing of CMBS
An *et al.* (2010) document the 'lemons problem' in the real estate market. Their empirical investigation narrows down to the *CMBS* and the role played by *conduit lenders* in the abuse of the securitization process in the US mortgage subprime crisis of 2007-2008. Akerlof (1970) documents *quality uncertainty problems* in the automobile markets due to asymmetric information problems that is the 'lemons problem'. Akerlof uses the market for used cars as an example of the problem of quality uncertainty; owners of good cars will not sell their cars in the used car market for fear of not getting value for their good cars. This concept is often thought of as

"the bad driving out the good" in a market.

The An *et al.* (2010) empirical work sought to investigate originate-to distribute and originate-to-hold loans, the design of securitization in terms of excess leverage, opaqueness of securitized transactions and lax ratings. The empirical investigation was based on 142 CMBS deals and 16,760 CMBS loans in the 1994-2000 sample period. In particular, the sample included 13,655 conduit loans and 3,105 portfolio loans sold into securitization markets during the period 1994-2000. They found that CMBS investors paid a higher price for CMBS backed by such conduit loans comparative to portfolio CMBS deals. The study further found that the loan originators lacked the incentive to properly screen loans; most of the loans that were created were expressly for pass-through to securitization markets. There was no motivation to generate relevant private information on the quality of the loans. Theoretically, the An *et al.* (2010) study confirms that only low quality portfolio loans will be sold in the secondary market and their sales price incorporates a "lemons discount". Conduits gain from loan origination fees and do not mind so much about long-term returns that come with portfolio holding of loans. The empirical investigation found that in the period 1994-2000, CMBS investors paid higher prices for CMBS backed by conduit loans as compared to portfolio CMBS deals. By 1992, conduit lending constituted less than 5% of all CMBS. By 1998, conduit lending had grown to 75% and reached almost 100% by 2001. Downing *et al.* (2009) study similarly found that residential mortgage-backed securities sold by Freddie Mac to SPVs were generally of poor credit quality compared to those they retained in their portfolio. Freddie Mac simply used private information to sell "lemons" to securitization markets.

The An *et al.* (2010) empirical work found that portfolio lenders used private information to sell off lower quality loans to unsuspecting buyers. The study documents that conduit lenders originated loans with an express intention of selling them directly into the securitization markets. Since the buyers of the mortgage loans could not perfectly ascertain their quality (they could not also ascertain the credit risk of each loan), the sellers (originators) became more aggressive in selling off low quality loans while retaining the high quality loans for their own loan portfolio. Eventually, the securitization market was flooded with low quality loans which were to become uncollectible.

The sellers of these bad loans are expressly referred to as conduit lenders since they did not have an incentive to collect appropriate borrower private borrower information for loan appraisal since they knew that they were to sell off the loans soon after creating them (Stein, 2002). Their profits were mainly from the loan origination fees rather than the long-term returns associated with holding onto a portfolio of the loans. The An et al (2010) study confirms that their findings were consistent with those of Downing, Jaffe and Wallace (2009) who showed that residential mortgage backed securities sold by Freddie Mac to the SPVs were generally of low credit quality than those that Freddie Mac retained in its loan portfolio. Using an information-economics model, the study shows why conduit CMBS deals were priced higher than those CMBS deals kept for portfolio purposes and why conduit lending became the most popular source of loans in the CMBS secondary market. An *et al.* (2010) compare conduit lending to the Akerlof (1970) 'lemons problem' whereby the mortgage originators can separate poor quality loans from high quality loans and subsequently assign higher valuations for higher quality loans. Eventually, the market for lemons prescribes that lower quality loans will drive higher quality loans out of the market place.

4. Summary

The paper reviews literature on securitization process, the participation of several parties/institutions in the process and financial analysis of empirical work on creation of CMBS and ABS. The paper further provides an overview of the credit enhancement process and the role of SPVs, Special and Master servers in a securitized transaction. Regulatory failure, intentional malpractices on the part of loan originators and liberalization of the US financial market are cited as some of the key issues leading to the subprime mortgage crisis of 2007-2008. The paper documents reforms in the US housing market that precipitated the crisis such as the creation of Fannie Mae and Freddie Mac institutions. Securitizer-First and Lender-First theories form the theoretical anchorage of the paper. SPVs, Originators, Rating agencies and Trustees are identified as the key parties in the securitization process. The paper further captures the various moral hazards and asymmetric information conditions leading to creation of subprime loans. Relevant empirical literature on securitization and the crisis is reviewed in a nut shell.

Information And Communication Technology Capabilities And Performance Of The Parliamentary Service Commission Of Kenya

Enoch Bosire,

ebosire@gmail.com

Postgraduate Student,

Management Science Department

Kenyatta University

Dr. David Nzuki

nzuki.david@ku.ac.ke

Lecturer, Management Science Department

Kenyatta University

ABSTRACT

Parliaments operate in an environment that has transformed significantly with the arrival of technological innovations. It is on the basis of lack of understanding the impact of ICT capabilities on performance at the Parliamentary Service Commission of Kenya that the researcher intends to carry out this study. The purpose of this study is to evaluate the effect of information and communication technology capabilities on performance at the Parliamentary Service Commission of Kenya. The specific objectives will be communication services, digital capturing, and automation of processes. This study will adopt a descriptive research design. The target population of this study is 1018 employees of the Parliamentary Service Commission of Kenya. A sample size of 305 employees which is a representation of 30 percent of the population will be used. Stratified random sampling will be employed in selecting the sample of the study. Primary data for the study will be collected by use of a semi-structured questionnaire whereas secondary data will be collected through reviews of empirical books, journals, magazines and the internet. The study will use Cronbach's alpha methodology to check for reliability based on internal consistency of the research instrument. The data will be analyzed using descriptive and inferential statistics. The key beneficiaries of the outcome will be the PSC, Academia and policy makers.

Keywords: ***Communication services, digital capturing, automation of processes, performance***

1.0 INTRODUCTION

1.1 Background of the Study

Performance is defined as the continuous monitoring and reporting of program activities, mainly developments towards target goals conducted by a program (Alam & Noor, 2009). Alavi and Carlson (2012) refer to performance as a set of tools developed by organizations for better decision making. Organization performance on the other hand refers to how well a company attains its financial and market-oriented goals. Worth noting is that it is quite possible to distinguish between past and future performance in an organization. Past performance does not necessarily guarantee that it will remain superior in the future.

ISBN 978-9966-132-53-6 @ Copy Right .2019

Bloom et al. (2014) highlight that an organizations performance is mainly measured by the following indicators: market share, sales growth, profit margins, average selling price, return on investment, return on sales, product quality, and competitive position in market. An organizations performance can be measured in two categories namely financial and non-financial measures. In most practices an organizations performance can be measured through financial measures and strategic measures. Some of the non-financial measures used include measures such as: customer satisfaction, employee satisfaction, environmental performance, efficiency, effectiveness and social performance (Bloom et al., 2014).

1.1.1 ICT Capabilities

Brynjolfsson and Hitt (2013) define information and communication technology (ICT) as a family of technologies used to process, store and disseminate information, facilitate the performance of information related to human activities serving the general public and business sectors. ICT plays a very critical role in tackling economic challenges faced by both government and private sector of any country. ICT benefits are also related with viable and competitive businesses. The same applies to parliamentary service commission, Information communication technology is highly fundamental to the competitiveness and overall success of the commission entity. The effective use of ICT provides the commission with competitive advantage. Implementation of information technology offers the PSC the ability to increase communication and coordinate of value adding activities with their partners using their own operations (Buhalis, 2013).

Introduction of new technologies in ICT has transformed the ways organizations conduct their businesses by introducing ICT. Castellacci (2016) posit that information and communication technology has a huge influence on present-day businesses. Application of ICT have resulted in new business models being put under the umbrella of new economy further leading to new tools that support the management of the businesses. Fundamentally, no large business exists without the use of an enterprise resource program system (ERP), or email and internet. As a result, it is worth noting that ICT has inspired new businesses and has also become an enabler for fast flow of information to support operations especially in the parliamentary service commission.

Advancement of ICT offers important opportunities for cost reduction, increased flexibility, increased response time, and improved customer services (Cordella, 2016). In his empirical study, Cordella (2016) found that ICT significantly influences organizations performance and it competitive advantage more so when it is well linked with the firm's objectives. Buhalis (2013) study revealed that ICT impact is based on existing relationship between partners. ICT is

known to advance coordination between members where trust and long-term commitment in between partners exist. Therefore, information communication technologies have an enabling effect on the day to day operates of a commission entity. It leads to a high degree of collaboration, communication and coordination which are crucial to the performance of an entity.

Brynjolfsson and Hitt (2013) contend that ICT is crucial in improving information sharing and decision making in organizations. The use of high levels of technology results in high levels of information sharing in organizations. Nonetheless, technological aspects of information sharing systems do not always enable coordination and sharing of disaster related information because information sharing is not only a technological issue but an organizational concern. City agencies like most government institutions have neglected technological aspects to create an environment whereby data flows across functional boundaries.

ICT offers organizations flexibility to redesign processes while creating a high performing organizational design. The organization's flexibility results from ICT enabled information processing capabilities that have been unavailable when designing business processes. Information and communication technology facilities provide a common data sharing and exchange across the organization, offering work cells with the ability to access all functional data significant when completing their tasks (Castellacci, 2016). Having broadband networks for instance, allows free flow of information enabling timely sharing of critical data with employees in different location. Having a decision support system in place improves organizational decision making through effective analysis of vertical data sharing.

According to Buhalis (2013), performance of an information technology based coordination system is measured from many different perspectives and at different levels. Coordination between business partners involves at least two perspectives and three levels. The three levels include: individual, firm, and supply chain, while the two perspectives are economic and social perspectives. Economic perspective defines performance in regard to time and costs related measures. Defining performance from a social perspective includes aspects such as user satisfaction, non-economic organizational goals, and partnership quality.

1.1.2 Performance

Alam and Noor (2009) argue that operational performance involves all non-financial firm outcomes while organizational performance encompasses all economic outcomes of a firm. Operational performance greatly impacts on customer satisfaction and market share of an organization. As a result, operational performance can be measured by inventory turnover, production cycle time and other non-financial components of business processes. Some

ISBN 978-9966-132-53-6 @ Copy Right .2019

commonly used methods of measuring operational performance include quality circles, balanced scorecard, and best practices. The activities aid in monitoring the progress of a firm against the set goals and objectives.

It is critical to note that performance measurement should be evidence-based and specifically focus on well-established organizational goals and objectives. Alavi and Carlson (2012) grouped performance measures into six types: productivity, effectiveness, safety, timeliness, quality and safety. They also insist that performance measurement should be aimed at implementing and communicating performance standards through effective actions. Over the years, operational performance measures have been adopted in various organizations in the public sector. However, few studies have been conducted on their effectiveness in achieving organizational goals. Today's citizens are enlightened and constantly demand evidence of program effectiveness as a form of performance measurement from government institutions.

Parliaments" main role apart from making laws is imposing taxes and allocating money for public benefit. When taxes are paid and money is spent but the desired results are not attained, it is then the responsibility of Parliament to find out why since if no taxes were imposed then there wouldn't be resources to divert (Sigei, 2013). It is therefore Parliaments responsibility to ensure proper collection of taxes and spending of public funds. Therefore, it is mandatory for Parliament to ensure that budget execution is monitored and performance audits conducted so as to assess results achieved.

1.1.3 Parliamentary Service Commission

Parliamentary service commission as presently constituted was established under sections 45A and 45B of the former Constitution of Kenya. It consists of the Speaker of the National Assembly (SNA) as the chairman, a vice-chairman elected by the Commission from amongst its members, the leader of Government business in the Kenya National Assembly (KNA), the leader of the opposition party with the highest number of seats in the National Assembly or a Member of the Assembly deputized by him and seven members appointed by the National Assembly from amongst its members (S. 45B (1)). The Clerk of the National Assembly (CNA) is the Secretary to the Commission (Sigei, 2013).

In developing countries particularly in Kenya, parliamentary service commission (PSC) time and again lack the human capacity needed for effective ICT implementation. Researchers have discovered that lack of awareness; uncertainty of ICT benefits, set-up costs and pricing issues and security concerns are the most visible issues to ICT performance. Moreover, research studies on ICT performance by parliamentary service commission in Kenya reason

ISBN 978-9966-132-53-6 @ Copy Right .2019

that economic, political uncertainty and cultural factors are issues for ICT performance (Ajzen, 2011). From technological perspective, a PSC should have at least someone within the commission who has reasonable amount of knowledge for technology in general. Therefore, without internal technological capabilities, utilization of ICT applications might be difficult and sometimes dangerous in terms of system maintenance failures. The opposite is to seek advice and support from IT professionals but most PSC do not simply afford to do that because of the relatively high cost.

From managerial perspective, PSC further lacks managerial understanding and skills. Bagozzi (2015) posit that PSC ought to wholly reshape its current systems since ICT performance projects are naturally complex. The successful performance of e-business needs restructuring of business processes and redefinition of core competence of the entire commission. Undertaking changes in ICT cannot be successfully implemented without relevant skills and visionary mindset. More often managers at the PSC set their decisions on current needs and situation. The decision making process of the managers is spontaneous based on instinctive decisions and less dependent on formal models of decision making. Managers tend not to pass information and to delegate decision making authorities to their inferiors rather they are the only individuals with authority, responsibility and access to the information necessary for identifying business opportunities and utilizing ICT for performance.

Empirical studies indicate that ICT could have a positive impact on parliamentary service commission owing to the many benefits it offers its users and providers. Among the benefits derived from using ICT is the enhancement of operations and activities of the commission pegged on the reduction in overhead expenses. However, the benefits from ICT application in enhancement of the commission services is not only cost reduction but also the innovation found to have significant contribution to giving access to customers living outside the network and create opportunities for effectiveness (Chau and Hu, 2012).

ICT creates possibilities in regard to communication between citizens and parliamentarians and also with various government bodies. ICT provides means for more efficient and thorough work in which can make scrutiny more detailed (Davis, 2016). Therefore, ICT can support members of parliament (MPs) can easily and effectively scrutinize the government. Email overload is among the challenges facing MPs, email overload becomes a problem where the link between MP and constituency and high level of ICT usage and ability to deal with high levels of information.

ISBN 978-9966-132-53-6 @ Copy Right .2019

1.2 Statement of the Problem

The main mandate of the Parliamentary Service Commission (PSC) is to facilitate the work of Parliament by ensuring provision of support services to the House and its committees so that Parliament can exercise its powers in full. The PSC further works to enhance dignity of Parliament while informing the public of the Parliamentary activities. When discharging its functions, PSC safeguards transparency, non-partisanship, and a high sense of professionalism. However, Sigei (2013) indicated that the challenges that have undermined the effectiveness of the Commission include lack of adequate qualified staff, and the lack of capacity of Parliamentarians to effectively conduct their oversight responsibilities, lack of mobility and the need to upgrade the House's Information Technology (IT).

In contrast, in any organization, ICT need to be viewed as a key strategy to staying competitive. Meville et al. (2004) affirmed that the use of ICT results in high performance thus presenting new opportunities for organizations. Apulu and Latham (2010), claim that ICT adoption enhances firm's performance. Therefore, ICT brings changes in an organization making it more competitive, innovative and assist to increase organizational performance. Onyango (2013) did a survey on challenges of implementing strategic plan at salaries and revenue commission and revealed that staff need to be trained in order to motivate their contributions in implementing strategic plan. Mwangi (2015) conducted a survey on organizational culture on performance at lands commission. The study found that that organization believes, values and norms affect the performance of the commission. It is against this background that this inquiry sought to establish the impact of ICT capabilities on performance of parliamentary service commission of Kenya.

1.3 General Objective of the Study

To determine the impact of ICT capabilities on performance of the parliamentary service commission of Kenya.

1.4 Specific Objectives of the Study

i) To establish the influence of communication services on performance of parliamentary service commission of Kenya.
ii) To determine whether digital capturing has an effect on performance of parliamentary service commission of Kenya
iii) To find out the effect of automation of processes on performance of parliamentary service commission of Kenya

1.5 Significance of the Study

This study will help the commission understand better how ICT capabilities impact performance. The study will update the commission on the current issues that contribute to the existing gap. The findings of the study will be used by the commission to serve as a benchmark in setting standards for performance.

This study will enlighten other government institutions and commissions on the influence ICT capabilities have on their overall performance. If followed, the study findings as well as the recommendations will assist the institutions improve their performance.

The study will also be beneficial to academicians, future researchers and scholars by offering reference to the area of ICT and organization performance.

1.6 Scope of the Study

The study will focus on the impact of ICT capabilities on performance of parliamentary service commission of Kenya. The study will be limited to parliamentary service commission. This will involve undertaking an in-depth study based on quality service, service delivery and cost reduction between ICT capabilities and performance. This study will be based at parliamentary service commission in Nairobi. Further, the study will be carried out in Nairobi City County Assembly, the capital and largest city of Kenya. Nairobi County differs in several ways from other Kenyan counties since it is entirely urban. The study will target lower, middle and top management staff of the commission who will be sampled using stratified random sampling technique. A semi structured questionnaire will be used to collect primary data. A questionnaire is preferred as the research instrument since it is convenient for collecting data in a short time.

2.0 LITERATURE REVIEW

2.1 Introduction

This chapter highlights the relevant literature, information and other studies carried out in the field of ICT capabilities by various institutions, scholars, and researchers and provide detailed discussion on theoretical review, empirical review, research gaps and conceptual framework.

2.2 Theoretical Review

ICT capability is usually influenced by various theories which were developed by different scholars and authors. Although all the theories are necessary, they may or may not apply jointly during ICT process. Outlined below are key theories considered in this study which are seen to greatly affect ICT capabilities by various organizations.

2.2.1 Technology Adoption Model (TAM)

Technology adoption is one of the mature area of research in information systems. Davis and Venkatesh, (2016) has defined technology adoption as the 'stage of selecting a technology for use by an individual or an organization'. With rapid strides being made in technology innovations in every conceivable domain, the issues related to technology adoption have gained increasing prominence in recent times. Huge investments are made by organizations and governments for introducing new technologies that have the potential of bringing a paradigm shift in the life style of the users. However, these investments may not yield results if the innovations are not adopted by the intended users. More recent examples are that of cloud computing and e-Government (Venkatesh *et al*., 2016) that were promising in respect of the advantages they offered to the users but still have not been adopted by the users to the extent expected.

Several studies have revealed that technology adoption is not related to the aspects of technology alone but has evolved as a much more complex process involving dimensions of user attitude and personality (Venkatesh *et al*., 2016), social influence (Ajzen, 2011), trust and numerous facilitating conditions. It is necessary to understand the evolution of this research area in Information Systems and look at future research opportunities. Technology Adoption Model (TAM) has been widely used in technology adoption studies. The strength of the model lies in its simplicity as it has only two constructs, for instance perceived usefulness and perceived ease of use for predicting extent of adoption of new technologies at individual level. These constructs are derived from Dewan and Chen.(2015) which defines perceived ease of use as the judgments of how well one can execute courses of action required to deal with prospective situation and from Goodhue and Thompson (2015) paper which defines complexity as the degree to which an innovation is perceived as relatively difficult to understand and use.

ISBN 978-9966-132-53-6 @ Copy Right .2019

TAM became well established as a robust, powerful, and parsimonious model for predicting user acceptance (Han (2003). Presented a meta-analysis of TAM and found that it is a valid and robust model with applications in a wide range of areas. Henderson and Divett (2013) carried out a comparison of TAM and UTAUT (Venkatesh *et al*., 2016) and found that focus is now shifting away from TAM to UTAUT while citing in the research articles.

2.2.2. Unified Theory of Acceptance and Use of Technology (UTAUT)

Information technology pervades the international community from programmable home appliances to organization applications. Increase in technological innovation and application with awesome advantages brought changes to human life and work endeavours. As people, organizations and governments moved towards the use of Information Technology. Such move of change has increased the human computer interaction, which is the sole aim of performing a task (Lai, 2016). Interaction between humans and computers is affected by quite a number of human factors and its characteristics, to which studies have come up with theories and models to investigate factors that influence humans to use computers and its applications.

The design, development and acceptance of information technologies have received substantial attention in the past few decades. Many theoretical models have been proposed to give explanations to end user's acceptance behaviour. The newest amongst them is the Unified theory of adoption and use of technology (UTAUT) by Venkatesh *et al.* (2016), which has been applied and empirically tested in different domains. Since its inception many empirical studies have been conducted using UTAUT. The model is believed to be more robust than other Technology acceptance model in evaluating and predicting technology acceptance (Venkatesh *et al*., 2016). Although, the model has been widely used, tested and validated, the outcome of empirical studies has been inconclusive in respect to the magnitude, direction and significance of the relationships amongst the model. In social sciences the issue of variety in statistical significance is common because of complexity in human behaviour. Therefore, mixed outcomes in different studies are not uncommon, but it does undermine the accuracy of the models, UTAUT inclusive. Consequently, identifying users" history towards technology acceptance is difficult and complicated for the academic and information technologist.

In addition, an empirical study by Al-Hakim (2015) suggests that performance expectancy, effort expectancy and social influence significantly predicts manager's intention to engage in knowledge sharing using website. In the same study, Heeks (2013) found behavioural intention to significantly predict use behaviour. Jaeger and Matteson (2010) examined the acceptance of mobile telephone and found that performance expectancy, effort expectancy and social influence are predictors of behavioural intention. Interestingly, the authors also found performance expectancy, effort

expectation, social influence and facilitating conditions as predictors of use behaviour. Mayer-Schönberger and Lazer (2013) further suggest that performance expectancy and social influence are predictors of behavioural intention towards consumer's acceptances of mobile advertising.

As much as some studies have supported that the four predictive factors of UTAUT predicts intention and use behavior, results from some other studies suggest otherwise. Prins (2011) studied the Use of Online Community Weblog Systems, the results indicated that scales for the four constructs in UTAUT including performance expectancy, effort expectancy, social influence, and facilitating conditions have invariant true scores across most but not all subgroups. The authors expressed need for caution when interpreting UTAUT.

2.3 Empirical Review

This section presents a review of other studies and researches pertinent to the current study. The section looks at communication services, digital capturing, and automation processes presented in section 2.3.1, 2.3.2, and 2.3.3 respectively.

2.3.1 Communication Services

Communication has been widely accepted by scholars and academics as the life hood of an organization, because communication is needed for exchanging information, exchanging opinions, making plans and proposals, reaching agreement, executing decisions, sending and fulfilling orders and conducting sales (Mathieson, 2011). When communication stops, organized activity ceases to exist, and individual uncoordinated activities return in an organization. So communication in an organization is as vital as the blood of life.

The rules, regulations, and policies of a company have to be communicated to the people within and outside the organization. Business communication is regulated by certain rules and norms. In early times, business communication was limited to paper work, telephone calls, etc., but now, with the advent of technology, we have cell phones, video conferencing, emails, satellite communications, etc. to support business communication. Effective business communication helps in building the goodwill of an organization (Legris, Ingham, & Collerettei, 2013). Hence, it is necessary that you think before you communicate, be an active listener, be focused on your audience; and in your response, and be brief.

2.3.2 Digital Capturing

According to Rogers (2015), a digital camera is similar to a traditional film-based camera, but it captures images digitally. When you take a picture with a digital camera, the image is recorded by a sensor, called a charged coupled device. Digital cameras have several advantages over their analog counterparts. While film rolls typically hold about 24 pictures, memory cards have the capacity to store several hundred or even several thousand pictures on a single card. Therefore, photographers can be much more liberal in the shots they take. Since the images are captured digitally, unwanted images can be deleted directly on the camera. Most digital cameras also include a small LCD screen that shows a live preview of the image, which makes it easier to capture the perfect picture. These cameras usually include an option to record video as well.

In the past, people would need to drop off their film at a photo processing location in order to get their pictures developed. Legris *et al*. (2013) suggested that with digital cameras, you can simply import the pictures to your computer through USB cable. Once the digital photos have been imported, you can publish them online or e-mail them to friends. You can also edit them using photo editing software. If you want to print hard copies of your photos, you can use a home printer or an online printing service.

A video capture is a digitized version of an external video feed. Capturing video usually requires encoding or post-production software in addition to whatever hardware is being used to transmit the original feed into its digital file format. a capture is essentially a quantized and/or compressed version of some external source (Alam *et al.*, 2009). Within the scope of that description, a video capture can include a camera recording as well as that recording's transformation into an encoded, playable file. Typically, however, in the realm of video production and post production, the capture process describes when an external video feed is digitized. Within the context of digital video production and encoding, video captures can involve tape-to-file capturing as well as capturing from a variety of other media sources (Alam *et al.*, 2009).

2.3.3 Automation of Processes

Office automation is generally considered to refer to the use of integrated computer and communications systems to support administrative procedures in an office environment. Automated office systems represent structured methods of handling business text processing and communications through an integrated network that may include word processing for generating correspondence, electronic message systems for person to person communication, teleconferencing services, facsimile transmission, electronic filing systems, on-line calendar systems, and links to corporate files and outside services (Alavi *et al.*, 2012). In the automated office, not only will office work be

ISBN 978-9966-132-53-6 @ Copy Right .2019

performed more efficiently, but the concept of office work itself will be altered. The greatest potential of office automation is not expected to be from the improvement of clerical and administrative tasks, but from the ability of managers to gain increased control over their operations.

Apulu *et al*., (2010) argued that there is critical need to improve the productivity of both clerical and managerial office employees. While office costs have doubled in the last years, office productivity has risen only four percent. The interest in office automation is the increasing complexity of organizational decision making and information needs. The more traditional forms of communication such as telephone, mail, and person-to-person meetings may be ineffective for processing large volumes of information rapidly. In the future, this technology may be the only feasible way to deal with information processing in increasingly complex and rapidly changing organizational environments. In the restricted definition, automated office systems are generally based on interactive workstations connected to a communications network. The workstations have intelligence and storage capabilities managed either through a central computer or distributed to the workstation themselves. Workstation functions may be tailored to different roles, for instance, managerial, professional, secretarial, or even to individuals. Each workstation would have some degree of functionality of communications, text processing, and personal applications. Text processing capabilities of automated office systems are in common use today (Arvanitis *et al*., 2009). The features that prepare, edit, and store text will in the future be augmented by the ability to file documents electronically with cross reference indexes and keyword searching. Equipment for automatic facsimile transmission and automatic phototypesetting is also available.

However, personal applications include the capability for streamlining individual administrative tasks and are used by individuals at their own discretion. For instance, on-line calendar and scheduling programs which can be used to keep a record of an individual's schedule and, if feasible, compare schedules of multiple individuals in order to select meeting times. Reminder systems can be used for follow up on previous messages, for reminders of appointments based on the automatic calendar, and for tracking project schedules (Bagozzi, 2015). Personal contacts may be electronically fried with multiple reference indexes for retrieval in order to generate personal correspondence or obtain such information as telephone numbers. While the potential for office automation to improve office productivity appears compelling, such improvements will not accrue automatically. Designers emphasize clear objectives, proper planning, choosing an appropriate site for a prototype, eliciting the support and involvement of affected parties. Although there have been a number of major evaluations of the effects of automated office systems on office activities and communication patterns, little attention has been paid to its long- term effects on organizational functioning.

ISBN 978-9966-132-53-6 @ Copy Right .2019

2.4 Research Gap

On the organizational level, as aggregate corporate performance, ICT capabilities have been researched extensively. The results have become known as productivity paradox because the studies have not confirmed the expectations of a positive correlation between ICT capabilities and performance. There is increased use of ICT in most organizations ranging from formal, government and informal sectors of economy. Many organizations both national and international organizations are transacting online with improved technological development and innovation.

The available literature does not give enough evidence concerning the impact of ICT capabilities on performance rather most of them are dwelling on single business unit performance with most of them giving a general descriptive few of ICT without in-depth analysis of their impact. The literature shows that there is a little research, which has been done on the impact of ICT capabilities on the performance of parliamentary service commission in Kenya. Literature reviewed has not captured the influence ICT has had on parliamentary service commissions. The numerous studies done have dwelled on the impact of IT on organization performance and service delivery. This study intends to bridge the gap that exists and look at the impact of ICT capabilities on performance of the parliamentary service commission of Kenya.

2.5 Conceptual Framework

This section presents a summary of the variables in a framework revealing the relationships that exist. The independent variables of the study are and are not limited to: communication services, digital capturing, and automation processes. The main variables of the study will be communication services, digital capturing and automation processes. The variables will be considered in the study as independent variables which influence performance of the parliamentary service commission of Kenya.

ISBN 978-9966-132-53-6 @ Copy Right .2019

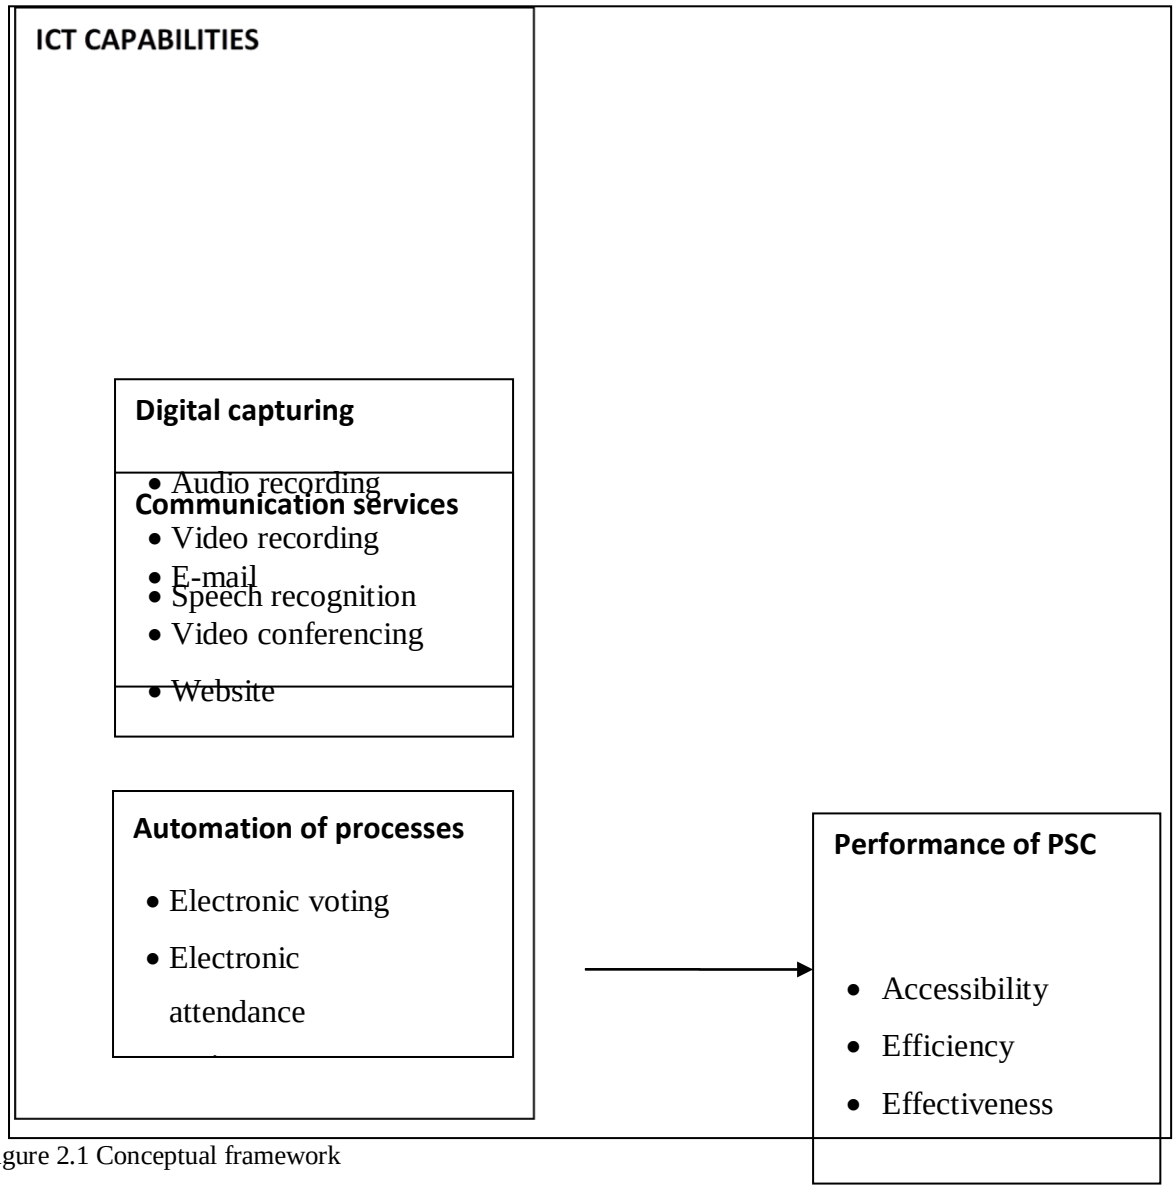

Figure 2.1 Conceptual framework

3.0 RESEARCH METHODOLOGY

3.1 Research Design

A research design is a plan outlining how information is to be gathered (Kisilu *et al.*, 2005). This study will employ the descriptive research design. A descriptive research design observes and describes the behavior of a subject without influencing it (Bryman, 2011; Burns and Grove, 2007; and Saunders *et al.*, 2009). The descriptive research design will be adopted as the study seeks to describe the characteristics of the PSC staff. The design will also establish the relationship between ICT capabilities and performance of the organization.

3.2 Target Population

The target population of this study will comprise of the parliamentary service commission staff (PSC). According to the PSC Human Resource Data (2018), the PSC has 1018 staff who will be sampled to get the number to participate in the study.

3.3 Sample and sampling Procedure

This study will use stratified random sampling to derive the number of respondents to use in the study. Kothari (2004) defines stratified random sampling as a process of selecting respondents by use of well-defined strata. In this study the organizations departments form the strata. Simple random sampling will then be used to select the individual from the strata. Simple random sampling is the process of selecting respondents to participate in a study without any particular sequence (Mugenda and Mugenda, 2003; Kombo and Tromp, 2010). According to Mugenda and Mugenda (2003), when the sample is huge, a sample of 30 percent of the accessible population is a good enough representation of the entire population. Therefore, a sample of 305 staff of the PSC will be used for the study and will be drawn from the strata presented in Table 3.1:

Table 3.1 Target Population

Department	**Population**	**Sample size**	**Percentage**
Hansard	132	40	13
Library	204	61	20
Research	102	30	10
Public communication	173	52	17
ICT	234	70	23
Media relations	173	52	17
Total	**1018**	**305**	**100**

Source: Parliamentary Service Commission (2018)

3.4 Research Instrument

This study will use a semi structured questionnaire to collect primary data from the respondents as recommended by Kothari (2004). Kothari (2004) terms the questionnaire as a research instrument that can be used to collect data from a large population in a short period of time. The questionnaire will contain both open ended and closed questions. The questionnaires will assure the respondents of anonymity while helping the researcher collect data in the shortest time.

3.5 Pilot Study

A pilot study is a small scale preliminary study conducted before the main research in order to measure the validity and reliability of the data collection instrument (Burns & Grove, 2007). It will be conducted to measure the validity and reliability. According Kombo and Tromp (2010), validity is the ability of an instrument to measure what it is expected to measure while reliability is the ability of the instrument to give consisted results. This pilot study will include multiple Likert's measurement scales. A sample size of five will be chosen, using triangulation, to form the pilot study.

3.6 Reliability and Validity of the Study

The study will carry out validity of the research instrument to ensure that it covers the topic under study. Validity refers to a measure of the degree to which a research instrument measures what its purports to measures (Kothari, 2009). So as to establish content validity, consultations with the supervisors will be done. Questionnaires as data collection technique will be piloted for such research to test for validity and reliability of data. According to Kothari (2004) pre-testing refers to the testing of the questionnaire on a small sample of respondents to identify and redefine potential questions and the employees used in the pilot test to be avoided in the final study. In order to check reliability of the results, study will use Cronbach's alpha methodology, which will be based on internal consistency. Cronbach's alpha will measure the average ofmeasurable items and its correlation. The current and desirable situation will be tested for the effects of ICT capabilities on performance with specific interest on parliamentary service commission. SPSS software will be used to verify the reliability of collected data. Cronbach's alpha reliability coefficient normally ranges between 0 and 1. However, there is actually no lower limit to the coefficient. The closer Cronbach's alpha coefficient is to1.0 the greater the internal consistency of the items in the scale. While increasing the value of alpha is partially dependent upon the number of items in the scale, it should be noted that this has diminishing returns. It should also be noted that an alpha of 8 is probably a reasonable goal. It should also be noted that while a high value for Cronbach's alpha indicates good internal consistency of the items in the scale, it does not mean that the scale is unidimensional (Kombo and Tromp, 2010).

ISBN 978-9966-132-53-6 @ Copy Right .2019

3.7 Data Collection Procedure

Data collection is the process of acquiring subjects and gathering information needed for a study; methods of collection varied depending on the study design, (Kothari, 2004). Primary data will be collected for this study. Primary data will be collected by administering a semi structured questionnaire (Mugenda & Mugenda, 2003). Secondary data on the other hand will be collected through review of both empirical and theoretical data from books, journals, dissertations, magazines and the internet.

3.8 Data Analysis

Data analysis will be executed using descriptive and inferential statistics. Data will be verified, coded and checked for any errors and omissions. The collected data will be analyzed using Statistical Packages of Social Sciences (SPSS) version 21.0. Responses from the questionnaires will be analyzed for descriptive statistics. Descriptive statistics shall adopt mean, standard deviation, percentages, and frequency of responses. Frequency tables, bar graphs and pie charts will be used to present the findings frequency distribution. Inferential statistics will be done so as to determine the relationships between the variables.

The functional relationship will be shown by using the multiple regression equation which takes the form:

$Y = ß_0 + ß_1 X_1 + ß_2 X_2 + ß_3 X_{3+} E$

Where:

Y	=	Performance
X_1	=	Communication services
X_2	=	Digital capturing
X_3	=	Automation of processes

Correlation models specifically Pearson correlation will be used to measure the degree of association between different variables under consideration and multiple regression analysis will be used to estimate the causal relationships between the chosen variables. Correlation will be used to measure the degree of association between different variables under consideration.

3.9 Ethical Considerations

All procedures and conduct in the study will be scrutinized and approved by the school of business, Kenyatta University. Consent for inclusion of subjects in this study will be sought through a consent form which will be read and/or presented to the informants for their approval or disapproval. Informants will be furnished with the purpose of

the study, confidentiality of the information will be provided, any foreseen and unforeseen risks, voluntary participation and withdrawal from the study at any stage without victimization. Anonymity of the subjects will be assured where the identity of the individuals is protected by using numbers. The study results will be made available to the world of academia in the university libraries.

Human Resource Management Practices and Performance in Public Secondary Schools in the Thika West Sub-County of Kenya

Eunice Warigia Ngotho - MBA (Kenyatta University)
eunnynicek@gmail.com

Dr. Rosemary Wanyoike – PHD (Kenyatta University)
Wanyoike.rosemarie@ku.ac.ke

Abstract
This research project aimed at investigating the effects of Human Resource Management practices on student performance in public secondary schools in Kenya. The objectives of the study are to: establish the effect of training and development on student performance in public secondary schools in Thika West Sub-County Kenya; Determine the effect of management style on student performance in public secondary schools in Thika West Sub-County Kenya; Assess the effect of performance management on student performance in public secondary schools in Thika West Sub-County Kenya and; determine the effect of compensation and reward on performance in public secondary schools in Thika West Sub-County Kenya. This study is based on three theoretical foundations: Expectancy Theory, Human Capital Theory and; McGregor's Theory X and Theory Y. The study adopts the descriptive survey design. The study sampled 100 teachers and 5 principles from the 13 public schools in the sub-county. The study collected both primary and secondary data using a structured questionnaires and interviews. Data from key informants is analysed thematically. Descriptive statistics, inferential statistics and Pearson correlation are used to analyse the data. On the first objective of the study, findings from Pearson correlation shows that training and development significantly affect student performance of public secondary schools and ($r=0.870$, $p<0.05$). On the second objective of the study, the findings show that principals' leadership styles contribute to student achievement indirectly through teacher commitment and beliefs about their collective capacity. In this regard, the findings from Pearson correlation shows that there was significant effect on performance of public secondary schools and management style ($r=0.648$, $p<0.05$). On the third objective of the study, the findings show that performance management systems positive and significant affect student performance (Pearson correlation, $r=0.844$, $p<0.05$). On the last objective of the study, the findings obtained show that rewards positively contributed to the performance of teachers (Pearson correlation, $r=0.885$, $p<0.05$). In view of the findings of the study it is recommended that the government should put in place mechanisms for enhancing progressive training and development for teachers. Effort should be made to ensure consultative, democratic and transformational leadership styles are promoted in schools. Performance management should also be strengthened in schools so as to enhance assessment and feedback among teachers. Lastly, teachers' salary increment proposals should be promptly implemented.

Key Words*: Performance; Training & Development; Management Style; Performance Management; Reward and compensation*

1.0 Introduction

There is decline in performance in KCSE examinations over nine years (2009 to 2017) in Thika West Sub-County

public secondary schools. According to Mwangi, 2015, trend analyses show that most of the schools scored far below the possible 12 optimal points in Kenya. Actually all the schools studied had a below average mean grade, (Mwangi 2015). According to Thika West Sub- County public and private schools performance Report (2016 - 2017) the performance went down from a mean grade of 5.519 in 2016 to a mean grade of 4.67 in 2017. It is thus imperative to empirically test the relationship between human resource management practices and performance of public secondary schools in Thika west subs county Kenya.

Shaun (2006) in his study based on desk review of available literature in the United States of America argues that there is an undeniable link between HRM practices that ensure that teachers are well equipped to become effective in their jobs and good performance in examinations. In the same accord, Kremer (2003) in a study on "Randomized Evaluations of Educational Programs in Developing Countries" shows that the efficiency of human resource management could affect the performance of such schools since it directly affects the quality of teaching. However, the studies by Shaun and Kremer do no focus on Kenya or on Thika West for that matter. As such, they may not expressly relate to this current study.

In the Kenya context, Gituathi (2012) studied human resource factors influencing pupils' performance in Kenya Certificate of Primary Education in Thika West District, Kiambu County, Kenya. The study shows that the performance of students in all aspects such as performance in examinations and other activities in the school can only be assured through the good HRM practices.

Conversely, Gituathi (2012) recommends that the government should invest in HRM practices that motivate teachers so as to enhance academic performance of such teachers in national examinations. Though focused on the same study area, Thika West, as this current study and also on human management practices, the study of Gituathi strongly differs with this current study. To begin with, her variables namely: teacher-pupil ratio; staff development (training); teachers' experience and teachers' classroom management slightly differs with those of this current study which focuses on management styles, training and development (though one of her variables), performance management and, reward and compensation. In addition, the study focused on primary school pupils unlike this current study that focuses on secondary schools. The study of Gitonga (2012) on "influence of teachers' motivation on students' performance in Kenya certificate of secondary education in public secondary schools in Imenti South District" was also outside the scope of this study since it focused on schools in a different area.

The fact that none of the studies reviewed focus on the HRM practices under investigation in this current study, it may be untenable to understand the effects of these variables on the performance of schools in Thika West Sub-County. This ought not to be so in the wake of poor performance among most public schools in the area. This current study sets to apply different variables to investigating the influence of HRM practices on the performance of secondary schools in the area."

2.0 Relationship between Human Resource Management Practices and Performance

Performance is an important aspiration for all schools globally. This owes to the fact that education utilizes huge portions of a country's budget. According to Orodho (2004), the importance of the gains anticipated from education cannot be gainsaid. This emanates from the fact that education is pivotal to economic development in a country. It is aimed at adding value to other resources through the development of the requisite human capital. In this regard, human resource management (HRM) practices play critical roles in education processes by enhancing the capacity of teachers to deliver.

According to Alarm and Farid (2011), HRM practices a central to the motivation of teachers. When teachers are intrinsically and extrinsically motivated, students are affected directly. This goes on to enhance the performance of these students. Furthermore, when teachers are motivated, their efficacy is enhanced. This is usually essential for enhancing the achievement of goals of education since teacher efficacy and students performance are strongly correlated as posited by Gituathi (2012).

Gillespie (2003) is of the opinion that meaningful performance cannot be achieved without clear performance indicators. Most HRM practices are aimed at facilitating the achievement of the goals of the organization such as schools in the case of this current study. A combination of efforts aimed at making teachers more equipped to deliver pedagogical targets would lead to goal-oriented teaching in schools. This occurs in the backdrop of teachers' reciprocal efforts in response to the motivation achieved through HRM practices (Grindle, 2009).

Human resource management practices and performance in the public sector have been proven to be intertwined in African countries such as Botswana, Ghana, South Africa and Uganda. When employees find themselves in

favourable working environments, they tend to deliver more on the set government performance targets (Salemi, 2007). This current study sets to investigate the level to which HRM practices would influence performance in public schools in Kenya. This is particularly important since billions of tax payers' money is committed to education in these schools. If HRM practices, which also utilize huge chunks of the national budget, do not translate to academic performance in public schools, then this would be waste of hard-earned public resources.

In Kenya, Gitonga (2012) argues that one of the ways of enhancing performance of teachers, and by extension that of students, is putting in place teacher-sensitive human resource management practices. It can thus be concluded that HRM practices contribute to an environment in which teachers can perform better hence students' good performance in the examinations. Conversely, Gituathi (2012) in a study undertaken in the country recommends that the government should invest in HRM practices that motivate teachers so as to enhance academic performance of such teachers in national examinations.

3.0 Human Resource Management PracticesEmployed in Public Schools

According to Schuler and Jackson (2007), *management* of *human resources affects the performance of schools. These resources are usually the employees of an organization, such as schools in the case of this current study. The two scholars however see it a* cosmetic measure since the HR Department, "more often than not, cannot guarantee a change in the management of their people as an asset which the concept prescribes. This issue, which is worth assessing in totality through the exploration and description of the HRM concept in practice and their influence on performance, forms the bases for this study." Despite the fact that there is plenty of literature in the field of human resource management, most focuses upon developed economies and tend to the neglect of developing economies.

This current study conceptualizes that numerous HRM practices are employed in public schools. These include training and development, management style, performance management and reward and compensation, as presenting in the following discourse. The joint effects of these practices are expected to contribute to the performance of teachers in such schools.

Training and development is an important HRM practice employment in most organizations. Ombui, Kagiri and Omoke (2014) studied the influence of training and development on the performance of employees in research institutes in Kenya. The findings obtained show that HRM practices are vital in enhancing the quality of workforce. In this regard, their study shows that training and development are positively correlated with the level of employee performance in the organization. The former study focuses on research institutes and may not show the state of affairs in secondary schools.

Management styles have also been proven to affect the performance of organizations. Various management styles influence the performance of organizations in various ways. Nave (2006) and, Thompson and Strickland (2007) and McNamara (2005), are of the view that effective leaders often improve the performance of organizations through meticulous implementation of the strategies of the organization. Among Kenyan Small and Medium Enterprises (SMEs), it is evident that the leadership style of the manager influences the performance of core business activities.

Performance management has also been shown to affect organizational performance. Caldwell (2004) points out that performance management enables organizations to put in place mechanisms for enhancing assessment and feedback among employees so as to enhance the performance of the organization. In this regard, effect performance management goes beyond just evaluation and feedback to inculcating a culture of feedback among workers. When this is done the performance of the organization is enhanced and vice versa.

Furthermore, the reward system, as advanced by the expectancy theory argues that employees expect certain rewards for their input. In this regard, human resource managers put in place a befitting reward system so as to motivate employees to expeditiously execute their duties. This is based on the assumption that the reward management practices have direct relationship with employee performance (Ali & Ahmad, 2009).

Armstrong and Murlis (2007) are of the view that as a result of the rewards accrued within the process of service delivery, employee performance can be enhanced. In this light, organizations put in place robust reward systems so as to tap from its associated gains in the current competitive environment. This is based on the fact that the centrality of employees in gaining competitive advantage in firms is indubitable. Conversely, Armstrong and Taylor (2014) argue that the rewards promised to employees (usually salaries or wages) increased the performance of the employee when their expectations have been met.

From the preceding discourse, it is evident that various HRM practices affect performance in organizations. Most of the studies reviewed do not attempt to link such practices and performance in public schools in Thika west Sub-

County which was the focus of this current study. As such, the findings and premises of these studies may not relate to this current study. This underlined the importance of this current study that investigates the influence of Human Resource Management Practices on the performance in public secondary schools in the area."

4.0 Objectives of the Study

In this light the study sought to respond to five objectives namely:

(i) To establish the effect of training and development on student performance in public secondary schools in Thika West Sub-County Kenya.
(ii) To determine the effect of management style on student performance in public secondary schools in Thika West Sub-County Kenya.
(iii) To examine the effect of performance management on student performance in public secondary schools in Thika West Sub-County Kenya.
(iv) To assess the effect of compensation and reward on student performance in public secondary schools in Thika West Sub-County Kenya.

5.0 Theoretical Underpinning

This study is based on three theoretical foundations: Expectancy Theory, Human Capital Theory and; McGregor's Theory X and Theory Y.*The expectancy theory* casts light on the effect of compensation and rewards on the performance of secondary schools in Kenya. The Expectancy Theory as pushed forward by Richard Oliver in 1974 posits that expectancy is "the probability that the individual assigns to work effort being followed by a given level of achieved task performance." The theory shows that there is a link between rewards and behaviour. In this case, it shows that compensation has the propensity to enhance job satisfaction.The expectancy theory relates to this current study since it shows that employees are likely to perform better when they are well motivated. As such, there should be efforts to come up with ways of ensuring that teachers are motivated through various methods such as rewards and compensations, which could go on to enhance their individual performance as conceptualized in this current study.

The human capital theory relates to the training and development as well as performance management variables of this study. Gary Becker advanced the human capital theory in 1962. According to this theory, the knowledge and skills that are offered to employees in training institutions are a form of as capital (Becker, 1994). The theory has also been expounded by Scott Sweetland in his book titled "Human Capital Theory: Foundations of a Field of Inquiry." In this regard, Sweetland (1996) opines that individuals and the whole society gain economic benefits from investments in people. In educational circles, human capital has been applied in the book, "human capital theory: implications for educational development" by Olaniyan and Okemakinde (2008).This theory relates to this current study since training and ensuring that performance management is undertaken so as to appraise and enhance the capacity of teachers to meet teaching requirements could contribute to better performance among such teachers as well as that of the students they teach.

McGregor's Theory X and Theory Y relates to the management style variable of this study. The theory, as postulated by McGregor (1960) consists of two alternative set of assumptions. Theory X is an authoritarian style of leadership where Theory X assumes that employees find working unpleasant and usually avoid working if possible. In this regard, it is assumed that under theory X, employees are directed and coerced to deliver their services within the process of achieving organizational goals such as learning objectives as in the case of this current study. As such, such employees lack motivation to perform.On its part, theory Y is a participative style of leadership. In this theory, employees are given liberty to work in their own pace and are constantly motivated to perform well. This emanates from the fact that it is assumed that threatening and external controls are not the only ways to make people work better to achieve organizational (Hofstede, 2005). This theory however relates to this study since it can be argued that the participatory forms of leadership could make teachers more motivated to perform their duties, hence enhancing their performance.

6.0 Research Methodology

The study adopts the descriptive survey design. The study sampled 120 teachers and 5 principles from the 16 public schools in the sub-county out of a target population of13 principals and 335 using sampled using the simple random sampling technique. The study collected both primary and secondary data using a structured questionnaires and interviews. A pilot study was conducted to pre-test data collection tools. In this study, a sample of 15 teachers was used. The 15 teachers were not included in the final study. The sample of 15 is informed by the work of Kothari (2004) which mentions that 10% to 30% of a target sample wassufficient for piloting a questionnaire.Data from key informants will be analysed thematically. Descriptive statistics, inferential statistics and Pearson correlation will be used to analyse the data.

7.0 Summary of the Findings

On the *first objective of the study* which was to establish the effects of training and development on student performance, it is evident that training and development affected teachers positively. The findings from Pearson correlation shows that there was significant relationship between performance of public secondary schools (the dependent variable) and training and development ($r=0.870$, $p<0.05$). This was due to the fact that training made teachers able to cope with emergent learning demands. It also made it possible for teachers to cope with emergent curricular requirements. This made such teachers able to offer quality learning to students, which went on to enhance the performance of the schools in national examinations and other learning activities.

On the *second objective of the study* which was to determine the effect of management style on student performance in public secondary schools in Thika West Sub-County Kenya, the findings show that principals' leadership styles contribute to student achievement indirectly through teacher commitment and beliefs about their collective capacity. In this regard, the findings from Pearson correlation shows that there was significant relationship between performance of public secondary schools (the dependent variable) and management style ($r=0.648$, $p<0.05$).

On the *third objective of the study* namely: to examine the effect of performance management on student performance in public secondary schools in Thika West Sub-County Kenya, the findings show that there was positive and significant relationship between performance management systems and employee performance (Pearson correlation, $r=0.844$, $p<0.05$).

On the *last objective of the study* which was to assess the effect of compensation and reward on student performance in public secondary schools in Thika West Sub-County Kenya, the findings obtained show that rewards contribute to the performance of teachers. Indeed, there is a direct relation between reward system and teachers' performance, which translates to the overall performance of the school (Pearson correlation, $r =0.885$, $p<0.05$).

8.0 Conclusion

On the *first objective of the study*, it can be concluded that training and development enabled teachers to use their acquired skills and talents better. This went on to enhance the performance of students. On the *second objective of the study*, it can be concluded that the management style practiced by the head-teacher affected the performance of their schools. If teachers were involved in making key learning decisions, such teachers go motivated to put in their best to the learning processes. This went on to improve the performance of the students. Furthermore, if students were treated well and their views taken into account when they had grievances, indiscipline cases were reduced. Students tended to work harder and this went on to positively enhance their performance. Lastly, if good school-community relationships were fostered by the school management, a good learning environment was created, they was tendency to check negative influences on students from the community such as selling drugs and alcohol to students. This went on to boost the performance of the students.

On the *third objective of the study*, positive ways of ensuring that the performance of teachers was assessed and improvements suggested encouraged teachers to work hard. When teachers' exemplary performance was identified and rewarded, the morale of these teachers was enhanced. This made such teachers put in their best in learning processes. The end result was better performance of the schools.On the *last objective of the study*, it can be concluded that based on the promises of rewards, teachers put in extra rewards due to enhanced morale. This resulted in better fulfilment of learning objectives with school syllabuses being completed in time. Student-teacher relationships were also enhanced since teachers tended to be well motivated. Teachers had fewer problems at home due to enhanced financial security. This means that there was less absenteeism among teachers. The combined effects of these factors led to better performances of schools in national examinations as well as in extracurricular activities such as games and sports.

9.0 Recommendations

In view of the findings of the study, the following recommendations are made. The government should put in place mechanisms for enhancing progressive between training and development for teachers. Policies for augmenting budgetary allocations for funding training and development through the Ministry of Education should be regularly enacted. Progressive review of ways of assessing and formulating emergent training needs for teachers should be put in place so as to ensure that training and development was mainstreamed in the Ministry of Education. On

management style there should be effort to ensure that consultative, democratic and transformational leadership styles were promoted in schools.

There was also need to put in place mechanisms for ensuring that principals involve teachers, parents and students when making key decisions in schools. In addition, adequate policies aimed at guiding performance appraisal of teachers so as to the performance in schools should be formulated by the government in close collaboration with all education stakeholders.

Performance management should be strengthened in schools so as to enhance assessment and feedback among teachers. Furthermore, follow up efforts for ensuring that the recommended made after all assessments undertaken in schools are implemented should be put in place. There should be synchronized rewards management frameworks in schools so that promotions, cash incentives and other forms of rewarding teachers should be instituted. There should also be ways of ensuring that teachers' salary increment proposals negotiated with the Teachers' Service Commission are promptly implemented. Lastly, the financial risks facing teachers should be mitigated through loans and other benefits so as to ensure the socioeconomic security of their families

Abstract

Purpose: The aim of the study was to explore the relationship between organizational resources and strategic plans implementation in Administration police service in Baringo County, Kenya.

Methodology: The study adopted descriptive research design. The population of this study was administration police officers deployed in Baringo County. The total number of officers was 720 found in six sub counties; Baringo Central 92, Baringo North 113, Mogotio 81, Marigat 223, Koibatek 128 and East Pokot 83. The aggregate sample size was 216. Data was collected by use of structured questionnaires adopting Likert scale formation. Data was analyzed mainly by use of descriptive and inferential statistics. Descriptive statistics included mode, mean, median, standard deviation. Inferential statistical techniques like correlation and regression coefficients were used to draw causal

relationship between the various organizational resources and implementation of strategic plans. Data was presented by use of graphs, pie charts and tables.

Results: The study findings indicate that organizational resources significantly influenced implementation of strategic plans. Financial, human, capital and technological resources greatly influence successful implementation of strategic plans in an organization.

Unique contribution to theory, practice and policy: The study recommended that there is need for increased funding of Administration police service in Baringo County both from the national and county governments. Job relationship between senior and junior officers should be improved. Government should ensure all housing facilities are operational, in good condition and enough. The study further recommends clear guidelines on implementation of reforms, community-based policing and improvement of guidelines on training, enhancement and capacity building.

Keywords: *Organizational, Resources, Strategy, Plans, Implementation, Administration Police Service*

1.0 INTRODUCTION

1.1 Back ground of the study

Strategy is the bearing and extent of an association over the long haul, which accomplishes advantage for the association through its arrangement of assets inside a testing domain, to address the issues of business sectors and to satisfy partner desires (Johnson & Scholes, 2002). An organization methodology comprise of the focused moves and business approaches that administrators are utilizing to develop the business, draw in and please clients, contend effectively, lead operations and accomplish the focused-on levels of hierarchical execution (Thompson JR, Strickland III & Gamble, 2008). As per Pearce and Robinson (2007), with the end goal for associations to accomplish their objectives and destinations, it is fundamental for them to conform to their condition through a system. Numerous associations today are concentrating on winding up more aggressive by propelling techniques that give them an edge over others by making winning procedures (Porter, 1996).

Implementation of strategic plans is one of the three primary periods of key administration (detailing, usage and control). It is the full scope of administrative exercises related with instituting a picked procedure, directing its interest and accomplishing the focused on comes about (Thompson JR, Strickland III & Gamble, 2008). As per Harrison and St. John (2004), it is the procedure through which associations examine and gain from their outside surroundings, build up vital bearing, make methodologies that are planned to help accomplish set up objectives and execute those techniques all with an end goal to fulfill key hierarchical bodies electorate.

Strategic plans implementation processes differ from one organization to another depending on the nature of business and management. Effective strategy implementation depends on competent personnel and effective internal organization systems (Aosa, 1992). Johnson and Scholes (2003) identified availability of resources, leadership style, organization culture, corporate structure, lack of focus and failure by strategy implementation team as some of the major challenges facing strategy implementation process in organizations. Therefore, evaluation of strategic plans implementation remains an important process in any organization given the available resources since it will identify difficulties and propose possible recommendations to counter them. To achieve desired objectives in an organization, adequate supply of financial, physical, human and technological resources is paramount (David 2003). An organization must comprehend and ascertain its main resources that will improve its competitiveness and sustainability for it to advance its performance (Rouse & Daellebach, 2009).

Strategy implementation is inextricably connected with organizational resources; financial, human, capital and technological (David, 2003). Nyogesa (2013), identified resources as a key component in implementation of strategic plans in NPS and proposed that the service should lobby for more resources and properly manage them with high levels of transparency and accountability. Technological resources have proved to be of great importance in implementation of strategies if properly managed by assisting in time saving and relaying of important information (Kipkurui, 2014). For effectiveness in administration of human resources there is need for regular staffing, training, enhancement and evaluation.

Administration Police Service is a governmental organization which is subject to environmental influence. The environment consists of other organizations that exert various forces of economic, political, or social nature which determine the organization's survival. According to Government Commissioned Reports in Kenya; (Ransely, 2008), John Krigler Report (2007), The Kenya police task force on reforms (2009) and Waki Report (2008) all indicated that the Kenyan Police had poorly adapted to changes in the external environment which called for greater demands to effectiveness and efficiency in the force. Implementation of reforms as part of APS strategic plan (2013-2017) poses a challenge to the service since the reforms are either slow or adopting a slow pace (Chtalu, 2014).

Currently, the service is operating under APS strategic plan 2013-2017(anchored in NPS strategic plan 2013-2017) which prioritizes on implementation of reforms in the service, strengthening of policy regime, development of physical facilities, application of ICT in policing work, improvement of staff welfare, capacity building and enhancement of officers, research and development in crime areas and changing police image and culture.

1.2 PROBLEM STATEMENT

Strategy implementation process is a standout amongst the most critical parts of key administration in light of the fact that without execution a system has no solid presence. Superb system execution is the best trial of administrative perfection and the most dependable formula for transforming organizations into standard entertainers (Thompson, Strickland III & Gamble, 2008). Excellent strategy has been seen as trying errand in numerous associations. Ngarachu (2008) stated that African nations are known for definition of plans, but they lack in achieving timely action or procrastinate in executing these plans which is attributed to leadership and strategic management. Major unpredictable changes faced by organizations today make strategy implementation a difficult and complex process. According to Harvey (2005), 80% of organization's directors believe that they have good plans but only 14% believe that they are able to implement them well. Mintzberg and Quinn (1999) noted that over 65% of organizational strategies fail to get implemented effectively which is attributed to the nature of strategic problems that an organization faces.

Administration police service is a branch of National police service with well formulated strategies laid down in NPS strategic plan 2013-2017 which ought to be fully implemented. Several studies have been done on implementation of the strategies and various observations made; Nyongesa (2013) conducted a research on challenges of strategy implementation in Kenya Police Service, a case study of Nairobi County and found out that the evolution of international terrorism, inadequate human resources, inadequate funding, inadequate modern security equipment, and change of Government rules and regulations were some of the factors affecting implementation of strategies in the service. Chtalu (2014) directed an exploration on the difficulties identified with police changes in Kenya: a study of Nairobi County and discovered that changes as a major aspect of vital destinations had taken a moderate stage and prescribed both government and the common society to set out on making maintained mindfulness battles on police changes both to the officers and the individuals from people in general.

KNCHR occasional report (2010-2014) observed that reforms of the National Police Service as relates to the welfare of police officers proposed in the Report of the National Task Force on Police Reforms (2009) were yet to be fully implemented which dampened the morale of officers. The report indicated that the reforms anticipated in the National Police Service, were proceeding at some very slow pace and police had not been equipped with sufficient resources and equipment to enable them discharge their functions effectively.

Moreover, it was noted that failure to fully institutionalize community policing served to alienate citizens from informing and participating in the formulation of strategies that could adequately respond to the crisis of insecurity faced by the country. From the above-mentioned studies, it is evident that implementation of strategic plans in NPS has not been fully achieved. It is on this background that this research sought to establish the progress made by NPS particularly APS in Baringo County in implementing its formulated strategies.

1.3 RESEARCH OBJECTIVE

The aim of the study was to investigate the relationship between organizational resources and strategic plan implementation in Administration police service in Baringo County, guided by the following specific objectives.

- **i.** To analyze how financial resources affect strategic plans implementation in administration police service in Baringo County.
- **ii.** To explore how human resources influence strategic plans implementation in administration police service in Baringo County.
- **iii.** To examine how capital resources affect strategic plans implementation in administration police service in Baringo County.
- **iv.** To determine how technological resources impact strategic plans implementation in administration police service in Baringo County.

2.0 LITERATURE REVIEW

2.1 Theoretical Review

2.1.1 Resource Based View Theory (RBVT)

The resource-based view of crucial organization is an explanation behind high ground of a firm which depends in a general sense on the usage of pile of beneficial generous or insignificant resources at the affiliation's exchange (Wernerfelt, 1984). To change a short-run high ground into an upheld high ground it requires that the benefits be heterogeneous in nature and not magnificently convenient (Peteraf, 1993). These satisfactorily changes over into imperative resources that are neither perfectly imitable nor substitutable without uncommon effort (Barney, 1991). Despite the way that, having heterogeneous and stable resources is essential in achieving high ground, it isn't adequate alone if the firm needs to help it.

Barney (1991) proposed VRIN structure that looks at if assets are important, uncommon, expensive to copy and non-substitutable. The assets and abilities that can meet the structure prompt managed upper hands. Assets are profitable in the event that they help associations to build the esteem offered to the clients. Assets that must be gained by one or few organizations are thought to be uncommon. Besides, the assets should likewise be exorbitant to impersonate or to substitute for an opponent if an organization needs to accomplish managed upper hand. Be that as it may, asset-based view contends that an asset without anyone else's input doesn't present any preferred standpoint for an association in the event that it isn't composed to catch the incentive from it. An association requires a powerfully developing port-folio of assets and capacities to support its aggressiveness and help drive changes in its execution (Thompson, Strickland III and Gamble, 2013).

2.1.2 Kurt Lewin's Theory

This theory was first proposed by Kurt Lewin (Kritsonis 2005) and is concerned with the forces that sustain balanced systems or those that break them down. Stable forces are dominant in a system maintaining status quo and if the system is to change it needs to reduce all stabilizing forces. Kurt Lewin's model involves three steps; unfreezing, transition and refreezing. Unfreezing involves breaking psychological detachments to the past by using information that demonstrates the existence of problems. This detachment is done by communicating existing problems and convincing the change implementers on the need to change the status quo. Transition refers to the recognition of a need to change, specifically cultural and structural changes and to establish new values and processes. Refreezing refers to the reinforcement of change in order to achieve a renewed equilibrium. At this stage new norms are established and a new way of doing things is achieved. Driving forces for change should be well formulated and communicated. However, the forces driving change should overcome those restraining it for successful implementation of strategic plans.

2.1.3 Mckinsey 7S Framework Theory

This theory was made in the mid-1980s by Tom Peters and Robert Waterman who were guides working at the Mckinsey and Company advising firm. The basic present of the speculation is that there are seven internal parts of an affiliation that ought to be balanced if it is to be viable. The framework can be used as a piece of a wide combination of conditions where a plan perspective is profitable, for example, to help improve the execution of an association, to examine the practical effects of future changes inside an association, to modify workplaces and systems in the midst of a merger or acquiring and to choose the best way to deal with realize a proposed strategy (Johnson, Whittington and Scholes 2011).

The speculation incorporates seven related elements which are orchestrated as either "hard" or "fragile" parts. "Hard" parts are less requesting to describe or recognize and organization can particularly affect them. They are system enunciations, affiliation diagrams and declaring lines, formal techniques and information advancement structures. "Sensitive" segments are all the more difficult to depict, not so much unmistakable yet rather more affected by culture. The seven related factors of the theory are the affiliations system, structure, systems, shared regards, style, staff and aptitudes. Shared regards are superordinate destinations which are basic issue to the headway of the different fundamental segments (Johnson et al 2011). The affiliation's structure, strategy, systems, style, staff and capacities all start from why the affiliation was at first made and what it stays for. The principal vision of an affiliation is encircled from the estimations of the creators and as the qualities change so does the different segments for proper game plan to each other.

The theory would be useful in the study to show the relationship between the independent and dependent variables. The shared values (independent variables) must be linked to all the dependent variables (reformation, training and capacity building, community-based policing and resource management). The APS strategy, structure, system, style, staff and skills are linked to all the strategic plans implementation processes in the service. However, change in any independent variable must be accompanied by similar change in strategy, structure, system, style, staff and skills which are all linked to dependent variables of the study

2.1.4 Institutional Theory

Institutions are social structures that have accomplished a high level of flexibility. They are made out of social subjective, regularizing and regulative components that together with related exercises and assets give dependability and importance to social life. Institutional hypothesis concentrates on the natural components experienced by an association, for example, outside or societal standards, tenets, and prerequisites that associations must fit in with so as to get authenticity and support (Scott 2004). The hypothesis depends intensely on the social builds to help characterize the structure and procedures of an association. It hypothesizes that society as entire assumes an imperative part in deciding the authenticity of an association and has substantially more power in the operations of an association.

The procedure of systematization depends vigorously on the association setup that comprises of the structures, procedures, connections and limits through which the association works (Johnson and Scholes, 2003).It states that the institutional condition can firmly impact the advancement of formal structures in an association more significantly than showcase weights. The hypothesis overcomes any issues between societal perspectives and association's activities. Administration is more mindful of social perspectives and suppositions and additionally ready to fuse societal standards and desires, tenets, controls and prerequisites in day by day operations of an association. The principles essential for the development of framework of institutional theory are social construction of institutional environment, viewing of organizations as open systems and conformity to rational myths.

This theory was useful in the study for it showed the management and public view of APS. The service would achieve considerable reforms and modernization if it implements its strategies accordingly. However, this is by full conformity to external factors such as societal norms, rules and requirements which gives legitimacy and support (Scott 2004).

2.2 Empirical Review

Rouse and Daellebach (2009) contended that for a firm to propel its execution, it must grasp and determine its primary assets that will enhance its intensity and maintainability. As per Barney (2011), an association's execution predominance isn't from one source yet from a bundle of assets both substantial and elusive. David (2003) noted that associations have no less than four sorts of assets that can be utilized to accomplish the coveted destinations; monetary, physical, human and innovative assets. Assets as a rule incorporate the accompanying key builds: assets, abilities and skills (Barney and Hesterly, 2010). Deliberately, assets are supplies of available things that are controlled by an association. Abilities include idle skills or aptitude utilized in association operations underlined with collected know-how (Day, 1994). Competencies are the association's qualities that empower it to better separate its items or administration quality by building innovative framework to react to clients' needs, henceforth enabling the firm to contend more effectively and effectively than different firms (Anderson, 2011).

The numerous actions important to execute a specific technique ought to be characterized regarding each sort of asset required. According to Johnson *et al*. (2003) some of the hindrances to strategy implementation include: availability of resources, leadership style, organization culture, corporate structure, lack of focus and failure by implementing team. Human, physical and financial resources play vital roles in the success or failure of implementing strategies in an organization (Musyoka, 2011). Nyogesa (2013), identified resources as a key component in implementation of strategic plans in NPS and proposed that the service should lobby for more resources and properly manage them with high levels of transparency and accountability.

Technological resources have proved to be of great importance in implementation of strategies if properly managed (Kipkurui, 2014). Introduction and update of ICT infrastructure in an institution has proved to be helpful in achieving the set goals and objectives. Moreover, with rapid advances in ICT, information has proved to be a key resource in an organization. The capacity to access and process data can construct or crush an association's center abilities that are critical for upper hand (Johnson & Scholes, 2002).

Human resources include all employees in an organization, their skills, qualifications and competencies. For effectiveness in administration of human resources there is need for regular staffing, training, enhancement and evaluation. Kipkurui (2014), while examining challenges facing implementation of strategic plans in NPS noted that though the service was over stretched there was inappropriate deployment where a good number of police officers were undertaking functions which were supposed to be carried out by other people. Resources are of great importance in helping an institution meet its set goals and objectives if well utilized.

2.3 Conceptual Framework

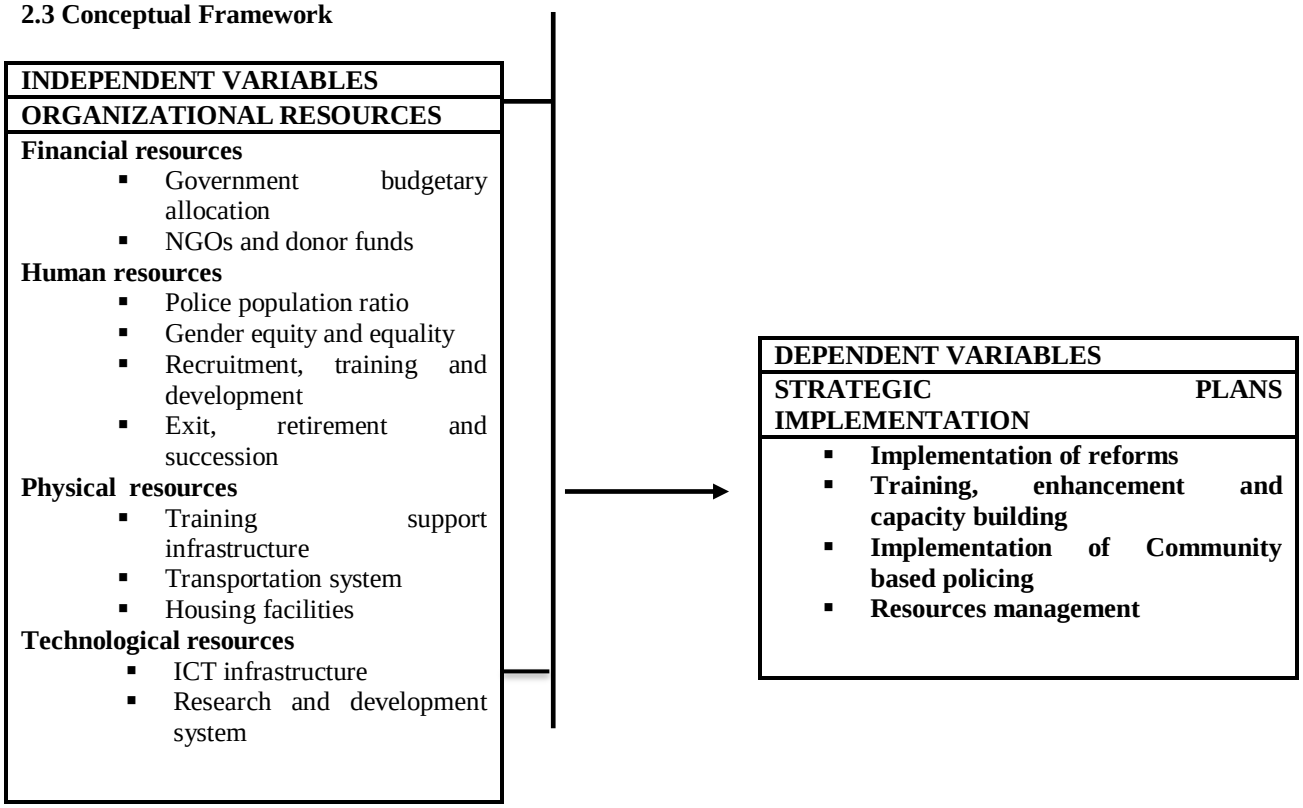

Figure 2.1 Conceptual framework

3.0 RESEARCH METHODOLOGY

The study adopted descriptive research design. The population of this study was Administration police officers deployed in Baringo County. The total number of officers was 720 found in six sub counties of Baringo county; Baringo Central 92, Baringo North 113, Mogotio 81, Marigat 223, Koibatek 128 and East Pokot 83. The aggregate sample size was 216 as shown in table 1 below. This study used both primary and secondary data. Data was collected by use of structured questionnaires adopting Likert scale formation. Data was analyzed mainly by use of descriptive and inferential statistics. Descriptive statistics included mode, mean, median, standard deviation. Inferential statistical techniques like correlation and regression coefficients were used to draw causal relationship between the various organizational resources and implementation of strategic plans. Data was presented by use of graphs, pie charts and tables. A pilot study was conducted in order to establish the validity and reliability of data collection instruments. This study used both construct validity and content validity. Statistical Package for Social Sciences (SPSS) computer software was used to produce both descriptive and inferential statistics. A multiple linear regression model was used to test the significance of the influence of the independent variables on the dependent variables.

Table 3.1: Research Size Sampling

S/No	Sub County	Population	Sample Size (30% of Population)	Percentage (%)
1.	Baringo Central	92	28	12.96
2.	Baringo North	113	34	15.74
3.	Mogotio	81	24	11.11
4.	Marigat	223	67	31.02
5.	Koibatek	128	38	17.59
6.	East Pokot	83	25	11.58
	Total	**720**	**216**	**100**

4.0 RESULTS AND DISCUSSIONS

4.1 Response Rate

The sample size of the study was 216 and generated a successful response rate of 74% as indicated in Table 4.1

Table 4.1: Response Rate

Variable	Frequency	Percentage (%)
Response	161	74
Non- Response	55	26
Total	**216**	**100**

4.2 Bio-Data Analysis

4.2.1 Gender Composition of Respondents

The study sought to establish the gender spread of respondents.

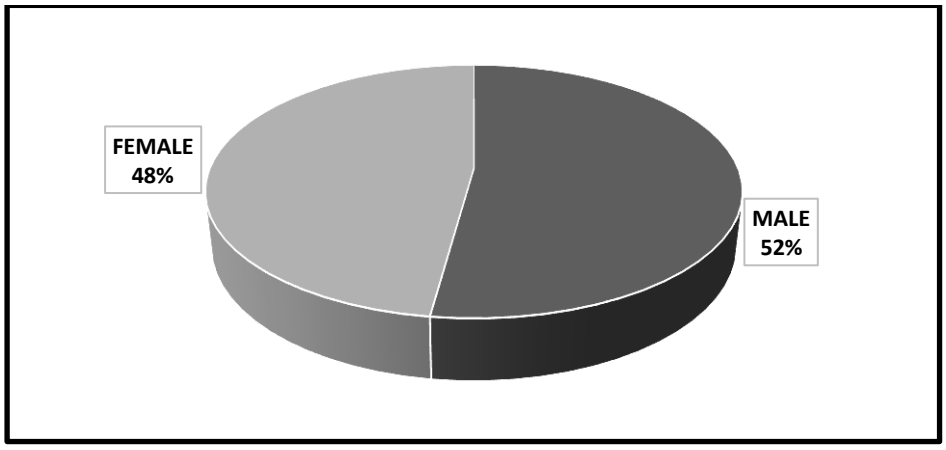

Figure 4.2.1: Gender

Figure 4.2.1 indicates that majority of the respondents 52% were male and 48% were female. This indicates that APS in Baringo County was not biased in recruiting and deploying officers in the county since it observed gender equity.

4.2.2 Length of Service

The researcher requested the respondents to indicate overall length of service in APS in Baringo County. The findings are indicated in Figure 4.2.2

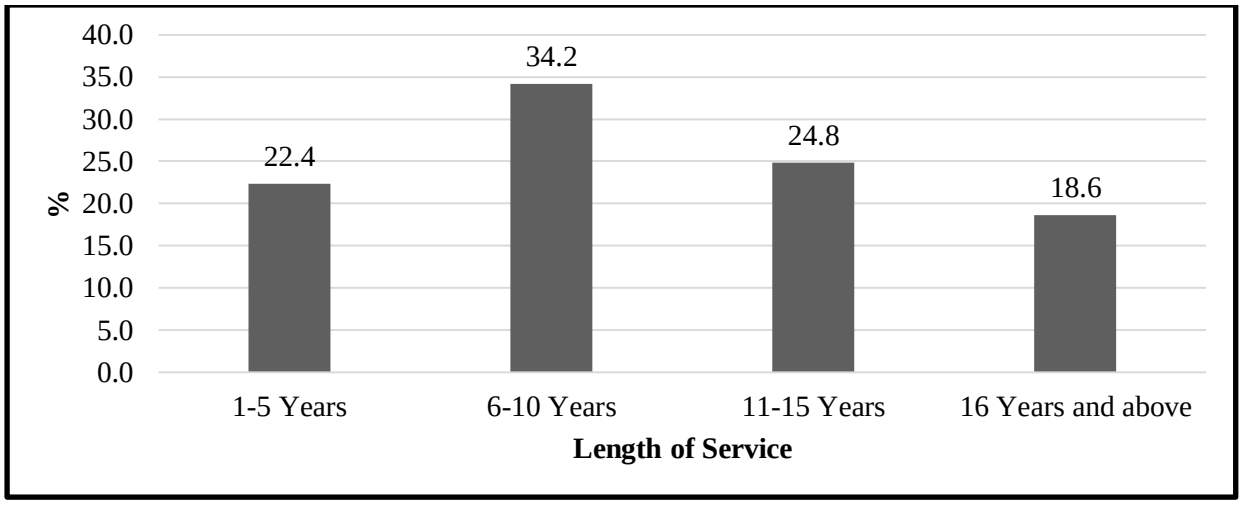

Figure 4.2.2: Length of Service
Figure 4.2.2 shows that 34.2% of the respondents' length of service was 6-10 years. 24.8% had worked for 11-15 years, 22.4% had served for 1-5 years and 18.6% had served for 16 years and above. This indicates that majority of the respondents' length of service was above six years. This shows that the respondents had clear information about their station hence reliable data was sought.

4.2.3 Current Station

The researcher requested the respondents to indicate their current station posted. The findings are indicated in the Figure 4.2.3.

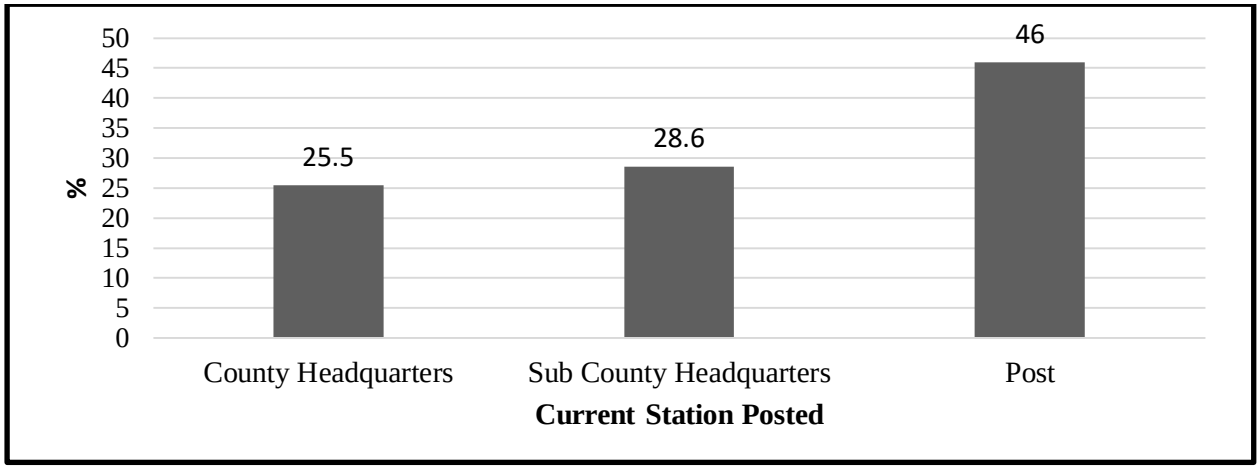

Figure 4.2.3: Current Station
Figure 4.2.3 point out that 46% of the respondents were currently deployed to police posts, 28.6% to Sub County headquarters and 25.5% to County Headquarters. This deduces that all the respondents were skilled on their line of duty and would give reliable data.

4.3 Descriptive findings

4.3.1 Financial Resources and Strategic Plans Implementation
Respondents were requested to indicate the extent of their agreements on the following statements. A Likert scale of 1-5 where; 1= Strongly agree, 2 = Agree, 3 = Neutral, 4 = Disagree and 5 = Strongly disagree was used. From the response, descriptive measure of dispersions was used for ease of interpretation. The findings are indicated in the Table 4.3.1

Table 4.3.1: Financial Resources

	Mean	Std. Dev
The government budgetary allocation to AP service in the county is sufficient	3.32	0.820
The county government funds APS in service delivery to the public	3.05	1.410
Community Development Fund (CDF) has supported construction of most AP housing facilities in the county	2.91	0.634
Most operations conducted by AP service in the county have been adequately funded by the government	3.89	1.250
All the funds allocated to the service in the county have been well utilized	3.41	1.210
NGOs and donors fund APS in the county	4.17	1.090

From Table 4.3.1, respondents agreed by a mean of 3.32 with standard deviation of 0.820 that the government budgetary allocation to AP service in the country was sufficient. County government funds APS in service delivery to the public as supported by a mean of 3.05 with standard deviation of 1.410. Respondents were in disagreement that community Development Fund supported construction of most AP housing facilities in the county as indicated by a mean of 2.91 with standard deviation of 0.634. In summary, government funding significantly influenced strategy implementation if well utilized by the administrators. This is in agreement with David (2003) who states that vital resources such as financial, physical, human and technological resources when well utilized can lead to successful implementation of organizational strategic plans. On the contrary, Kipkirui (2014), identified inadequate funding as a major challenge towards implementation of strategies in National police service and recommended the National government and donors to increase their budget allocation towards the service.

The study established a strong agreement that NGOs and donors fund APS in the county as indicated by a mean of 4.17 with standard deviation of 1.090. All the funds allocated to the service in the county were well utilized as shown by a mean of 3.41 with standard deviation of 1.210. Most operations conducted by AP service in the county were adequately funded by the government as supported by a mean of 3.89 with standard deviation of 1.250. In summary, APS receives funding majorly from the government and donors. The funds received were well utilized and the administrators are accountable. Lee *et al.,* (2001) states that an organization penchant towards achievement exchanges relies upon the accessibility of money related assets and an association might be shortened towards advancing procedures when monetary assets are restricted. Similarly, Musyoka (2011) highlighted that inadequate funding was a major hindrance that needed greater attention for strategy implementation.

4.3.2 Human Resources and Strategic Plans Implementation

Respondents were requested to indicate the extent of their agreement on following statements on a scale of 1-5 where; 1= Strongly agree, 2 = Agree, 3 = Neutral, 4 = Disagree and 5 = Strongly disagree. The findings are indicated in the Table 4.3.2

Table 4.3.2: Human Resources

	Mean	**Std. Dev**
There are enough officers in my work station to carry out APS mandate in the area	2.31	0.661
All the officers deployed in the station are competent and serviceable	4.07	0.962
Training, development and promotional courses have been offered to selected officers in the county	3.93	0.508
Job relationship between the station commander and the junior officers is good	4.37	0.892
Gender equity has been observed in recruiting and deploying officers in the county	3.23	0.920
Welfare of officers is adequately addressed by the management.	3.34	1.170

The findings as presented in Table 4.3.2 indicates that the respondents were in a strong agreement that job relationship between the station commanders and the junior officers was good as indicated by a mean of 4.37 with a standard deviation of 0.892. All the officers deployed in the station were competent and serviceable as supported by a mean of 4.07 with a standard deviation 0.962. Training, development and promotional courses were offered to selected officers in the county as shown by a mean of 3.93 with standard deviation of 0.508. This indicates that all the officers deployed in the stations were competent hence creating a good working environment. This is in agreement with Kipkurui (2014) who indicated that institutions have different processes of recruiting, training and developing its staff. Nyongesa (2013), further noted committed staff teamwork, partnerships and motivation of staff as some of the factors influencing strategy implementation in KPS.

Majority of the respondents were in agreement that the welfare of officers was adequately addressed by the management as indicated by a mean of 3.34 with standard deviation of 1.170. Gender equity was observed in recruiting and deploying officers in the county as shown by a mean of 3.23 with standard deviation of 0.920. The study further indicated an agreement that there were enough officers in police stations to carry out AP service mandate in the area as indicated by a mean of 2.31 with standard deviation of 0.661. This shows that the police officers administrators were gender sensitive and deployed enough officers to the stations. This is in agreement with Kipkurui (2014) who recommended deployment of police officers considering equality and gender.

4.3.3 Physical (Capital) Resources and Strategic Plans Implementation

The respondents were required to respond to the following statements on a scale ranging between 1 and 5 where; 1= Strongly agree, 2 = Agree, 3 = Neutral, 4 = Disagree and 5 = Strongly disagree.

Table 4.3.3: Physical (Capital) Resources

	Mean	Std. Dev
There is an office with a customer care desk in my station	4.08	0.595
Housing facilities are enough for all officers deployed in the station	2.37	0.932
All housing facilities are in good condition and operational	3.15	1.370
The police equipment in the station are enough and in good condition	3.66	1.120
There is government vehicle(s) allocated to the station to provide transport to officers while on official duties	3.69	1.060
My station is connected to electricity national grid	3.71	1.260

Majority of the respondents were in agreement that there was an office with a customer care desk at their stations as supported by a mean of 4.08 with standard deviation of 0.595. Stations were connected to electricity national grid as indicated by a mean of 3.71 with standard deviation of 1.260. There was government vehicle(s) allocated to the stations to provide transport to officers while on official duties as supported by a mean of 3.69 with standard deviation of 1.060. In summary, this indicates that the police posts had proper infrastructure. This is in agreement with Musyoka (2011), who found out that inadequate physical resources were major hindrance in the organization that needed greater management attention. Therefore, infrastructure was the major physical resources required by an organization.

Respondents were in agreement that police equipment in their stations were enough and in good condition as indicated by a mean of 3.66 with standard deviation of 1.120. All the housing facilities were in good condition and operational as shown by a mean of 3.15 with standard deviation of 1.370. Housing facilities were enough for all officers deployed in the stations as indicated by a mean of 2.37 with standard deviation of 0.932. However, Greco, Cricelli & Grimaldi (2013) noted that physical resources alone are insufficient to achieve the desired results hence they should be combined with other organizational resources.

4.3.4 Technological Resources and Strategic Plans Implementation

Respondents were requested to indicate their level of agreement on the following statements on a scale of 1 to 5 where; 1= Strongly agree, 2 = Agree, 3 = Neutral, 4 = Disagree and 5 = Strongly disagree. The findings are indicated in Table 4.3.4

Table 4.3.4: Technological Resources

	Mean	Std. Dev
My station is well equipped with ICT facilities (Computer, Printer, Photocopier, Scanner, Modem etc.)	4.27	0.941
ICT courses have been offered to nominated officers serving in the county	3.28	0.572
The station has qualified officers to handle and operate ICT facilities	3.59	1.120
There are modern police equipment allocated to the station by the government	4.23	1.000
My area of deployment is fully connected to network providers (Safaricom, Airtel, Orange etc.)	2.93	0.926
There is an urgent need for the government to capitalize on technological resources in the county	4.11	0.852

Majority of the respondents were in agreement to a great extent that their stations were well equipped with ICT facilities by a mean of 4.27 with standard deviation of 0.941. Stations had qualified officers to handle and operate ICT facilities as shown by a mean of 3.59 with standard deviation of 1.120. ICT courses were offered to nominated officers serving in the county as indicated by a mean of 3.28 with standard deviation of 0.572. In summary, majority of the police stations had adopted technology in their line of duty. This is in agreement with Kipkurui (2014), who

indicated that advanced use of inappropriate technology in policing was a major factor failing implementation of strategies in NPS due to increased developments which are major tools enhancing technology in the institution.

There was an urgent need for the government to capitalize on technological resources in the county as indicated by a mean of 4.11 with standard deviation of 0.852. There were modern police equipment's allocated to the stations by the government as supported by a mean of 4.23 with standard deviation of 1.000. This is similar to a study by Nyogesa (2013) who suggested improvement of technology in the service by acquiring modern communication gadgets, riffles, bullet proof vehicles and vests.

Respondents were in disagreement that their area of deployment was fully connected to network providers as shown by a mean of 2.93 with standard deviation of 0.926. Network connection would lead to increased communication and proficiency of the police department. This is in agreement with Arend and Levesque (2010) who indicates that organizational competency is an association's quality that empowers administration quality by building innovative framework to react to clients' needs, consequently enabling it to contend more proficiently and effectively than others.

4.5 Inferential Statistics

4.5.1 Correlation Analysis

The correlation analysis findings are indicated in table 4.5.1.

Table 4.5.1: Correlation Analysis

		Implementation	**Financial resources**	**Human Resources**	**Capital Resources**	**Technological Resources**
Implementation	Pearson Correlation	1				
	Sig. (2-Tailed)					
	N	161				
Financial Resources	Pearson Correlation	0.419**	1			
	Sig. (2-Tailed)	0.000				
	N	161	161			
Human Resources	Pearson Correlation	0.468**	0.529**	1		
	Sig. (2-Tailed)	0.000	0.000			
	N	161	161	161		
Capital Resources	Pearson Correlation	0.788**	0.337**	0.448**	1	
	Sig. (2-Tailed)	0.000	0.000	0.000		
	N	161	161	161	161	
Technological Resources	Pearson Correlation	0.878**	0.387**	0.375**	0.767**	1

	Sig. (2-Tailed)	0.000	0.000	0.000	0.000	
	N	161	161	161	161	161

Table 4.5.1 shows the findings of correlation analysis. Huber (2004) held that in the interpretation of results for the linear relationships in a study, for a weak correlation, "r" ranges from ± 0.10 to± 0.29; in a moderate correlation, "r" ranges between ±0.30 and ±0.49; while in a strong correlation, "r" ranges from ±0.5 and ± 0.9.

Financial resources had a Pearson correlation of 0.419 with a p value of 0.00. This indicates that the financial resources had a moderate correlation with strategic plan implementation. The p value was 0.00<0.05 indicating that the variable significantly influenced the study. For successful implementation of strategic plans proper utilization of financial resources with other organizational resources is useful (David 2003)

Human resources had a Pearson correlation of 0.468 an indication of moderate correlation with implementation of strategic plans. The p value was 0.00<0.05 indicating that the variable also significantly influenced the study. For full realization and implementation of strategic plans, involvement of human resources is mandatory (David, 2003)

Capital resources had a Pearson correlation of 0.788 indicating a strong positive correlation between the variables. The p value was 0.00<0.05 indicating that the variable also significantly influenced implementation of strategic plans. However, according to David (2003) capital resources alone cannot be utilized to achieve full implementation of strategic plans

Technological resources had a Pearson correlation of 0.878 an indication of strong correlation and the p value was 0.00<0.05 indicating that the variable significantly influenced the study. From the findings, technological resources had the strongest correlation with strategic plans implementation followed by; capital resources, human resources and financial resources consecutively. The p value of all the variables was 0.00<0.05 indicating that the study variables significantly influenced implementation of strategic plans.

4.5.2 Regression Analysis

Model Summary

The findings of coefficient of correlation and coefficient of determination was identified by the researcher as indicated in the Table 4.5.3

Table 4.5.3: Model Summary

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	0.903[a]	0.815	0.809	1.75266

a. Predictors: (constant), financial resources, human resources, technological resources and capital resources

Coefficient of correlation R was 0.903 an indication of strong positive correlation between variables. Coefficient of determination R^2 was 0.815 which translates to 81.5%. This indicates that variations of dependent variables were explained by independent variables.

Analysis of variance (ANOVA)

An ANOVA was carried out at 5% level of significance. A comparison between $F_{Calculated}$ and $F_{Critical}$ was carried out. The findings are indicated in Table 4.5.4

Table 4.5.4: ANOVA

Model	Sum of Squares	df	Mean Square	F	Sig.
Regression	2101.768	5	420.354	136.842	0.000[b]
Residual	476.132	155	3.072		
Total	**2577.901**	**160**			

a. Dependent Variable: Implementation of strategic plan

b. Predictors: (Constant), financial resources, human resources, technological resources and capital resources

$F_{Calculated}$ was 136.842 and $F_{Critical}$ was 2.2725. $F_{Calculated} > F_{Critical}$ an indication that the overall regression model significantly influenced the study. The p value was 0.00<0.05 indicating that the study variables significantly influenced implementation of planned strategies in Administration police service in Baringo County.

Coefficients

The following coefficients were generated the study.

Table 4.5.5: Coefficients

	Unstandardized Coefficients		**Standardized Coefficients**		
Model	**B**	**Std. Error**	**Beta**	**T**	**Sig.**
(Constant)	5.657	1.537		3.681	0.000
Financial Resources	0.258	0.067	0.037	3.851	0.000
Human Resources	0.130	0.056	0.100	2.308	0.022
Capital Resources	0.217	0.062	0.231	3.504	0.001
Technological Resources	0.735	0.063	0.646	11.725	0.000

a. Dependent Variable: Implementation of strategic plans

From the findings in Table 4.5.5, if all the factors (financial, human, technological and capital resources) were held constant, strategic plan implementation would be at 5.657. A unit increase in financial resources when all the other factors were held constant, strategic plan implementation would be at 0.258. A unit increase in human resource when all the other factors are held constant, strategic plan implementation would be at 0.130. A unit increase in capital resources would lead to an increase of strategic plan implementation by 0.217. A unit increase in technological resources when all other factors are held constant would lead to an increase in strategic plan implementation by 0.735.

The p value of financial resources was 0.00<0.05 an indication that financial resources significantly influenced strategic plan implementation. This is similar to a study carried out by Lee *et al.,* (2001) who indicated that organization penchant towards achievement exchanges relies upon the accessibility of money related assets and an association might be shortened towards advancing procedures when monetary assets are restricted. Similarly, Inmyxai and Takahashi (2010) stated that financial resources suggest the association's capacity to proficiently use its money related asset to expand benefits such as strategic plan implementation.

The probability value of human resources was 0.022<0.05 an indication that the variable significantly influenced strategic plan implementation. This is in agreement with Huselid, Jackson and Schuler (1997) who indicated that coordinating human asset administration with procedure, the basic HR aptitudes, demeanors, practices and exhibitions that are expected to effectively actualize methodologies can be obtained, created, spurred and kept up. The p value of capital resources was 0.01<0.05 indicating that the study variable significantly influenced strategic plan implementation

The p value of technological resources was 0.00<0.05 indicating that the variable significantly influenced strategic plan implementation. Technology is an important resource in influencing companies' performance (Njoroge, Muathe & Bula, 2016). Barney and Hesterly (2010) propelled that elusive innovation assets are more maintainable than substantial assets which can be gained and copied by contenders.

5.0 DISCUSSION, CONCLUSIONS AND RECOMMENDATIONS

5.1 FINDINGS

The study found out that financial resources positively influenced implementation of strategic plan in the Administration Police service in Baringo County. Majority of the operations conducted by the AP service were funded by the government. The funds allocated to the service in the county were well utilized. The county government funded APS in service delivery and Community Development Fund supported construction of most AP housing facilities in the county.

Human resources significantly influenced implementation of strategic plans in Baringo County. There was a good job relationship between the station commanders and junior officers. Majority of the officers deployed in the stations were competent and serviceable to the community. Training, development and promotional courses were offered to selected officers in the county for increased competence level. The welfare of officers was adequately addressed by the management. Gender equity was observed in recruiting and deploying officers.

Capital resources positively influenced the strategic plans implementation in Baringo County. Respondents were in agreement to a great extent that there was an office with a customer care desk in their stations of deployment. Majority of the stations are connected to electricity national grid. The government had allocated vehicle(s) in Baringo county AP stations to provide transport to officers while on official duties. The police equipment in the stations were enough and in good condition. Majority of the housing facilities were in good condition and operational. Housing facilities were not enough for all officers deployed in the station.

The study also established that technological resources significantly influenced strategic plan implementation in APS in Baringo County. Stations are well equipped with ICT facilities. Modern police equipment's were allocated to the stations by the government. The government is required to capitalize on technological resources in the county. The stations had qualified officers to handle and operate ICT facilities.

5.2 Conclusions

The study concludes that financial resources, human resources, physical (capital) and technological resources positively influenced strategic plan implementation in Baringo County. The resources are vital in achievement of an organization goals and objectives. However, the resources must be well utilized.

5.3 Recommendations

The study recommends that both national and county governments should increase their funding to APS in Baringo County for increased operations and efficiency in execution of its duties to the community. Community Development Fund should be utilized to support construction of AP housing facilities in the county.

Good job relationship between the station commanders and the junior officers should be maintained. Training, development and promotional courses should be offered to selected officers in the county for increased competency level. The welfare of officers should be adequately addressed by the management. There should be improvement on observing gender equity and equality while recruiting and deploying officers in the county to reduce gender discrimination. Deployment of officers in Baringo County to be increased for efficiency in service delivery.

The study also recommends all police stations to be connected to electricity national grid. The government should consider allocating more vehicles in Baringo county AP stations to ease transportation of officers while on official duties. The police equipment in the stations should be enough and in good condition. The government should ensure that all housing facilities are in good condition, operational and enough for all officers deployed in the county.

The study further recommends clear guidelines to be made on implementation of reforms and community-based policing and management of available AP resources in the county. Administration police service should improve its guidelines on training, enhancement and capacity building of its personnel.

5.4 Suggestions for Further Studies

The current study mainly relied on primary data, future studies should carry out both primary and secondary data for precise results. Coefficient of determination R^2 was 0.815 which translates to 81.5%. The residual of 18.5% was explained by other factors beyond the scope of the current study that future scholars should focus on. The study was carried out in Administration police service in Baringo County, future studies should be carried out in different counties in Kenya.

***How to cite this article*: Muthoni, J.M. (2019). Transformational Leadership and Growth of Women-Owned Micro and Small Enterprises in Kasarani Division, Nairobi County - Kenya, *Journal of Human Resource and Leadership,* 3(1), 1-22.**

Abstract

The growth of women-owned enterprises is currently attracting much policy and literal attention. There is debate that transformational leadership is essential to the growth of micro and small enterprises (MSEs). However, empirical evidence of the role of transformational leadership on the growth of women-owned enterprises in Kenya is scarce. The purpose of this study was to examine the effects of transformational leadership on the growth of women-owned enterprises in Kasarani Division in Nairobi County. A random sample of 400 women-owned and managed MSEs was surveyed using a structured questionnaire. The Multifactor Leadership Questionnaire (MLQ) was used to measure transformational leadership. Regression models were used to examine the effects of transformational leadership on enterprise growth. Having parents in business and obtaining business advice were negatively associated with growth. Further, the age of the business and obtaining credit for business operations were positively associated with enterprise growth. The results of this study suggest that enhancing transformational leadership in women-owned enterprises is a viable policy option. The need to enhance business heritage is recommended.

Key Words: *Transformational Leadership, Growth, Women-owned SMEs,*

1.0 Introduction

1.1 Background to the Study

Growth is a multidimensional concept which includes economic and financial measures such as sales growth, profits, owner income, and number of employees. This can be referred to as objective measures (Lerner & Almor, 2002). Another way of looking at growth is by use of subjective measures which include non-financial goals and global success ratings made by women entrepreneurs (Helgesen, Nesset & Voldsund, 2008). Any of the above measures can be used to describe growth of an enterprise, hence the term multidimensional. According to a survey report by Central Bureau of Statistics, International Center for Economic Growth and K-REP Holdings (1999) change in the number of employees over time is considered a useful indicator of growth for MSEs. There is evidence that women

usually view growth of their enterprises using subjective measures (Machado, St-Cyr & Mione, 2003). Studies in Kenya have mainly focused on objective measures of growth (Gakure, 2003; Kibas, 2006) while neglecting subjective measures. Understanding the nature of growth in women-owned enterprises using subjective measures may reveal patterns of growth that are currently not known, hence the need for further research.

Existing data shows that women-owned enterprises in the country suffer from high mortality rates, operate informally thus incur the penalties of informality and rarely grow or graduate to high value-adding activities (Government of Kenya [GoK], 2005). According to McCormick (2001), women-owned enterprises that started small tend to remain small and very little transformation occurs among them. Eagly *et al*., (2003) demonstrates that firms set up and run by women tend to display distinctive features which influence their growth. For instance, during the phase of growth, women in business display distinct abilities in transformational leadership (Brush, 1992). It is however not clear whether transformational leadership influences growth of women-owned MSEs in Kenya.

Transformational leadership involves the leader's ability to make group members become less interested in themselves and more interested in the group (Rosener, 1990). Moore and Buttner (1997) observe that transformational leaders tend to encourage the participation of all employees at different levels of decisions, share power and information with them, stimulate and motivate them. Brush (1992) argues that women's attitude towards power tends to be relational consensual with little emphasis on authority and communication. Other characteristics mentioned are true concern over quality of services provided and an emphasis on social objectives (Machado, St-Cyr & Mione, 2003). This leadership style raises employee satisfaction and results in higher performance levels (Chaganti, 1986).

According to Bird (1989), women-owned enterprises do not grow at a rate that would realize economic benefits to the entrepreneur. It is, therefore, important to study and document what can spur the growth of women-owned enterprises in Kenya. Transformational leadership has been documented as a correlate of growth of women-owned enterprises in the developed world (Rosener, 1990) however similar data is not available in Kenya. This makes it difficult to develop appropriate policy options that could be used to enhance the performance of women-owned enterprises. Examining the effects of transformational leadership on the growth of women-owned enterprises is, therefore, necessary.

The Concept of Entrepreneurship

Entrepreneurship can be conceptualized as the discovery of opportunities and the subsequent creation of new economic activity often via the creation of a new organization (Venkataraman, 1997). Entrepreneurship is often discussed under the title of the entrepreneurial factor, the entrepreneurial function, entrepreneurial initiative and the entrepreneurial behavior.

The entrepreneurial factor is understood to be a new factor in production that is different to the classic ideas of hard labour and capital which must be explained via remuneration through income for the entrepreneur along with the shortage of people with entrepreneurial capabilities. Its consideration as an entrepreneurial function refers to the discovery and exploitation of opportunities or to the creation of an enterprise. Entrepreneurial behavior is seen as behavior that manages to combine innovation, risk-taking and pro-activeness (Miller, 1983). In other words, it combines the classic theories of the innovative entrepreneur (Schumpeter, 1934), the risk-taking entrepreneur that occupies a position of uncertainty as proposed by Knight (1921) and the entrepreneur with initiative and imagination who creates new opportunities. Entrepreneurial initiative covers the concept of creation, risk-taking, renewal or innovation inside or outside an existing organization.

Entrepreneurship could be said to be a process by which individuals, either on their own or within organizations pursue opportunities (Stevenson & Jarillo, 1990; Busenitz *et al.*, 2003). It has recently been claimed that if managers and businessmen of many firms were to adopt entrepreneurial behavior when developing strategies, firms would be facing a much brighter future than current perceptions suggest (Lee & Peterson, 2000).

The entrepreneur's central activity is that of business creation, which can be studied at an individual and/or at group level, analyzing psychological aspects and social variables of education, background on the family either at an environmental level using variables that enable business development, or by analyzing aspects of the economic,

social and cultural environments (Bird, 1989). The study of entrepreneurs as individuals analyses the variables that explain their appearance, such as personal characteristics, the psychological profile (the need to achieve, the capacity to control, tolerance and ambiguity and a tendency to take risks) or non-psychological variables (education, experience, networks and the family).

Women-Owned Enterprises

Some extant literature, however, suggests that women's past experience and backgrounds may shape their subsequent behaviours (Fischer, Reuber & Dyke, 1993; Beasley, 1999). For instance, Bruni, Gherardi & Poggio (2004) suggest that due to the constraints women face in a male dominated environment, women are likely to develop an ability to feel and anticipate the reactions of others. The concern for relational aspects and flexibility that women portray in business has roots in the variations in power and opportunity accorded to men and women in society. Elsewhere, Beasley (1999) argues that differences between men and women exist from their early stages of growth in life and result in fundamentally different ways of viewing the world. That is, men and women are inherently different because of differences in their socialization, training and experiences encountered prior to entry into particular work positions. Therefore differences emerge in nurturing results in different self-perceptions, motivations and belief structures between men and women. Consequently, women adopt different approaches to work (Fischer, Reuber & Dyke, 1993). Therefore, the unique experiences and backgrounds of women may explain the subsequent behavior in enterprise. Studies that have attempted to investigate the relationship between such antecedents, transformational leadership, and growth of women owned enterprises are not readily available.

This dearth of literature could largely be attributed to lack of appropriate frameworks. Existing literature highlights a universalistic model when investigating the relationship between transformational leadership (Reuber & Fischer, 1999) and the growth of women-owned enterprises.

The participation of women in business and especially, in the Micro and Small Enterprises (MSEs) sector has increased tremendously since the 1980s (Stevenson & St-Onge, 2005). MSEs are broadly defined as income generating enterprises that employ less than 50 persons (GoK, 2005) and have now become the main source of income and employment for the majority of women in the Kenya. By 1999, there were 612,848 women-owned MSEs in Kenya, making 47.7 percent of the total ownership of the MSEs in the country (Central Bureau of Statistics, International Center for Economic Growth and K-REP Holdings Ltd., 1999). The patterns of growth and factors involved in these enterprises is however not clear.

The performance of women-owned enterprises in Kenya is modest. Data shows that the average number of employees in women-owned MSEs in Kenya is 1.54 (Stevenson & St-Onge, 2005; Central Bureau of Statistics, International Center for Economic Growth and K-REP Holdings Ltd., 1999). These reports also indicate that in total, women-owned enterprises account for 40 percent of the employment in the MSE sector. About 86 percent of the workers in women-owned MSEs are owner managers, 4 percent are employees and the remainder is made up of either family members or apprentices. Women-owned enterprises also report on average, lesser income than that reported by their male counter-parts. For example, in the 1999 National Baseline Survey (Central Bureau of Statistics, International Center for Economic Growth and K-REP Holdings Ltd., 1999), women enterprises reported 57 percent of the income reported by male-owned enterprises. The performance of women-owned enterprises must therefore be improved if they are to effectively respond to the challenges of creating employment and wealth, alleviating poverty and redistributing wealth. Enhancing the performance of women-owned enterprises requires a clear understanding of growth and the factors involved.

Some factors identified include: gender inequalities in the distribution of income, limited access to and control of productive resources such as land and credit, and the multiple roles of women. While the identification of such factors is an important exercise, it appears that issues that affect women in general appear to be mentioned without regard to their relative importance in determining the growth of women-owned enterprises. Thus validation of such factors among women-owned enterprises is necessary. Conducting studies on the growth of women-owned enterprises might also identify other factors that are not explicitly mentioned in this *Sessional paper*. Identifying these factors along with their relative importance is crucial for policy prioritization, given that different factors might be associated with particular policy measures.

After identifying the constraints to growth of women-owned enterprises, *Sessional Paper Number 2* of 2005 on Development of Micro and Small Enterprises for Wealth and Employment Creation for Poverty Reduction (GoK, 2005) outlines in detail four sets of strategic options that are aimed at addressing the gender issues in MSEs. These include ensuring that the MSE policy is gender responsive, establishing a gender mainstreaming framework, empowering women and ensuring that MSE support programmes and projects are designed in such a way that they offer equal opportunities to all.

Prerequisite for policy intervention is sound empirical information on issues where action is required. The findings of this paper therefore, stand to provide a concrete input in the design of effective and gender-responsive MSE policy in Kenya.

The growth of women-owned enterprises continues to attract a lot of scholarly attention. This attention which has largely been developed in the industrialized countries revolves around the definition of the term growth (Rauch *et al*., 2006) and an analysis of the factors involved especially transformational leadership (Eagly *et al*., 2003).

The Nature of Female Entrepreneurship

Since the 1980s, an emerging body of literature has attempted to examine the role of the woman in enterprise (Moore & Buttner, 1997). This body of knowledge is commonly known as female entrepreneurship. Female entrepreneurship may simply be defined as the identification and exploitation of opportunities for gain by females. If these opportunities have to be fully beneficial, women-related studies especially on the area of growth have to be researched on.

Literature on female entrepreneurship may be categorized into five thematic areas. These include sectoral distributions of women enterprises, patterns of female entrepreneurship, barriers to women entrepreneurship, motivations of women entrepreneurship and the managerial styles of women entrepreneurship (Bruni, Gherardi & Poggio, 2004). Most literal works report that a great majority of women entrepreneurs are not only concentrated in commerce and especially services but also began work in that area (McCormick, 2001). Patterns of female entrepreneurship (Stevenson & St-Onge 2005; Gakure, 2003) have also been examined in previous studies on female entrepreneurship.

1.2 Statement of the Problem

Women-owned enterprises in Kenya suffer from high mortality rates, operate informally thus, incur the penalties of informality, rarely grow or graduate to high value-adding activities and very little transformation occurs among them (GoK, 2005; McCormick, 2001). These shortcomings compromise the current government's efforts that are aimed at wealth and employment creation, poverty alleviation and redistribution of wealth and policy formulation to enhance growth of this important sector. However, data on the factors that influence growth of women-owned enterprises is scanty in Kenya. In the developed world transformational leadership has been associated with growth of women-owned enterprises (Bruni, Gherardi & Poggio, 2004; Eagly *et al*., 2003; Beasly, 1999; Fischer, Reuber & Dyke, 1993). This paper, therefore, sought to examine the effects of transformational leadership in women-owned enterprises in order to spur growth in Kasarani division of Nairobi County, Kenya.

1.3 Objective of the Study

To establish the relationship between transformational leadership and growth of women-owned MSEs Kasarani Division of Nairobi County.

1.4 Research Question

What is the relationship between transformational leadership and the growth of women-owned MSEs in Kenya?

1.5 Significance of the Study

This paper attempts to apply entrepreneurship concepts into the growth of women-owned enterprises and also seeks to represent enterprise growth from a woman's way of being, thinking and doing. This is quite unlike the common and restrictive gender dualism approach. In addition the paper attempts to document the contingent effects of transformational leadership on growth of women-owned enterprises. Thus it is expected that this paper would eventually deepen the understanding of growth in women- owned enterprises as be used by future researchers as a base for their work.

2.0 Literature Review

2.1 Theoretical Literature Review

2.1.1 The Liberal Feminist and Social Feminist Theories

Two theoretical orientations have emerged that seek to explain the origins of the behaviours of female owner-managers. These are the liberal feminist and social feminist theories. Fischer, Reuber & Dyke (1993) notes that the liberal feminist theory is rooted in liberal political philosophy which encompasses basic beliefs in the equality of all beings, and in human beings as essentially rational, self-interest-seeking agents. The liberal feminist theory attributes gender-based differences to the variations in power and opportunity accorded men and women in society. Thus, differences in the achievements of men and women are ascribed to the inability of women to realize their full potential because they are denied equal access to opportunities in the labour markets and to resources. This in turn has hindered women from acquiring the skills and capabilities necessary to compete on equal basis with men.

According to the liberal feminist theory, gender differences in performance cease to exist once equal access to resources is ensured (Carter, Williams & Reynolds, 1997). Bruni, Gherardi & Poggio (2004) suggest that due to the constraints women face in a male dominated environment, women have been forced to develop an ability to feel and anticipate the actions of others. Therefore the concern for relational aspects and the flexibility they have natured in so many supporting roles as well as their everyday coordination of family and work responsibilities is a valuable organizational exploitable resource. Consequently, it should be expected that women exploit relational aspects to grow their businesses.

In contrast, the social feminist theory, which emanates from the social learning theory and psychoanalysis, holds that differences between men and women exist from their earliest moments in life and result in fundamentally different ways of viewing the world (Beasley, 1999). These differences are seen in the way women and men construct and interpret reality and how these influence the formation of their values and intentions (Carter, Williams & Reynolds, 1997). Men and women are inherently different because of differences in their socialization, background training and experiences encountered prior to entry into particular work positions. The differences that emerge in nurturing result in different self-perceptions, motivations and belief structures. Consequently, women adopt different approaches to work which may or may not be as equally effective as those adopted by men (Fischer, Reuber & Dyke, 1993).

2.1.2 Israel Kirzner's Theory

Kirzner (1997) represents the Neo-Austrian approach to entrepreneurship and be focused on the question of whether a market economy works, and, if it does so, what is the process that leads the economy towards equilibrium. He claims that initially the economy is in disequilibrium and the competition among alert entrepreneurs leads to equilibrium. He advocates that profit opportunities stimulate entrepreneurship. He contends that the alertness in an entrepreneur is a peculiar form of knowledge that cannot be obtained through a rational investment policy. He states that entrepreneurs are profit-seeking speculators characterized by a kind of superior knowledge that enables them to gain from the ignorance of others (Kirzner, 1997).

Kirzner's entrepreneurship model holds the following: that the entrepreneur sub-consciously discovers an opportunity to earn money by buying resource or producing the resource and then sell it at a profit; that the entrepreneur finances the venture by borrowing money from a capitalist; that the entrepreneur uses the funds for his entrepreneurial venture; and that the entrepreneur pays back the capitalists, including interest, and retains the pure entrepreneurial profit. In conclusion, Kirzner's considers the entrepreneur's alertness to recognize opportunity more characteristic than innovation in defining entrepreneurship. The entrepreneur either remedies or corrects errors of the customers (Kirzner, 1997).

2.1.3 Frank Knight's Risk Bearing Theory

Frank Knight first introduced the dimension of risk-taking as a central characteristic of entrepreneurship (1921). This theory considers uncertainty as a factor of production and holds the main function of the entrepreneur as acting in anticipation of future events. The entrepreneur earns profits as a reward for taking such risks. According to Knight, it is not change that gives rise to profits, but uncertainty and the possibility of incorrectness of expectations. If uncertainty characterizes the environment, the problem is no more represented by the actual execution of activity; the

issue is deciding what to do and how to do it. This primary function is the entrepreneurial function; the endeavour of deciding how various objectives are to be achieved and of predicting which objectives are worth achieving competes to the entrepreneur, a specialist who is prepared to bear the cost of uncertainty (Knight, 1921). The exercise of entrepreneurship is usually associated with uncertainty bearing and has something to do with imperfect knowledge. Recent theories emphasize that the entrepreneur does not merely deal with the consequences of imperfect knowledge but rather concerns the regards of discovering and using new knowledge.

If Knight's work and subsequent developments identify in the capability of treating uncertainty, a crucial determinant of the entrepreneurial decision, according to alternative perspectives, mere differences in risk aversion cannot explain the special role of entrepreneurs because independent risks can be insured by means of capital markets. These approaches assign the entrepreneur the role of coping with the unknown, that is, to produce an effort to get things done but to deal with unforeseen events where risks can fail to be assured (Bird, 1989). It is out of the works of Knight that the general equilibrium theory of the firm under uncertainty was developed by Kihlstrom & Laffont (1979).

2.2 Empirical Literature Review

2.2.1 Transformational Leadership and Growth of Women Entrepreneurship

Interactive transformational leadership was the style employed by many of the women managers who were rising in the organizational ranks and moving into work roles traditionally occupied by men (Riebe, 2003). The entry of large numbers of women into workplace, the emergence of teams and the growing importance of successful team management had provided women with opportunities to showcase their leadership skills. But as a consequent of prevailing attitudes (Kossek, Market and McHugh 2003), including stereotyping in organizations (Ely, 1994), women often found themselves marginalized (Kanter, 1977) and denied access to power (Kanter, 1987). Highly visible but isolated (Sealy, 2010) they learnt from experience to employ an interactive style of transformational leadership because it could moderate the effects of gender biases (Lerner and Almor, 2002).

Rosener (1990) calls women entrepreneurs' models of a leadership style which she labeled as non-traditional or transformational. Such entrepreneurs build a relationship of mutual stimulation and as elevation that converts followers into leaders and may convert leaders into moral agents. This occurs when leaders and followers engaged with others in such a way that leaders and followers raise one another to higher levels of motivation and morality (Burns, 1978 in Bass 1997).

Rosener (1990) suggests that one of the distinctive and characteristic features of women in leadership positions is their ability to engage in interactive leadership relationships with their managers and employees and a determination to empower others. Women see leadership as an on-going process, envisioning themselves as team leaders, as inspirational rather than directive, as participative rather than hierarchical, working to co-ordinate and balance their interests and those of their employees and transforming these into shared goals.

2.3 Conceptual Framework

Independent Variables

Dependent Variable

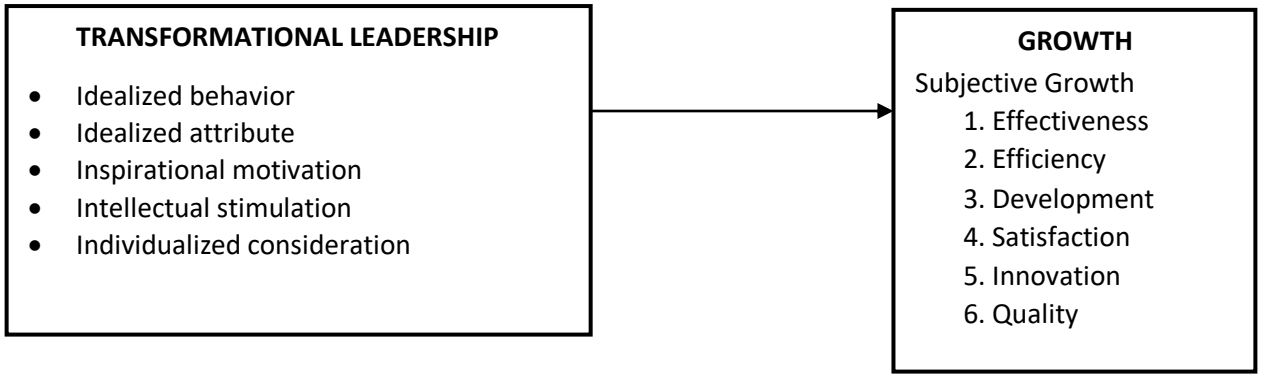

Figure 1.0: Conceptual Framework

3.0 Research Methodology

This was a cross-sectional survey of women owned enterprises. The rationale for this design was to seek to describe the current situation in regard to effects of transformational leadership and the growth of women-owned MSEs in Kasarani Division of Nairobi County. Surveys are useful in examining the relationship between phenomena and in policy derivation (Saunders *et al.,* 2003). Using the survey approach helped to obtain a holistic picture of growth dynamics in women-owned enterprises.

The target population of this study included all the women-owned MSEs in the study site that had between 2 and 50 employees. The population was heterogeneous since it comprised of MSEs operating in varied disciplines. These included salons and barber shops; green groceries; retail kiosks; food kiosks; hardware stalls; second hand clothes stalls; and cereals stalls. The MSEs are characterized by the following attributes: owner managers; less than 50 employees; premised in a mix of formal and informal shelters; location along major pathways within residential areas; and family-owned. The total population of this study included 1,759 women-owned enterprises. The list of women-owned MSEs in Kasarani Division of Nairobi was constructed from lists provided by Nairobi City Council (NCC) and City's Public Health office.

From the constructed sampling frame, simple random sampling procedures were used to select the study sample. The sample size formula (Black, 2005) was used to compute the sample size. This formula is applied for large sizes of population, especially where the actual size may not be know but estimates can be provided, just was the case in this study. The need to allow for the margin of error of 5 percent allows for the sample results to be generalized with utmost precision. This resulted to a sample size of 384 respondents.

$$n = \frac{Z^2 pqD}{d^2}$$

The study relied on primary data. Data from the MSEs was collected through administration of a structured questionnaire which contained structured questions covering issues of enterprise growth and transformational leadership. The questionnaires were administered through drop-and-pick method and a pilot study was conducted with 40 women-owned enterprises in the study area before the final survey. These enterprises did not form part of the final sample size. Pre-Testing was conducted to check the questionnaires structure and the sequence, meaning and ambiguity of questions. This process assisted in illuminating any potential problems of the research instrument and provided a basis for design or structural changes. This was also done to test the reliability, validity and workability of the instrument.

Estimated Regression Model

$Y_i = \beta_0 + \beta_i (TL_i) + \varepsilon$

Where:

Y = Growth of the i^{th} MSE

TL = Transformational Leadership of i^{th} MSE

β are coefficients to be estimated and

ε is the error term.

The collected data was cleaned, coded and summarized using frequencies, percentages, mean and standard deviation. It was then analyzed using descriptive statistics and regression model and presented in form of tables. A correlation analysis was conducted to identify the magnitude of Transformational Leadership on enterprise growth. The

correlation analysis was also used to examine multicollinearity. Then a multiple linear regression model was used with growth index as the dependent variable and transformational leadership as the independent variable. The coefficient of determination (R^2) was used to interpret the goodness of fit of the regression model.

4.0. Findings and Discussion

4.1 Descriptive Statistics

This study targeted 384 women-owned MSEs in Kasarani Division of Nairobi County. However, due to stratification and subsequent rounding of the proportion of enterprises to whole numbers in different sub-sectors, 400 women-owned MSEs were eventually surveyed. The mean age for the sampled women was 32.5 (SD = 7.5) years. The findings indicate that the sample was fairly split between the age categories of less than 30 years and between 31 and 50 years. This indicates that the sample was largely diverse across age groups.

The study results further indicate that all the respondents had attained at least primary level education, with most having attained secondary level education. This is an indicator that the sampled respondents were likely to have been acquainted with basic business management skills, including leadership skills. Over 90% of the sampled respondents were drawn from the nuclear family type. The rest of the respondents indicated that they were from either extended or single parent type of families. Finally, the findings indicate that over 80% of the sampled women entrepreneurs were parents of between one and four children aged below 16 years. This shows that most of the respondents had family responsibilities to attend in addition to their daily business duties.

Assessment of the previous employment profile of the respondents was based on five attributes namely: whether or not the respondents had engaged in formal employment; the level of satisfaction derived from past employment; number of previous employers; whether or not the respondents had engaged previously in managerial positions. The finding shows that 49 out of the 400 sampled respondents (13.3%) had never been employed. Further, 37.3 % of the respondents had only one previous employer. The remaining respondents had switched employers for more than once. The results further indicate that most of the sampled respondents (69.3%) had never been engaged in formal employment. Further, slightly over 4% of the surveyed respondents were satisfied with their previous formal employment.

The surveyed enterprises were relatively young with the modal class being between 2 and 5 years old. The mean age of the sampled businesses was 5.4 years (SD = 3.1). Most of the surveyed respondents had operated in their current business sector for less than 5 years. This indicates that most of the surveyed women had limited experience in the business sectors that they operated in. Over 85% of the surveyed enterprises were operated as sole proprietorships. Further, majority of the businesses were either owner-managed or managed with support from immediate family members. These results are an indicator of capacity constraints. The surveyed enterprises were also constrained in accessing formal finance. In the 12 months preceding the study, a majority of the sampled businesses (65.5%) had not borrowed money for business operations. Moreover, most of these enterprises (46.8%) had only obtained finances from informal sources (self-help groups, relatives and friends).

A growth index was computed by summing up the six dimensions of growth. The overall mean of the computed growth index was 3.01 (± 0.46). This growth index had satisfactory psychometric properties (Cronbach's $\alpha = 0.61$) and there was no significant change in its internal reliability by deletion of any item. The surveyed women rated meeting business objectives highest at a mean of 3.60 (± 0.61) and coming up with new products lowest at a mean of 2.51 (± 1.01).

Table 1: Correlation Analysis of the Dimensions of Growth

	Mean	SD	1	2	3	4	5	6
The enterprise:								
1. Meets its objectives	3.60	0.61	1					
2. Uses the fewest possible resources to meet its objectives	2.86	0.62	0.53*	1				
3. Develops its capacity to meet future opportunities and challenges	2.74	0.72	0.07	0.21*	1			
4. Satisfies all participants, stakeholders, employees and customers	3.03	0.89	-0.21*	-0.15*	0.42*	1		
5. Comes up with new products and processes	2.51	1.01	0.06	0.21*	0.27*	0.37*	1	
6. Offers products of high quality	3.32	0.77	0.15*	0.30*	0.10*	0.14*	0.60*	1

*Significance $\rho < 0.05$

Table 2: Reliability Assessment Statistics

Factor	Factor Indicators	Cronbach's Alpha
Idealized Attributes	I Instill pride in others for being associated with them; I go beyond self-interest for the good of the group; I act in ways that build others' respect for me; I display a sense of power and confidence	0.82
Idealized Behaviour (IB)	I talk about my most important values and beliefs; I specify the importance of having a strong sense of purpose; I consider the moral and ethical consequences of my decisions; I emphasize the importance of having a collective sense of mission	0.73
Inspirational Motivation (IM)	I talk optimistically about the future; I talk enthusiastically about what needs to be accomplished; I articulate a compelling vision of the future; I express confidence that goals will be achieved	0.77
Intellectual Stimulation (IS)	I seek differing perspectives when solving problems; I get others to look at problems from many different angles; I re-examine critical assumptions to question whether they are appropriate; I suggest new ways of solving old problems	0.69
Individual Consideration (IC)	I spend time teaching and coaching; I help others to develop their strengths; I treat others as individuals rather than just as a member of the group; I make personal sacrifices for other' benefits	0.74

The sampled respondents had a summary idealized attribute score that was above the validated benchmark levels (2). This reflects relatively high idealized attributes amongst the respondents. The idealized attribute scale identifies respondents who are able to build trust in their followers. The respondents are therefore able to inspire power and pride in their organizational teams, by going beyond their own individual interests and focusing on the interests of the enterprise and of its members.

Table 3: Descriptive Statistics of Dimensions of Transformational Leadership

Sub-scale	**Mean (± SD)**	**Normative Values* Mean (95% CI)**	**Difference (Mean- normative value)**
Idealized Attributes	2.95 (0.47)	1.50 (2.53, 2.69)	1.46
Idealized Behaviors	2.76 (0.59)	2.75 (2.28, 2.97)	0.02
Idealized Motivation	3.25 (0.66)	2.50 (2.67, 3.00)	0.76
Intellectual Stimulation	2.18 (0.61)	2.25 (2.72, 2.98)	-0.02
Individualized Consideration	2.02 (0.66)	2.75 (2.59, 2.64)	-0.56

* Source: Bass and Avolio, 2000; 1995

The surveyed respondents had an average score on the idealized behaviors scale that is within the global standards. This scale identified respondents who act with integrity and manifested positive and highly valued behaviors, like dominance, consciousness, self-control, a high moral judgment, optimism and self-efficiency. They talk about their most important values and beliefs; they focus on a desirable vision and almost always consider the moral and ethical consequences of their actions. They also zero in on building a commonly shared sense of a vision or mission for the team or group.

The respondents had a higher average score on the inspirational motivation scale. This shows that the sampled respondents are able to promote positive expectations as well as inspire and motivate their employees, partners, or associates within their enterprises. It also indicates how well the respondents communicate their goals, manipulate images, and help others find meaning in their work. The respondents appear to articulate, in simple ways, shared goals and mutual understanding of what is right and important. They further provide visions of what is possible and how to attain them and enhance meaning and promote positive expectations about what needs to be done.

High rating on inspirational motivation items indicates the ways in which the sampled female entrepreneurs take to inspire their followers to achieve both personal and organizational goals. The findings are indicative that they look at the future optimistically and enthusiastically by providing a realizable and acceptable vision with clear communication and by presenting followers ways to reach them. The values, that the respondents adopt, can also be adopted easily by the employees. Thus, this suggests that their inspirational traits impacts cohesion through visioning behaviors that involving rapport building between the leaders and their followers. Past studies have already shown that a leader, who promotes confidence in achievement and execution of goals and tasks, speaks optimistically about the future and provides an exciting image of organizational change, exhibits idealized, inspirationally motivating behaviors (Bass and Avolio, 2000).

The respondents had a relatively low average score on the intellectual stimulation scale. This scale was used to identify respondents who were able to encourage creative thinking. This result suggests that the surveyed respondents had challenges in stimulating the ideas and values of their employees. Further, the result indicates that the sampled respondents rarely take critical approaches in solving problems that arise from within their enterprises. Through intellectual stimulation, transformational leaders help others to think about old problems in new ways. They are encouraged to question their own beliefs, assumptions, and values, and, when appropriate, those of the leader. As a consequence, associates develop the capacity to solve future problems unforeseen by the leader. Associates learn to tackle and solve problems on their own by being creative and innovative. A key measure of a leader's effectiveness is how capable the associates are able to identify new innovative ways of solving old or future problems (Bass and Avolio, 2000; Hisrich and Brush, 1984).

The low score on the individual consideration attributes is indicative that the understanding and sharing in others' concerns and their personal developmental needs are not issues of great concern to the sampled women MSEs' owners. Individual consideration shares some aspects of the mentoring concept. It deals with a focus that expands the individual's development, providing feed-back between parties and making the individual feel included in the work. Mentoring is a good framework for this dimension because of the focus on trust. The reported results show that there is minimal mentorship between the sampled female MSEs owners and their followers (staff and family support members).

Table: 4 Descriptive Statistics and Correlation Coefficients of the Sub-scales of Transformational Leadership

	Mean	SD	1	2	3	4	5
1. Idealized Attributes	2.95	0.47	1				
2. Idealized Behaviour	2.76	0.59	0.64*	1			
3. Inspirational Motivation	3.25	0.66	0.46*	0.51*	1		
4. Individual Consideration	2.18	0.61	0.39*	0.44*	0.50*	1	
5. Intellectual Stimulation	2.02	0.66	0.49*	0.60*	0.42*	0.38*	1

* Significance $\rho < 0.05$

The factor analyses yielded a one factor solution for transformational leadership (Table 5). This single factor (transformational leadership summary score) explained 58.69 percent of the variance. The Cronbach's alpha coefficient of this factor was satisfactory ($\alpha = 0.82$), and was not affected by the removal of any of the sub-scales. This single factor had a mean of 2.63 (SD = 0.46).

Table 5: Factor Loadings Based on Principle Components Analysis for the 5 Dimensions of Transformational Leadership

Aspect of Transformational Leadership	Factor Loading
Idealized Attributes	0.79
Idealized Behaviour	0.85
Inspirational Motivation	0.75
Individual Consideration	0.69
Intellectual Stimulation	0.76
Eigenvalue	2.94
Explained Variance (%)	58.70

A simple linear regression model was used to determine this relationship (Table 6). The model had satisfactory properties ($F = 195.35$, $\rho < 0.05$). The growth of the sampled women MSEs was positively and significantly associated with transformational leadership. A one unit increase in transformational leadership was associated with a 0.57 increase in growth. Further, transformational leadership explained 33% of the variation in growth.

Table 6: Test of Relationship between Enterprise Growth and Transformational Leadership

	β	SE	Standardized Beta	t-statistic	ρ -Value
(Constant) Intercept	1.50	0.11		13.65	< 0.05
Transformational Leadership Index	0.57	0.04	0.57	13.98	< 0.05
$R^2 = 33\%$, $F = 195.35$, $\rho < 0.05$					

Dependent Variable = Enterprise Growth Index**.**

5.0 Conclusions

The purpose of the study was to examine the effects of transformational leadership on the growth of women-owned MSEs in Kenya. The reported data shows that most of the surveyed enterprises were experiencing moderate growth. The results show that on average, the respondents were able to meet their business objectives, utilize resources effectively, satisfy stakeholders and offer quality products. Innovation and building the capacities of the businesses were two notable problematic areas.

The study findings confirmed previous literature that shows that transformational leadership is driven by five attributes namely idealized attributes; idealized behaviors; inspirational motivation; intellectual stimulation; and individual consideration. Three attributes scored highly among the sample (idealized attributes; idealized behaviors'; and inspirational motivation) while low scoring was reported on two attributes (intellectual stimulation and individual consideration). High scoring on idealized influence attributes (idealized attributes and idealized behaviors) indicates that idealized influence is linked to charisma. Charisma development helps in mentorship and in resolution of conflicts. Idealized influence leaders serve as role models for their employees, allow them to identify with a shared organizational vision, and overcome obstacles in ways that breed pride and belief in employees. High scores rating on inspirational motivation items indicate the ways in which the sampled female entrepreneurs take to inspire their followers to achieve both personal and organizational goals. Low scoring on the individualized consideration attributes shows that understanding and sharing in others' concerns and their personal developmental needs are not issues of great concern to the sampled women MSEs' owners.

Individual Consideration shares some aspects of the mentoring concept. Low scoring on intellectual stimulation attributes indicates deficiencies in conflict management and problem solving between the sampled female entrepreneurs and their followers. Effective conflict management can lead to better team performance, as leaders and

followers are not dragged down by infighting and indecision. This could have contributed to possible slow growth experienced in the sampled enterprises because teamwork is diminished, and speed of decision-making and execution of tasks is curtailed. Transformational leadership was further found to be positively associated with growth of women-owned enterprises. This result supports literature that suggests that transformational leadership is essential in the development of women-owned enterprises. Therefore enhancing transformational leadership is a viable option for boosting the growth of women-owned enterprises

6.0 Recommendations

There is need to formulate policies and programs on education and training in order to foster transformational leadership in women entrepreneurs. The presented results suggest that enhancing intellectual stimulation and individualized consideration among women entrepreneurs are avenues that can be pursued. The MLQ paradigm can be used to enhance the formulation and implementation of meaningful educational and training programs for women entrepreneurs. Proper coordination in the various government departments to establish quality training programs emphasizing on women leadership and knowledge in business is required.

Abstract: The Small and Medium Enterprises(SMEs) sector has an important role to play in Kenya's drive towards industrialization as well as its quest for poverty eradication. To the extent that this is true, SMEs need to grow. The limited access of SMEs to credit and financial services is often presented as one of the most important supply constraints confronting the SME sector and research findings indicate that financial problems are one of the main reasons why relatively few SMEs graduate into larger enterprises. This paper sought to analyse constraints faced by women entrepreneurs after loan that impeded growth of their enterprises. The study findings showed that a majority of the sampled enterprises have not expanded despite getting MFI loans. Major policy interventions recommended relate to an evaluation of the credit methodologies of MFIs in line with the business needs of the entrepreneurs The paper offers some background on Micro and Small Enterprises(MSEs) growth, conceptual framework, empirical review of literature on MSEs growth.

***Keywords*: MSEs, Women-run enterprises, growth, microfinance, microenterprise, small enterprise**

INTRODUCTION

There is an increasing awareness in the international Community on the important role and potential of the small and micro enterprises (SMEs) in fostering socio-economic development in both urban and rural settings. SMEs are dynamic entities. Some grow into large enterprises; some stabilize without changing their scale of operations, while others disappear. The success of these enterprises can be measured by their ability to survive and prosper (Bhalla, 1992).

MSEs are receiving attention among policy makers and scholars in developing countries with fiscal pressures constraining growth of public sector employment, and with large enterprises in turmoil, often in response to the process of liberalization, many observers see MSEs as a source of economic salvation (McGrath, 1999).

In developing countries, the MSE sector employs 30-80% of the economically active population. The sector often absorbs excess labour during periods of restructuring and responds quickly to excess demand during periods of economic expansion (World Bank, 1995). However, not all is well with this sector as most of SMEs hardly grow beyond the initial stages, and 3/5 of all new businesses die within the first five years (World Bank, 1998).

The limited access of SMEs to credit and financial services is often presented as one of the most important supply constraints confronting the SME sector and research findings indicate that financial problems are one of the main reasons why relatively few SMEs graduate into larger enterprises. The vast majority of SMEs have been established without capital from the formal financial institutions, usually being financed exclusively from savings and loans from either friends and family members or informal lenders (ILO, 1994). Lending institutions have not been enthusiastic to give loans to the poor and women who run micro enterprises. Thus, the 1980s witnessed a spectacular proliferation of non-conventional institutions (micro finance institutions-MFIs) geared to offering credit services and to some extent savings to those who had always been excluded or ignored by mainstream banking institutions, that is, women and the poor (Gellinas, 1998).

Panos, (1997) notes that micro finance schemes are often presented as the key to the development aspirations of women. The need for poverty alleviation schemes targeting women is unarguable as women own only 10% of the world's property while of today's 1.3 million absolute poor people living on less than one dollar a day; over 900 million are women.

In Kenya, the1993 MSE Baseline Survey observes that women play an important role in the MSE sector constituting 46% of entrepreneurs and 40% of employment in the sector. The 1999 MSE survey observes that women own 52% of the MSEs in urban areas compared to 48% of their male counterparts.

International Labour office (ILO, 1994), identifies factors that constrain the growth and profit potential of women's enterprises as: concentration in product markets for which there is poor demand, limited access to markets, information and efficient transportation, time taken for domestic responsibilities, lack of labour and time saving technologies and poor management and illiteracy.

The importance of improved access to credit has been confirmed by many studies on SMEs, with credit constraint featuring high on the list of constraints confronting small businesses. These studies, however, caution against regarding credit as a panacea to growth of SMEs (ILO, 1994).

This study focused on the constraints inhibiting the growth of women-run micro and small enterprises in Makadara area of Nairobi who are beneficiaries of various Micro finance programs. The study looked at the reasons why the MSEs are not growing even with accessibility to loans.

Statement of the problem

Micro finance schemes are often presented as the key to the development aspirations of women. The main reason given by MFI policy makers focusing on women is the need to empower women through social and economic development programs, a commanding focus of donor programs since the 1980's. For instance, to be eligible for CGAP funds, MFIs have to demonstrate that they are reaching larger numbers of the poor that women make up at least 50% of their client base. In Bangladesh, 94% of those who meet Grameen Bank criteria for loans are women (Panos, 1997).

In Kenya, women play a central role in the MSE sector, constituting 46% of entrepreneurs and 40% of employment in the sector. Women dominate in commerce sector. Women –run enterprise show a different dynamic than their male counterparts, tending to be small and using little start -up capital. Women's entrepreneurial activities generally involve very little money and produce little profits. Money is earned in small amounts and used to cover the daily expenses of food. Women enterprises face a different set of constraints than other entrepreneurs. (Parker 1993, McCormick 1992).

Studies show that lack of credit is not always the main constraint for micro enterprise growth and development, and that poor people demand a wide range of financial, business development and social services for different business and household purposes (Hege, 1998)

Kilemi (1997) in a study on Kenya Rural Enterprise Program (KREP) loanees observed that 45% of female –clients interviewed reported that their businesses had not grown at all or had a negative growth rate as a result of acquiring a loan.

This study therefore, sought to critically examine the constraints women entrepreneurs face after loan, which inhibit the growth of their enterprises. This study was significant in that it looked at the constraints after loan because accessibility to credit has been seen as the single most important constraint faced by female entrepreneurs yet their business are not growing even after acquiring MFI loans.

II. THEORETICAL LITERATURE REVIEW

The study reviewed five theories related to growth of MSEs. These include the Industrial organisation model, resources based view, stochastic model, human capital model and learning model.

Human Capital Model

The human capital model pioneered by Lucas(1978) is related to firm growth effect model of Penrose(1959). The growth effect model had two different arguments. The first argument is the 'resource push' argument which looks at firms as a bundle of resources bound together by set of administrative skills or capabilities which are used to deploy them as effectively as possible. The second is the managerial limits to growth hypothesis. Penrose argues that at any time there are limits to the expansion that existing managers can achieve, and limits to the management capacity due to the constraint to the expansion of the number of managers (Penrose 1959, O'Farrell & Hitchens, 1988). Lucas (1978) assumed that individual entrepreneurs have certain business or management capabilities which will influence their success in business. His other assumption was that skill varies across workers and as such the size distribution of firms is based on the relative endowment of entrepreneurial talents and skills of employees.

Human capital relates to the internal environment of the firm as evaluated from by personal and leadership characteristics of the owner-manager (Gibb and Scott, 1985 O'Farrell & Hitchens, 1988). Other factors cited

influencing firm growth include the owner's age, attitudes to growth, occupational background, personal objectives, management style, level of owner's education and training, personal values and attitudes (O'Farrell & Hitchens, 1988).

Industrial organization model

The industrial organization model looks at growth of firms from an external perspective, that is, environmental/external factors, instead of resources and capabilities that are internal to the firm, (Hitt *et al.*, 2009). This model posits that a business enterprise must first consider the external environment (industry) and choose the one that is most attractive to the firm and design a strategy that fits to the characteristics of the industry. The firm then must successfully implement the strategy to increase its level of competitiveness in order to generate above average return.

Learning Model

The learning model introduced by Jovanovic (1982) and discussed in the literature on small firm growth by(e.g Liedholm & Mead, 1999; Storey, You, 1995; 1994). Jovanovic assumed that management ability differs among entrepreneurs. Further, he assumes that firms have different efficiencies which are not directly observable. He asserts that a firm's true efficiency can only be learnt gradually after the firm enters into production. A firm will adjust its behaviour upon learning about its true abilities . Beside choosing output levels to maximise expected profits on the basis of imperfect information on their efficiency levels, firms will also update their expectations based on the efficiency level. Firms which adjust their ability upward will expand and those which adjust them downward tend to contract or exit (Liedholm & Mead, 1999; Storey, 1994; You, 1995). The learning model predicts that firm failure rates and growth rates will be inversely related to the age and size of the firm (Liedholm & Mead, 1999).

Stochastic Model

The size distribution of firms at a given point in time is the result of a stochastic process from cumulative random shocks over time (O'Farrell & Hitchens, 1988). The stochastic model posits that the probability of firm growth is based on pure chance and the size distribution of firms in an industry reflect these stochastic processes.

Resources Based View(RBV)

RBV looks at the unique resources and capabilities owned and controlled by each firm as the bases upon which the firm can generate above average return or higher growth than competitors. The theory contends that all firms face the same external environment and that firms with strong internal capacity can exploit environmental opportunities and in addition challenge any external threats and challenges. This implies that while firms with unique resources and capabilities earn superior profits, firms with marginal resources can only expect to breakeven (Barney, 1991; Petraf, 1993).

III. EMPIRICAL LITERATURE REVIEW

Role Of MSE Sector

Nearly three quarters of the developing countries in the world depend on micro enterprises for employment and the general improvement of the living standards of their citizens.

In these countries, outside agriculture, micro enterprises form the bulk of their income earnings. Households that depend on agriculture, also have part time or seasonal micro enterprise activities to supplement earnings from agriculture (Digest, 1999).

The 1999 baseline survey found that there are 1.3 million MSEs employing about 2.4 million people, or approximately 17% of the total labour force. In terms of Gross Domestic Product (GDP), the contribution of the MSE sector was found to be18.4%(ICEG, 2000).

Dondo (1999) notes that a significant proportion of activities in Kenya's urban areas is accounted for by MSEs. He further observes that the role played by MSE's in the urban areas in terms of employment creation, income generation, economic diversification and dynamism has made the sector to be the last hope for future industrial growth and development.

ICEG, (1999) notes that the growth capacity of the MSE sector has the potential to contribute great strides towards the achievement of Kenya's goals for industrialization, rapid employment generation, and poverty eradication.

MSEs Lack Of Access To Formal Credit

Less than 2 percent of poor people have access to financial services from sources other than moneylenders, while fewer than 10 million of the 500 million people currently running Micro and small enterprises have access to loan or savings facilities. Banks have tended to assume that the needy will not keep up repayments, or that costs of servicing transactions on small loans must make grassroots lending unprofitable. Commercial Banks, however, have begun to

show growing interest in investing in MSEs. Yet some banks, through caution or through lack of familiarity with this market growth area, appear to be holding back from responding to current market demand (Panos, 1997).
Working capital is the most common constraint identified by entrepreneurs of existing micro enterprises. To access working capital, micro entrepreneurs often borrow from informal financial source such as family or friends, suppliers or local moneylenders. Usually moneylenders charge relatively high interest rates and may not offer loans products or terms suited to the borrower (Ledgerwood, 2000).

Felsenstain and Schwartz, (1993) in a study on constraints to small business development in Israel concluded that the major constraint facing all entrepreneurs at the start up and sustained operations stages is a shortage of capital. In their research, lack of capital was cited as a principal obstacle by over seventy percent of the respondents. The study, however, was based on rural micro enterprises since only the peripheral areas of Israel were studied.

Levy (1993) studied obstacles to developing small and medium enterprises in Sri Lanka and Tanzania and concluded that finance represents the binding constraint on expansion of all classes of enterprises.

Khandker (1995) in a study on the Grameen Bank notes that informal lenders have traditionally provided credit to rural people but because of their excessive interest rates, are considered inefficient for improving productivity. The bank holds that lack of access to credit is the biggest constraint on the poor.

World Bank lending for SMEs provides credit under the assumption that financial markets are working imperfectly and that lack of access to available finance is a critical constraint on the SME growth (Webster, 1992.).

In Ghana, when enterprises were asked to indicate the four most serious constraints that were hindering expansion of their business over 43% of sampled firms listed lack of access to credit as their primary constraint. Smaller firms tended to cite lack of access to credit more frequently than larger ones, but it was the dominant constraint in all size categories and for both older and new firms. (Ernest, 1997).

In Tanzania, a survey on demand for rural financial services established that the informal, quasi-informal and formal credit sources catered for only about 2.3% of the credit required by the rural and urban micro enterprises. The survey also established an existence of an insatiable demand for credit in the sampled areas. The survey also revealed that 43% of the respondent required loans for investment in agriculture and about 38% require loans for investment in business. This implies that about 80% of respondents require credit for financing agricultural production and business. (Musinga, 1997).

In Kenya, the Sessional paper No.2 of 1992 cites access to capital as one of the factors inhibiting the development of small enterprises and the Jua Kali sectors. Other factors include lack of coherent policy guidelines and unfavorable regulatory environment. Inadequate physical infrastructure, limited markets for sectors' products and services, a weak institutional infrastructure, poor information gathering and dissemination, lack of policy on gender specific issues, lack of enterprise culture, lack of managerial planning and implementation.
The 1993 Base line survey of MSES points out that enterprises are most likely to close in their first three years. Entrepreneurs cited low demand in the market (30.1%) as the most important constraint facing their enterprises, followed by lack of access to inputs (24.7%) and working capital (14.2%) as major constraints.
Bowen (1997) studied determinants of micro enterprise growth and observed that the main source of capital to entrepreneurs is own savings followed by capital from family and relatives and other sources (NGOs, friends etc). Out of 117 respondents, 92 (82.1%) identified capital as a constraint. This is mainly capital to expand the business.

Karanja (1999) studied factors that influence the effectiveness of the manufacture and marketing of furniture products in Nairobi and his conclusions were that major constraints facing entrepreneurs were financial shortcomings 30%, limited markets 20%, inappropriate premises 16%, inadequate machines 15%, competition from large business 11%, lack of managerial skills 5% and cost of accessing materials 30%. In this study, credit ranks as the second major constraint.

Kimuyu (2000) studied institutional impediments to access to credit by MSEs in Kenya and concluded that lack of working capital is the most important reason for business closure for more than a 1/3 of the enterprises. Lack of credit is the second severest problem faced by SMES, the first one being lack of demand for their products. 36.2% of MSES cite shortage of working capital as a reason for business closure. On sources of initial and additional capital, he observes that that 80.4% of MSES source capital from own or family or friends, commercial banks 1.8%, NBFIs 1.1%, ROSCAs 1.1% and Others (NGOs, Government Programs, trade credit, and money lenders 8.1%).

The limited access of SMEs to credit and financial services is often presented as one of the most important supply side constraints confronting the SME sector and research findings indicate that financial problems are one of the main reasons why relatively few SMEs in Kenya graduate into larger enterprises (ILO, 1995). To the extent that this is true, the implication is that with credit MSEs should graduate into small businesses. This study therefore analyzed constraints to the growth of female run MSEs.

Lack Of Access To Credit By Women Enterpreneurs

Women are considered in many societies as unfit to assume the responsibility of credit, despite the fact that they generally take the responsibility for the survival of their families (Panos, 1997)

Liedholm and Mead (1987) observe that in the absence of formal credit opportunities, a majority of the women entrepreneurs are forced to resort to informal borrowing through close friends and relatives, money lenders, pawnbrokers, suppliers, credit unions and village banks.

Ngau and Keino (1996) in their research found that 53% of the women had raised their capital through personal savings, while 44% borrowed from husbands, relatives and friends, only 3% had obtained their initial capital through a bank loan. 95% of the women had not acquired a loan from any financial institution citing lack of security for collateral and lack of information concerning procedures involved in loan acquisition.

A research by Kimuyu (2000) shows gender differences in the demand for credit. Male entrepreneurs borrow more than twice the amounts borrowed by their female counterparts due to their greater access to properties with collateral value. He concludes that credit markets discriminate against women-owned enterprises.

ICEG, (2000) notes that the marital status of entrepreneurs is an important factor in access to credit and control of the business enterprise. It further observes that lack of collateral limits women's capacity to borrow. This thus hampers their bid to expand their businesses, yet they are good in debt repaying.

Whereas, the literature reviewed shows a lack of access to credit by women, other studies show that women –run enterprises tend to remain small and grow more slowly than their male run counterparts even with credit availability. This current study seeks to look at the constraints hindering the growth of businesses run by women borrowers of various MFIs.

Related Literature On Growth Of Women-Owned MSEs

Grown and Sebstad (1989) observe that though it is generally harder for women than men to secure funds for investment, a lack of capital is not the only factor that may impede growth. Women are likely to work in low return sectors, than men so their profits are lower. They further note that women spend a relatively high proportion of their profit on household needs, and have less access than men to use of household funds for investment.

Studies from Bangladesh show that women tend to invest more in the household, and men tend to invest more in the business (Mosley, 1996). Goetz and Gupta (1994) observe that; the credit-giving NGOs may simply have offloaded some of its debt collection task onto the backs of long-suffering women. Yet the extent to which women can improve their living standard through micro finance may be limited by macroeconomic policies. In other studies they demonstrated that a significant number of female clients to rural MFIs do not control the use of their own loans once they have gained access to MFIs. This may explain some of the reasons why women owned enterprises fail to grow or register negative growth after loan.

The growth dynamics of women's enterprises cannot be measured simply in terms of a single firm. More attention to the qualitative aspects of growth, the risks involved, and the influence of gender is needed (Lyberaki and Smyth, 1990).

In Ghana problems inhibiting growth of the informal sector operations made access to institutional credit, lack of access to technical advice and business development services, inadequate usable information about sector policy formulation, poor location of enterprises with respect to raw materials, supplies, services and markets (Quainoo, 1999).

Women run enterprises are much less likely to grow than men-run or multi-owner enterprises. Although women owned businesses outnumber men owned enterprises, due to their lower expansion rate, they only contribute 32% of expansion jobs compared to 43% by men-owned enterprises. The survey further notes that women-owned enterprises show a different dynamic than men-owned enterprises, tending to be smaller and to grow slowly than their men-owned counterparts. It also observes that women owned enterprises tend to use smaller amounts of start- up capital to locate more frequently within the home and to rely on unskilled and unpaid workers. It further notes that women entrepreneurs face a different set of constraints than other entrepreneurs (Parker, 1993). ILO report (1994) concurs with this by observing that while both male and female entrepreneurs face constraints that hinder firms' growth, women face special constraints.

McCormick (1993) noted that some of the barriers to growth include entrepreneurship, access to scarce resources, competitive market, costs of growth, distortions created by government policy and regulation, historical and cultural factors and simple luck.

The ILO Report (1994) identifies factors that constrain the growth orientation of female entrepreneurs as access to resources, investment patterns, time mobility constraints related to domestic responsibilities, involvement in diversified activities and illiteracy and lack of numeracy skills.

In Kenya, despite the fact that in theory the laws provide for equality between women and men, this is not the case in practice. For instance, the by-laws by the local government restrict women from running businesses in their homes or being hawkers. Furthermore there exist conflicts between the city administration and the firm proprietors. The council holds excessive powers over small-scale producers.

Bowen (1997) studied determinants of rural micro enterprise growth and concluded that risk constitutes a constraint to enterprise growth. He notes that risk averse entrepreneurs run relatively smaller enterprises. The study further established lack of capital to be the most binding constraint to growth of micro enterprises. The study, however, studied a sample population consisting of 76.1% male and 23.9% female. It is therefore necessary to study a more representative sample of women so as to critically examine how the above variables relate to growth of female – owned enterprises. The study also was carried out on the premise that capital was a constraint that is there was lack of access. Thus study therefore is significant in that it studies women who have access to credit but their businesses are not growing.

Many women engaged in small enterprises find it increasingly hard to grow for a variety of reasons. Firstly, compared to their male counterparts, women have generally less access to start-up capital as well as credit opportunities. The reasons for this include the customary and legal status of women as well as their limited control over family resources. Secondly, the role played by most third world women as domestic workers as well as their reproductive responsibilities greatly constrain their meaningful participation in their chosen small scale enterprises. Thirdly, women have generally more limited access to formal education as well as relevant technical and managerial information (Berger 1989, Liedholm and Mead, 1987).

Whereas there is general evidence currently of women entrepreneurs access to credit as reflected by the many MFIs whose majority of members are women, not much has been researched as to why even with credit female run enterprises are not growing. This study therefore sought to fill this gap.

The Model.

In order to capture the relationship between enterprise growth (dependent variable) and the constraints (independent variable) the following model was used.

$G = f$ (e, t, d, c, i, et) ----------

Where,

G =Growth of enterprise
e = Level of Education
t =Business training
d = Domestic roles
c =Working capital
i = Levels of income
et = Error term.

Equation (i) above can be expanded into a regression model:

$G = \alpha_0+\alpha_{1e}+\alpha_{2t}+\alpha_{3d}+\alpha_{4c}+\alpha_{5i}+$ et

Where et is the error or disturbance term and α_0, α_1, $\alpha_3 \ldots \alpha_5$ are parameters to be estimated.

IV. **FINDINGS**

Descriptive Results

Business Expansion and Education

A majority of the respondents (59.1%) had secondary education. This was followed by college education at 20.5%. 13.6% of the respondents had primary education. Only a small percentage (2.3% and 4.5%) had polytechnic and university education respectively. Only 2 out of 6(4.5%) of entrepreneurs who had primary education had their businesses expand. For 10 out of 26(22.7%) entrepreneurs with secondary education, businesses expanded while for

16(36.4%) businesses did not expand. Of the 9 entrepreneurs with college education only 3(6.8%) had their businesses expand. The highest expansion and non -expansion was in the category of those with secondary education (22.7% and 36.4%) respectively. In the university category, one business expanded out of 2 representing (2.2%). The Pearson (P) value of 0.93285 is not significant at 0.05 level of significance. We deduce that there is no relationship between business expansion and education.

Business expansion and Income

The table above shows that 40.9% of the respondents had an average monthly income of above Kshs. 6000. 36.4% had an income of up to Kshs.2000 while 11.4% had incomes of between 2001-4000 and 4001-6000. The highest number of businesses which did not expand (12 out of 16) representing 27.3% were those with incomes of between 0-2000. Of the entrepreneurs with incomes of above 6000, 9(4.5%) enterprises expanded while 9 did not. All the enterprises in the 2001-4000-income category did not expand. In the 4001-6000 income group 3(6.8%) enterprises expanded out of 5.

Using the Chi-square test at 0.05 level of significance, the Pearson (P) value was 0.09354. Therefore we conclude that there is no relationship between income and business expansion.

Business expansion and Training

From the findings, 77.3% of respondents had no training at all while only 22.7% got training from MFIs or NGOs such as Skills Across Kenya. Asked whether they thought training would be useful to their businesses, most of those who had no training answered yes. Entrepreneurs who had business training said that such training had been useful to their enterprises. Most entrepreneurs expressed the need for training in business management and marketing as well as quality control.

For 4 out of 10(9.1%)of the entrepreneurs with training, businesses expanded. Of the 34 entrepreneurs without training 12(27.3%) enterprises expanded. Using the Chi- square (P) value of 0.78567 the relationship was not significant at 0.05 level of significance.

Business expansion and Working Capital

From the study findings, 50% of those interviewed cited shortage of working capital as a constrain to the expansion of their businesses. Further, 70.5% of respondents who obtained loans from MFIs found the amounts inadequate. Only 29.5% were satisfied. Thus, such entrepreneurs still resorted to loans from shylocks to supplement MFI loans.

9 out of 22 enterprises which were constrained by lack of working capital expanded while 7out of 22 businesses not constrained expanded. Using the chi-square test of significance at 0.05 the P value of 0.53080 is not significant.

Business expansion and Domestic Responsibilities

For 52.3% of the respondents, domestic responsibilities constrained the expansion of their enterprises while for 47.7% it did not. Enterprises expanded for 11out of 23(25%) entrepreneurs who were constrained by domestic responsibilities. Businesses expanded for only 5 out of 21(11.4%) entrepreneurs not hindered by domestic responsibilities.

63.6% of the enterprises sampled had not expanded as a result of loan. The enterprises had either stagnated or declined. Only 36.4% of businesses surveyed expanded. When asked why their businesses were not expanding entrepreneurs cited the poor state of the economy and unrealistic repayment schedules.

52.3% of the enterprises surveyed do not employ any workers while 47.7% employ. 61.9% of the enterprises employing workers have not added workers since benefiting from MFI loans. When asked why they had not added employees, the entrepreneurs cited lack of expansion of their enterprises to warrant such addition. Some businesses as a result of decline or stagnation in growth either have been forced to lay off the existing employees or stop employing new ones. 38.1% of the respondents indicated an increase in workers.

A majority of the entrepreneurs (90.9%) had no other business. Only 9.1% have established other businesses elsewhere. Asked why they had not started new businesses entrepreneurs' cited non-expansion of their current enterprises as the main reason. However, most of those interviewed expressed a willingness to start an extra business as a way of spreading risk.

56.8% of women entrepreneurs interviewed used business profits for family subsistence with none being reinvested in business. On why they preferred to put all their income into family subsistence, most respondents said that their families came first. They also cited low profits, which did not leave anything for the business. This indicates a lack of

separation between the owner and the business. 29.5% of those sampled reinvested their profits back into business while only 13.6% saved the income from the enterprise. Perhaps the high proportion of entrepreneurs who use business income to meet family subsistence could explain why most of the enterprises are not expanding.
54.5% of the respondents cited loan repayment as a constrain to business growth. Most of those interviewed complained of short repayment schedules, which do not give them adequate time to generate income to repay the loans. Thus, some entrepreneur's are forced to use the principal amount obtained from the MFIs to repay the loan. However, 45.5% of respondents did not find loan repayment a hindrance to enterprise growth.

Other Findings

45% of the respondents did not keep business performance records. On why they did not keep records, many of the respondents said that profits were too low for them to bother monitoring their performance. Thus, such individuals could not monitor the growth of their enterprises. The remaining 55% kept business records. However, it is worth noting that most of the records kept were those on daily sales and clients owing the business. No attempt was made to keep records on income and expenditure.
Lack of markets was cited by 20.5% of the respondents, as a hindrance to business expansion.79.5% of those interviewed were not constrained by lack of markets.
Interest rates were cited as a constrained to business expansion by 47.9% of the respondents.
36.4% of entrepreneurs cited weak purchasing power as affecting the expansion of their enterprises. This they said was as a result of retrenchment, which had rendered most of their customer's jobless and the poor state of the economy.
Government regulations were also cited as affecting business growth by 31.8% of the respondents. Commonly mentioned were council regulations involving licensing advertising and harassment by council "*Askaris*".

Competition came out as a major hindrance to business growth, especially for women in textile manufacturing and "*mitumba"* business. This can be attributed to the fact that the quality of their products is still low.
Lack of information was cited as a constrain by 35.5% of the entrepreneurs interviewed. This was mainly information regarding marketing and new technology. Most of those who did not find information a problem, however, seemed not to understand the importance of information to business growth. Others were indifferent on the importance of information on business growth. This thus calls for education of the entrepreneurs.

Multiple Regression Results

From the above results R^2 is 0.19649 implying that 19.6% of variability in growth is accounted for by variables in the model. This implies that there are other variables other than those in the model such as type of business, lack of markets, lack of information, technology used etc. which explain growth. In addition, the small sample size as well as the limited area of coverage may have affected the result. The urban nature of the area also may have affected the result. In education for instance, earlier researches such as the 1999 Baseline Survey and GEMINI 1995 show entrepreneurs with primary education were the majority whereas in this research entrepreneurs with secondary education dominate. The unwillingness of the respondents to provide accurate and correct information also may have affected the result.

From the t-ratio of .0087 the regression results are significant at 95% confidence level. However, at 5% level of significance only domestic responsibilities and income are significant i.e.<. 05. Capital, education and training are not significant. This may have been as a result of factors outside the model, which affect both the trained and untrained as well as the educated and uneducated.

Correlation Results.

Correlation results showed a positive relationship between business expansion and working capital, business expansion and domestic responsibilities, business expansion and training while there was a negative correlation between business expansion and education and business expansion and income.

Conclusions, Recommendations And Suggestions For Further Research.

The regression analysis revealed that the variables in the model accounted for only 19.6% of the variations in the independent variable. This implies that there are other factors outside the model, which influence growth. Thus, it can be concluded that the variables in the model do not adequately explain growth.
The results showed a negative relationship between education and income with growth while domestic responsibilities, training and capital had a positive relationship. Only the relationship between training and capital confirmed the researchers' hypothesis.
From the study findings, other factors affecting growth include competition, short loan loan repayment duration, shortage of working capital, and high interest rates.
The study recommends that MFIs, government and other stakeholders should come up with policy measures to mitigate the factors hindering growth.

james.rosemary@ku.ac.ke

ABSTRACT

In the modern business world, organizations operate in an environment characterized by uncertainty and instability due to dynamism of business activities that call for innovation. Although the Kenya's Information and Communication Technology sector is among the key economic pillars, it posted 6.1 percent contribution in regard to GDP in 2016 which was the lowest contribution. The dismal performance of the ICT sector implied that the telecommunications firms are not responding to their customers as expected in the set standards of the Vision 2030. Further, the quality of service report indicated that all the firms have been fined by their regulator for failing to achieve the 80 percent minimum threshold set for compliance thus failing to meet the quality of service standards for the last five years. In the recent years, the telecommunications services have undergone a radical change due to the rapid evolution of ICT. Unlike other sectors, the innovation models in the telecommunication service providers are still inconsistent hence it calls for further investigation in the entire industry. This study seeks to develop a model that links three main variables, namely digital innovation, ICT capability, and customer responsiveness. The model will provide a solution to a gap that had received little attention by the prior research in the telecommunication industry.

Key words

Digital innovation, ICT Capability, customer responsiveness, User Experience, Value proposition, Internet of Things.

1. Introduction

In Kenya, the telecommunication sector is highly competitive since 1998 when the deregulation of the sector was introduced by the then Communication Commission of Kenya.(CA, 2017), (Waema, 2007). The industry is composed of Mobile Telephony Services, Fixed Telephony Services, Data/Internet Services, Broadcasting Services and Postal & Courier Services. Nowadays, all telecommunications firms, regardless of their sizes face the challenges dealing with the new technologies; with operating in the same way as private corporations, understanding what products are profitable and which are not, and dealing with almost constant change. To survive in today's world, telecommunication firms need to change through deregulation to become more competitive, market-oriented and customer-driven. In this environment, price is no longer the only determinant of the telecommunication industry. Speed and quality (or responsiveness) is the next source of competitive advantage especially in the telecommunication industry. These challenges would certainly require the telecommunication firms to be more innovative which in turn would also lead to better performance. The investigation on effect of innovation is important because the development of new service failure rate is very high (Su, Y., Xu, D. and Phan, P.H. (2007) In addition, most of the researches in the past have examined the effect of innovation on the operational and organizational performance in general but very little focus on the customer responsiveness. Therefore, the purpose of this paper is to discuss the current innovation in the telecommunication firms in relation to customer responsiveness, by proposing a model to be investigated in relation to this relationship.

1.1 Statement of the problem

The theme of the second Medium Term Plan (MTP), (2013-2017) of the vision 2030 indicates how the government, working through the ICT Authority, would attain the set economic targets, which include the creation of more 180,000 jobs and 8 percent contribution to the Gross Domestic Product (GDP) by 2017. According to the Kenya Economic report (2017), the ICT sector, in which the telecommunication industry is the main player, was the lowest contributor in terms of GDP rating at 6.1 percent by end of 2017 (The Kenya Economic report 2017, http://www.kippra.org). The Communications Authority of Kenya has fined the dominant market players for the last five consecutive years now for failing to achieve the 80 percent minimum threshold set for compliance thus failing to meet the quality of service standards(CA, 2017), (Www.coastweek.com) In addition, the market performance in the internet and telecommunication sector doesn't indicate a smooth curve of growth (CA, 2015)This is a clear indication that the telecommunications firms are not responding to their customers as expected by their regulator and in the set standards of the Vision 2030 as they rate below the stated percentage. The fact that the telecommunication industry environment has been affected adversely by the changing operating environment calls for adoption of digital innovation to enhance a competitive edge in terms of customer responsiveness in the markets.

2. Review of literature

The paper presents a summary of the conceptual literature on the constructs of user experience, value proposition, digital evolution scanning, skills, improvisation and customer responsiveness. This is then followed by the relevant theoretical review that discusses the main theories upon which the constructs are anchored.

2.1 Digital innovation and telecommunications firms

Innovation is about people creating values and ideas to the customers. It has become a driving force for a large number of organizations around the world. Even a small innovation would result in a cumulative strength that is capable of creating the new one (Kandampully, 2002)As marketplaces become ever more dynamic, there is a widespread recognition of the increasing importance of innovation to organizations and economies (Rowley, J.

2011,Oke et al.,2007). Taking risks is an integral part of innovation and people can learn as much from what did not work as what turns out to be successful. As information is increasingly digitized and mobile devices accelerate in pervasiveness and processing power, an arena and architecture for innovation is opened up one in which physical and digital components are combined (Yoo, Boland, Lyytinen, & Majchrzak, 2012). Recent research (Henfridsson et al., O. ,2014)); (Yoo et al., 2012) has highlighted how the unique properties of digital technology enable new types of innovation processes that are distinctively different from the analog innovation processes of the Industrial era. When engaging in digital innovation, both incumbents and new entrants face challenges and opportunities that showcase an exceptional complexity. One key aspect of this complexity is the rapid pace of digital innovation processes (Yoo, Henfridsson, & Lyytinen, 2010). Ultimately this rapid pace is enabled by the malleability of digital technologies: the ease with which they can be reconfigured (Tiwana, A., Konsynski, B., & Bush, A. A. (2010).); (Yoo et al., 2010). The rapid pace of digital innovation processes is particularly challenging as firms engage in the design of 'hybrid' or 'smart' products, via which digital components are embedded in traditional products.

Digital innovation enables service firms to gain competitive advantage (Droege S. 2009). Innovation in telecommunication firms is essential for their survival. Telecommunication services will continue to grow in line with the growth of online shopping or internet business, and more home delivery, coupled with the increased infrastructure of developing countries and rural areas. E-commerce will be a key driver in the growth of telecommunication sector with more and more people buying and selling through the Internet. People and the telecommunication articles and goods to be moved efficiently from one place to another anywhere within the country as well as overseas. Thus, an integrated development strategy for the telecommunication firms is timely as digital and physical communications are likely to complement each other.

In seeking to manage digital product and service innovation, uncertainty occurs across three dimensions: the firm's products, its digital environment, and organizational properties (see Table 1). Therefore, firms need a holistic view of digital innovation when navigating the rapidly changing digital innovation landscape. The framework presented in this article enables firms to gain such a holistic view of digital innovation, helping them to motivate and keep track of their digital innovation efforts.

N	Type of innovation	Area	Description	Indicators
1	Product	User experience	Digital products and services must offer high levels of usability, possess carefully designed aesthetic properties, and evoke engagement.	Usability, Aesthetics & Engagement
		Value proposition	Digital innovation involves an articulated value proposition; i.e., a customer segmentation including strategic pricing and positioning of the product portfolio, dynamic bundling of product units, and carefully negotiated commissions to channel owners.	Segmentation, Bundling and Commissions
2	Environment	Digital evolution scanning	In order to identify opportunities for innovation, firms need to scan their digital environment. This involves gathering information on new digital devices, channels, and associated user behaviours.	Devices, Channels and Behaviors
3	Organization	Skills	In order to reap the benefits of digital innovation, firms need to acquire new skills both internally and externally while establishing new digital roles. In doing so, firms should promote continuous learning of the unique properties of digital technologies in order to secure dynamic innovation teams.	Learning, Roles and Teams
		Improvisation	The malleability and low cost of digital technologies affords a higher degree of improvisation. As a consequence, managers need to ensure that they provide organizational members with an improvisational space where structure and flexibility is balanced in such a way that the constraints maximize creativity, dedicated time is given, and improvisational efforts are coordinated to deal with overlaps and waste.	Space, Time & Coordination

Table 1: Dimensions of digital innovation

2.1.1 User experience

In web-site navigation, users need to arrive at the desired product in a few clicks, thus measuring efficient browsing and usability is, however, not enough; the customers' experience of interacting with these web- sites is key. While the user experience design is a central differentiator and competitive force, Forrester recently reported that 97% of websites had a substandard user experience design. In digital innovation, measuring the user experience involves not only usability issues, but also the aesthetic properties of digital products and services.

Users are affected by beauty and appearance; therefore, these aspects need to be carefully lever- aged and aimed at evoking a positive emotional response from the user (Hassenzahl & Tractinsky, 2006); Tractinsky, N., Cokhavi, A., Kirschenbaum, M., & Sharfi, T. 2006). Finally, in the proposed model, the user experience is measured on the ways the firm's digital products and services evoke engagement. When seeking a way to create digital products and services that are engaging, firms need to explore and tap into values that can make the experience of their digital products and services meaningful to users (Diller, S., Shedroff, N., 2005). Creating an integrated user experience that evokes engagement is particularly important when moving beyond websites and desktop applications. User experience is the first key area that firms need to measure in order to motivate and keep track of their digital innovation efforts. This is done through obtaining a composite measure of the levels of usability, aesthetics, and engagement in firms' digital products and services.

2.1.2. Value proposition

In the telecommunication service industry, dominant designs provide a structure that enable benchmarking and unified pricing. In the digital age, however, firms increasingly innovate on malleable intangibles that can be rapidly reconfigured. Therefore, while digital product categories are fragile and negotiable (Nylén & Holmström, 2015) the ongoing reconfiguration of the firm's business model has been highlighted as critical in a context of digital innovation (e.g., (Lucas, H. C., Jr., & Goh,2009)In this model, the value proposition of digital products and services is evaluated through assessing three elements, beginning with customer segmentation. This involves analyzing the customer base in order to make strategic decisions about how to reach different groups of customers with the products and services in the firm's digital portfolio.

Smartphone and tablet apps are often based on a 'freemium' model via which users can opt out of ads by paying a fee. Customer segmentation enables firms to start reflecting on the pricing and positioning of their digital products and services. Having segmented the customer base, firms need to decide how the products and services in their digital portfolio can be differentiated and bundled. This includes the specific configuration of the balancing of premium and free and the role of advertising in each of the firm's digital products and services, as well as defining boundaries between them while defining units in each of them. Therefore, when engaging in digital innovation, firms need to consider how products and services can be bundled in new and innovative ways. In contrast to traditional product licensing models, firms engaging in digital innovation are faced with commissions of channel owners. Value proposition, dealing with how value is created and captured in each digital product and service, is thus the second key area to assess for firms that seek to achieve successful digital innovation management.

2.1.3. Digital evolution scanning

The nature of digital technology implies that it evolves in a 'recombinant' or 'combinatorial' manner. This refers to the ways in which hardware circuits and lines of code are configured to interact in new ways. In other words, digital

technology seems to evolve out of itself, starting with a few simple hardware and software components, combined in several rounds over time into more and more sophisticated and integrated ones, forming systems of increasing complexity (Arthur, 2009)During the last decade we have seen how this evolutionary process is constantly speeding up. This is not only manifested in ever-shorter release cycles of digital devices, but also in the explosion of social media and communication services and applications. This calls for revisiting established notions of strategic environmental technology scanning. Indeed, firms need to monitor these developments in order to ensure compatibility by implementing timely upgrades of their digital products and services. However, this scanning moves beyond compatibility concerns when firms seek to harness the full scope of digital innovation.

Digital evolution scanning involves identifying new opportunities for innovation. As digital innovation emerges in these acts of recombination, firms need to continuously consider how they can be active participants. That is, how can they exploit these opportunities and generate an aggregated value through creating digital products and services that utilize existing components? In doing so, firms need to keep up-to-date with and analyze the progress of digital technology and associated usage patterns. This is done through gathering intelligence on which new hardware devices are on their way to market, including components such as memory, processors, and chips, and devices such as PCs, smartphones, and tablets. While the former can enable embedding digital capabilities into traditional analog products, the increased processing capabilities of mobile devices is continuously allowing resource-demanding services and content such as films, video games, and advanced editing to be done on the same device.

Firms need to expect this evolution to continue and assess how it relates to their business. Furthermore, digital technology has enabled a re-invention of sales and distribution channels. Firms can now position and integrate their products and services with an abundance of mobile operating systems, social media sites, and app stores. Facebook is currently a key actor for many firms that utilize the platform to a varying degree, ranging from small businesses that push information out to their customers, to large players like Skype and Spotify that instead utilize Facebook to pull new customers in through formalized Facebook partnerships materialized in integrated user accounts. Finally, digital evolution scanning involves observing new user behaviours. New markets can emerge as users sometimes unexpectedly adopt a digital technology into a new use context. As noted, the ways in which devices, channels, and behaviours co-evolve is highly complex. Rather than try to reduce this complexity, firms should instead seek to harness it(Axelrod, R., & Cohen ,2000). This is done through digital evolution scanning, whereby firms can identify and exploit the structural holes in which opportunities for combinatorial digital innovation reside. Digital evolution scanning is thus the third key area that firms need to address in order to validate that they have the mechanisms in place for identifying opportunities for innovation that emerge in their digital environment.

2.1.4. Skills

Since production of quality products and content remains key, digital innovation requires new skills without making all existing skills obsolete. Three main elements should be measured when evaluating the firm's digital innovation skills. First, service industry firms should seek to leverage and translate skills obtained from developing analog products. Measuring this key area involves taking stock of the ways in which learning is supported and promoted throughout the organization. Digital innovation involves continuous learning whereby new digital technologies are explored in order to create an understanding of their unique properties. This can involve establishing conditions for retraining and incentives for existing staff to acquire digital skills. It is critical to acknowledge organizational members' spontaneous digital innovation initiatives throughout the firm.

Therefore, firms should be alert and identify organizational members that are drifting from their established roles toward improvising with digital technologies. Such talent is important to pick up in order to secure the appropriate skill sets for future projects, ultimately achieving sustainable digital innovation management. While new roles can

emerge from within the organization, firms may necessarily recruit externally for specialized digital roles that complement existing roles. In combining such roles, it is a key challenge for managers to assess the current status of organizational members' skills, ensuring that they can be fruitfully assembled in dynamic innovation teams with the right combination of skills for each project. Therefore, firms need to carefully consider the balance between carrying out digital innovation projects in-house and engaging specialized external consultants.

While managers may prioritize involving leading consultants to achieve supreme digital service de-signs in individual projects, developing in-house skills ensures the agility needed to handle the rapid pace of digital innovation processes. In large firms, this could involve sourcing and combining resources and skills from multiple countries and divisions within the firm. Guided by the composite measure on this fourth key area, managers can organize their digital innovation teams to address the rapid un-folding of digital innovation processes.

2.1.5. Improvisation

This paper argues that by promoting improvisation through- out the organization rather than trying to impose a central control on all digital innovation processes, contemporary firms can harness complexity through combinatorial innovation. In this context, improvisation is defined as ''the conception of action as it unfolds''(Cunha, M. P., Cunha, J. V., & Kamoche, K. 1999). Although it often emerges as a consequence of formal plans not playing out, managers can intentionally employ improvisation as a deliberate strategy (Pavlou, P. A., & El Sawy, O. A. 2010). In the digital realm, improvisation is often an act of reconfiguration. The malleability of digital technologies affords a higher degree of improvisation than their analog counterparts.

Improvisation involves risk taking, and in the context of digital innovation, the low cost of digital technology also means a lower cost of failure. Therefore, managers need to ensure that they provide organizational members with an improvisational space in which structure and flexibility is balanced in such a way that the constraints maximize creativity while evoking generatively (Avital, M., & Te'eni ,2009);(Yoo et al., 2012). Allocating time for improvisation is key; we have recently seen how Google allocates 20% of employees' working hours to individually initiated projects and 'skunkworks.' In digital innovation, improvisational efforts typically occur across different units, levels, and divisions of the firm. Therefore, it is critical for firms to establish mechanisms for capturing the successful outcomes of such efforts.

Meanwhile, in order to deal with overlaps and waste, coordination is a key measure. Digital innovation requires an organizational culture that allows for improvisation and, thereby, also failures throughout the firm. Improvisation is thus the final key area to be assessed by firms that seek to achieve sustainable digital innovation management.

2.2 Customer Responsiveness

This paper defines customer responsiveness as the extent of capability of a firm in providing speedy services, variety of services, and willingness to help customers within the service delivery system (Razalli, M. R. (2008). In other words, responsiveness is the operational performance that measure capability of the service providers in terms of time, quality and flexibility in relation to their customers. Prior studies have found that customer responsiveness is substantially important in the logistic companies especially the telecommunications firms. Indeed, one of the most important determinants of the firm's success in competitive markets is the firm's capability in providing its customers with proper responds to their needs (Jayachandran, S., Hewett, K., & Kaufman,2004). A rapid respond to customers' requests may position the firm as a first mover in the market and as a result enhances the performance of the firm in

the market .Customer responsiveness is also an important factor that significantly and positively affects the firm's performance in telecommunications sector (Sousa, C.M., Ruzo, E. and Losada,2010)

In order to achieve superior customer responsiveness, a firm must have the ability of doing a superior job over its rivals in identifying the right needs of its customers and fulfilling their satisfaction which can eventually generate a differentiation based competitive advantage and ultimately enhances its firm performance. For example, studies found that the level of responsiveness (in terms of speed) is influenced by the service delivery as an innovation (Sheu, C., Yen, H. R., & Chae, 2003) . Specifically, the use of technology in the service industry has been found to influence responsiveness (Poria, Y., Oppewal, H. 2003). A recent study on responsiveness also found that digital innovation influences responsiveness (Kritchanchai, D. (2004).Besides that,(Arias Aranda, 2003) discovered that service delivery is significantly related to service flexibility. Other studies have shown that the competence to innovate (Menor, L.J. and Roth, A.V. (2008).) and the firm's new innovation development process (Sundbo ,1997) could lead to a greater organizational performance. A study by (Chen & Tsou, 2012)also supported that a firm's decision to develop digital innovation for firm performance depends upon the innovation. Therefore, we conclude that digital innovation should lead to customer responsiveness.

2.3 Review of relevant theories

The conceptual discussion has paid attention to the nature of the key constructs in the conceptualization emanating from digital innovation to create a phenomenon leading to customer responsiveness. Some theories could prove useful in offering the needed explanation of the behaviour of the phenomenon within the context of the discussed constructs. The paper thus will consider the postulates and contributions of the: Resource-Based View (RBV) of the firm, Diffusion of innovation theory and Technology Acceptance model.

2.3.1 Resource- Based View of the Firm theory (RBV)

Barney's 1991 article "Firm Resources and Sustained Competitive Advantage," is widely cited as a pivotal work in the emergence of the resource-based view. However, some scholars argue that there was evidence for a fragmentary resource-based theory from the 1930s. RBV proposes that firms are heterogeneous because they possess heterogeneous resources, meaning firms can have different strategies because they have different resource mixes. The RBV focuses managerial attention on the firm's internal resources in an effort to identify those assets, capabilities and competencies with the potential to deliver superior competitive advantages. The essential idea of RBV is to leverage the companies' resources, particularly the internal sources (Kraaijenbrink et al. & Kraaijenbrink, Spender, 2010), and core competencies to generate a sustainable competitive advantage which also includes the degree of customer responsiveness. It focuses on costly-to-copy attributes of the firm as fundamental drivers of performance and competitive advantage (Barney, Jay, " Management Science, 1986, Vol. 32, No. 10). RBV theory is based on the idea that the effective and efficient application of all useful resources that a company possesses helps determine its customer responsiveness, and by extension, its performance.

2.3.2 Diffusion of Innovation Theory

According to Lieberman, M.B. and Montgomery, D.B. (1988), inventions are by definition, only introduced by one firm, or at most by a small handful of firms that bring a new product or service to market simultaneously. Companies that succeed in commercializing an invention are sometimes known as first movers. If an invention involves proprietary technology, then the first firm to obtain the patent or copyright wins the exclusive right to market the product. Chandler (1990), states that pre-emption of scarce assets can sometimes provide an advantage to one or a few first movers that will not be available to those that adopt the innovation later. According to Rogers (1983), the

creation of buyer switching costs can also provide an advantage to one or a few first movers that are denied to followers.

Firms seeking to gain one or another of these advantages are sometimes referred to as first movers. Those that do not aim for invention, but innovate by adopting an invention that appears to be a winner, can be said to be late movers. Even if an innovation is clearly incremental rather than radical, the first mover is introducing or seeking change to a greater degree than the late mover, who waits until an invention no longer seems new to the market or the industry before adopting it (Tushman and Anderson, 1986). Both supply and demand side factors influence the decision to adopt. From the demand perspective, there is some consumer demand for this facility. On the supply side, protection of reputation, competition, cost savings, mass customization, enhancement of marketing and communication activities, and retention and attraction of consumers have been cited as influential factors on the diffusion of Internet depositing (Daniel and Storey, 1997).

In the current business world, enterprises have entered the era of low profit and increasing competition. Competition is already up to the strategic level and becomes the key to success. Therefore, under the competitive environment, achieving competitive advantage is considered as the ability for a company to stay ahead of present or potential competition (Porter, 1985). Consequently, organizations in the telecommunication industry are operating in increasingly competitive market and innovation is often a necessary condition for their survival. The ability of a firm to innovate is ever more viewed as the single most vital factor in developing and supporting customer responsiveness. In the telecommunication sector, innovation is aimed at developing a change adept organization that anticipates, creates and responds effectively to change in the external and internal environments to increase customer satisfaction, along giving the firm competitive advantage over its competitors.

2.3.3 The Technology Acceptance Model

TAM as a theoretical model helps in evaluating the effects factors such as system characteristics on user acceptance(Davis, F. D. ” MIS Quarterly (13:3), 1989). Under TAM model, it is assumed that the user of a computer acts in a rational manner and uses information systematically in order to judge on whether to adopt the technology. Davis, F. D. (1989) acknowledged three major motives related to the acceptance of technology that relate to effectiveness and cognition.TRA was adopted as the basis for causal links between perceived importance, use of behavioral intention and technology attitude to explain adoption of technology.

TAM model advances that Prospective user's (PU) and Perceived Ease of Use (PEOU) beliefs are of great significance for the acceptance of technology. The probability that use of an application will lead to performance increment is illustrated by the PU component. If firms in the telecommunication industry perceive the cost of digital innovation as acceptable, they are likely to adopt them and use them for better customer responsiveness.

3. Call for a theoretical model

The reviewed conceptual, theoretical and empirical literatures in this study have brought out several constructs that will play different roles in a phenomenon involving digital innovation and customer responsiveness in the context of telecommunication firms. Specifically the review has brought out the following constructs: user experience, value proposition, digital evolution scanning, skills, improvisation and customer responsiveness.

3.1 Proposed Theoretical model

Based on the above discussion, this paper proposes the following model to be further investigated. The basic argument is that customer responsiveness is influenced by the digital innovation at telecommunication firms. The relationship is moderated by the level of ICT capability by the firm

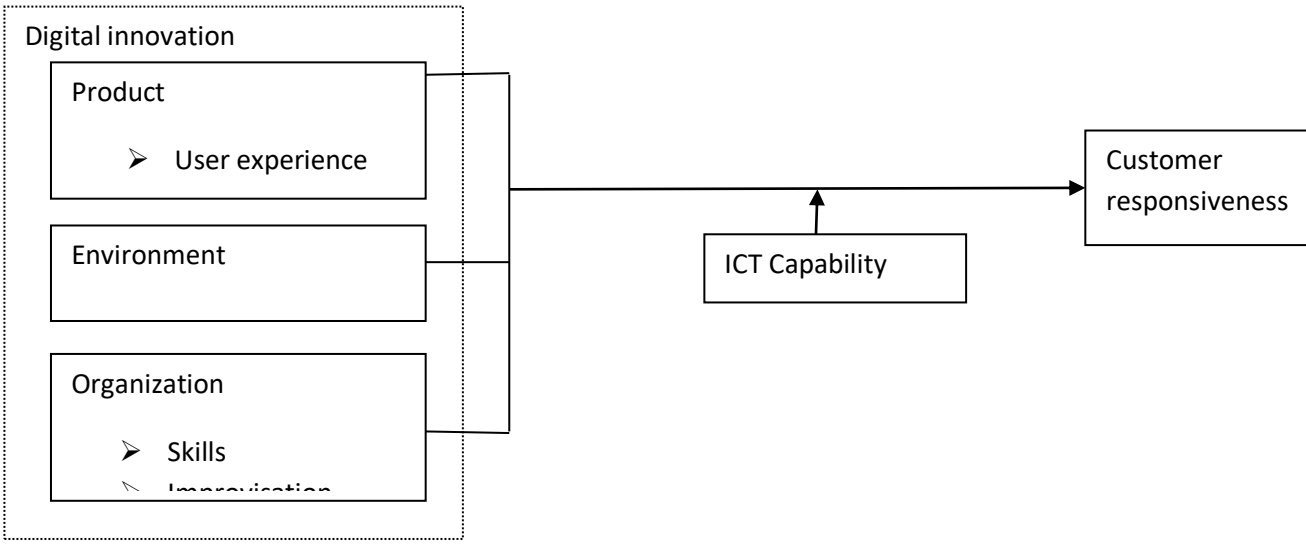

Figure 1: The Proposed model of Digital innovation and customer responsiveness

3.2 Digital innovation and customer responsiveness

Today's digital influences such as the cloud, increased mobility and cognitive computing technologies, mean that the opportunity to capitalise on the Internet of Things (IoT) is bigger than ever before. Business processes, including the supply chain, have become more flexible. It will be easier to provide customisation of products and services on-demand, fuelled by customer needs and facilitated by real-time access to information. For brands, these improvements mean faster, more cost-efficient flow of information, fusing business processes with intuitive consumer interaction data, ultimately providing a more powerful basis to execute from.

A new family of products is currently emerging as digital components are embedded in traditional products. Frequently referred to as 'smart products,' the embedded digital components enable firms to complement physical goods with online and mobile services that utilize the data generated ((Bharadwaj, El Sawy, Pavlou, & Venkatraman, 2013). Innovation is quickly becoming the new norm, with many global companies participating in open innovation initiatives and using APIs and technology platforms to deliver better outcomes. For many organisations, the increase in access to and the volume of behavioural data creates challenges in relation to storage, usage and security. In terms of customer experience, the increased amount of behavioural data means being able to demand a fair "value exchange". If consumers share more data, they will undoubtedly expect something in return. If you want a return on investment on data and how you use it, this is a critical note to make. When users leverage digital technologies as components or plat- forms to create new products and services beyond the original design intent (Yoo et al., 2010), it can result in cascades of innovation, whereby each innovation provides a platform for the next cascade.

The effects of the IoT will mean an increase in customer retention for forward-thinking businesses, thanks to advances in technology and smart devices. Customer interactions will be managed more intuitively and negative exchanges will be reduced thanks to the ability to personalise and hone in on customers' requirements. For companies that want to leverage these trends, they need to establish how they can derive the most value out of the IoT. Things are moving faster than ever and for businesses to keep up, they need to be prepared for digital disruption, open to innovation and must work towards effectively managing previously unknown growth opportunities. As digital technology becomes increasingly ubiquitous and affordable, hindrances are removed for engaging in digital innovation, thus enabling new constellations of actors to generate, develop, and fund novel digital products and services (Yoo et al., 2010). Progression within customer experience and communities will mean that satisfied customers can, in effect, be turned into an active sales force. In this way, brands can create new market share and generate new streams of income through providing flexibility for their customers. Through new technologies, complex tasks can become easier, which naturally impacts how businesses can serve their customers, by changing, or disrupting the needs of customers. Services that are available today such as same day delivery and mass customisation can become more automated in order to achieve more customer value through digital means. In this case, embedded digital capabilities enable real-time monitoring and service forecasting instead of scheduled servicing (Westergren & Holmstro¨M, 2012).

3.3 Role of ICT capability on customer responsiveness

In order to raise the digital innovation capability in the era of e-commerce, there is need for logistics service providers to employ new information technologies (Nixon, 2001). Adopting innovative logistics technologies may enable logistics service providers to enhance their service abilities (Lin, C.Y., 2007). Adopting technologies may involve five stages: awareness, interest, evaluation, trial and adoption (Weber, D.M., Kauffman, 2011). Awareness stage is when someone starts to learn the existence of a new technology. The next stage happens when they start to gather information about the new technology. The third and fourth steps are when they analyze and try out the new technology. Finally, after decision being made, they will adopt the technology. Companies can use ICT for both efficiency (cost and time saving; doing things right) and commercial advantage (providing superior value; doing the right things). ICT capability can also affect the companies throughout their value chain, starting from procurement, transformation, marketing, and distribution processes to their customers (Regan, N., A. Ghobadian,2006).

In general, ICT is a tool for innovation, but ICT capability is the ability of the firms to understand and utilized IT tools and processes for achieving competitive advantage (Ringim, K.J., M.R. Razalli, and N. Hasnan. 2010)The definition of ICT, however, is still quite vague and confusing in literature. Many authors have used ICT, e-commerce, Internet, and e-business interchangeably (Southern, A. and F. Tilley ,2000) One study explained that ICT is related with a wide array of technology, ranging from database programs to local area networks (Matlay, H. and M. Addis, 2003)Moreover, the results of the studies on the effect of ICT on innovation are inconsistent. A study by (Johannessen, J.-A., J. Olaisen, and B. Olsen, 1999) suggests that ICT by itself does not encourage or discourage innovation. It is the people working in the organization that create innovation, not ICT. ICT is more or less like a tool to be used for innovation, since new technology can help companies to do things in a new or better way. Another study, however, has found that the use of ICT has a positive relation with innovation and performance, which is due to learning and adjustment, boosted by the maturity in using ICT by IT companies. A study also found that IT capability is a strong moderator in the relationship between service innovation and supply chain performance (Wei-Chen & 2010). Based on this, we propose that customer responsiveness and digital innovation is contingent to the level of ICT capability of the telecommunication services

4. Conclusion

In this paper, a model of digital innovation in relation to the customer responsiveness in the telecommunication firms has been proposed. The paper has found this relationship to be further unveiled due to the intense innovation and the complexity of processes involved in the telecommunication firms. The proposed relationship has been described using support from the extant literature in advancing a theoretical model that predicts the linkages among the constructs drawn from the reviewed literature. The arguments have pointed at the need for a multidisciplinary literature in explaining the linkages among the constructs involved in the phenomenon involving digital innovation and customer responsiveness within the telecommunication firms. In addition, the paper differentiates the ICT capability and innovation. The capability of ICT is expected to moderate the relationship. The findings of the model are significant to the research and telecommunication firms for their business improvement especially in becoming more responsive to their customers.

Organizational Attributes and Utilization of Financial Management Information Systems in Small and Micro Enterprises in Nyeri County, Kenya

Godfrey N. Ngunyi[1], David M. Nzuki (PhD)[2]

[1] Masters Student, Department of Management Science, School of Business, Kenyatta University, Kenya

[2] Lecturer, Management Science Department, Kenyatta University, Kenya

Abstract

The Government of Kenya identified public financial management reforms which necessitated the adoption of FMIS as the key driver to efficient public service delivery. However, small scale business organizations, such as SMEs, continue to experience challenges in the utilization of FMIS. The purpose of the study was to evaluate the factors influencing the utilization of FMIS in the SMEs in Kenya. The study sought to examine the influence of technical characteristics of information systems, staff competencies and firm's ICT infrastructure capacity, on the utilization of FMIS in SMEs in Kenya. The study was underpinned in the Diffusion of Innovations Theory, Task Technology Fit (TTF) Theory and Technology Acceptance Model. The study adopted a descriptive research design and its target population was all the 4430 SMEs from which a sample of 98 SMEs was selected by simple random sampling. Primary data was gathered using questionnaires. The data collected was edited, coded, tabulated and then analyzed using descriptive and inferential statistics. Regression analysis indicated that 89.1 percent of the variability in level of utilization of FMIS is explained by the three predictor variables: staff competence, technical characteristics of FMIS and ICT infrastructure of the SME. Based on the findings, the following recommendations are made. First, SMEs and other organizations develop their in-house management systems in order to be able to incorporate all their unique system needs. Secondly, SMEs should invest in building and enhancing the capacity of their employees on the use of FMIS. Finally, SMEs develop their ICT infrastructure by acquiring more up to date hardware and software. The findings of the study may benefit the managers and administrators of SMEs in addressing the organizational challenges that affect utilization of FMIS.

Keywords: *Financial Management Information Systems, Small and Micro Enterprises, staff competencies, technical characteristics, ICT infrastructure, utilization of FMIS.*

Introduction

Public and private organizations require up to date financial information so as to be in a position to make better choices relating to their businesses. Financial information is therefore important to users such as managers as well as stakeholders, investors, government agencies, and financial institutions such as banks; for the purpose of making decisions. (Hansen and Mowen, 2007:2). Financial information helps the organization when making management decisions such as investment, monitoring the trend of performance, taxes due, among others.

Successful utilization of an innovation demands that all the aspects of the organization make their contribution. Secondly, a good interface between the users and the system itself, is key to the success in the utilization of the system. Hallmarks of an effective management system include wide user participation, support from the top management, concise description of expectations, prudent planning and realistic demands from the potential users. According to Cooper (2006), the commitments that relate to achievement of goals and enhanced effectiveness of the financial information all determine the extent to which a given intervention such as management information system will be utilized. In

addition, Watson et al. (2009) identified the commitment of top management as vital in the utilization of a management information system, as well as the facilitation of the support for usage of the system.

Romney and Steinbart (2012) describe a financial information system as a system that has the capability to provide managerial information to enable users to manage, plan, and operate their businesses. In this sense, financial systems help the management in planning, implementation and control of processes, by availing up to date information that is reliable and relevant, to be used in decision making (Romney and Steinbart, 2012). In addition, according to Hall (2011: 9) FMIS seeks to avail management information to be used by the management, external users and the operational staff. In addition, Kieso *et al*. (2012: 5) posits that the management information system has the ability to gather raw data, process it in a usable form that can be of benefit to various categories of users. Further, Sacer *et al*. (2006: 6) asserts that the usefulness of financial information for management, emanates from the quality of the accounting processes that are applied in converting the raw data into usable form.

One of the significant capital expenditures for financial institutions is in the automized systems which makes available information to aid in designing and implementing prudent management decisions, with an overall ability to improve the performance of the organization. According to Dahlan (2013), most of the investments in ICT systems for management purposes are under-utilized in majority of the organizations despite the potential they have of turning around the fortunes of the organizations. Further, the author contends that a large proportion of organizations have in the past faced difficulties in coming up with quality management decisions due to ineffective book keeping processes and administrative errors.

Management information systems applied in financial management are able to integrate different subsystems and components and establish the relatedness of the systems, such that each sub system powers the other subsystem to enhance the output. A good financial management system gathers data from various sources, summarizes it, processes it into usable form and transmits it to the users who require it both within and external to the organization (Mc Leod and Schell, 2008). On the other hand, O'Brien (2009), the main factor that determines the success of utilization of a management information system is the support from the senior management.

Small and Micro Enterprises (SMEs) have continued to impact positively on the economy by creating employment and boosting the levels of income for majority of people. Secondly, they serve as drivers of the economy by ensuring equitable distribution of wealth and income. One of the challenges that the SMEs have faced is the use of outdated management systems which are inefficient and ineffective. The challenge can be addressed by developing or acquiring and adopting up to date financial management systems and digitizing all their operations.

ICTs' utilization in SMEs offers enormous opportunities to the SMEs. Despite the valuable potential in the utilization of ICT in financial management in the SMEs, previous research has indicated that there is slow adoption and utilization of FMIS among public and private organizations in Africa (Tsui-Auch, 2008). Furthermore, past research has indicated that use of ICT and specifically FMIS in businesses is scarce, uncoordinated and widely generalized.

Despite the potential of utilization of FMIS in the SMEs, the factors discussed above have influenced the effectiveness of utilization of FMIS in the organizations. There are factors can be summed up into organizational attributes associated with basic infrastructure issues, technological, institutional, as well as user challenges. This study sought to examine the organizational attributes influencing the utilization of FMIS in Small and Micro Enterprises (SMEs) in Nyeri County, Kenya.

Statement of the Problem

Research effort on the factors influencing the utilization of FMIS has mainly targeted public organizations. Yet majority of the privately owned financial institutions, such as SMEs, have not fully embraced the full use of integrated financial systems in financial management with most of them subscribing to manual systems. As such, the SMEs do not reap the benefits that accrue from the ongoing advancement in automation and integration of financial management systems and the available options that come with it. Research in the utilization of FMIS has been ongoing. For instance, Awino (2011) carried out a study on adoption of FMIS in public procurement performance in Kenya. Shale (2014) investigated the adoption of an e-procurement strategy, which is a form of FMIS, on the financial performance of corporates in Kenya. Miheso (2013) surveyed the adoption of IFMIS by the national government in Kenya. Kinoti (2013) studied the application of ICT in procurement, by parastatals in Kenya. On the adoption of FMIS in business organizations, Wangari (2014) investigated the effect of adoption of IFMIS on credit scoring in cooperative societies in Nyeri County. Most of the studies reviewed focused on application of FMIS on public institutions hence, research on factors influencing adoption of FMIS in small business organizations such as SMEs in Kenya is therefore scanty. The purpose of the study was to evaluate the factors influencing the utilization of FMIS in the SMEs in Nyeri County, Kenya. Specifically, the paper sought to achieve the following objectives:

i. To examine the influence of technical characteristics of information systems on the utilization of FMIS in SMEs in Nyeri County, Kenya.
ii. To evaluate the effect of staff competencies, in using information systems, on the utilization of FMIS in SMEs in Nyeri County, Kenya.
iii. To examine the how ICT infrastructure capacity affects the utilization of FMIS in SMEs in Nyeri County, Kenya.

Literature Review

The study was hinged on three theories; Diffusion of Innovations theory, Task Technology Fit Theory and Technology Acceptance Model. Financial management may be enhanced by prudent adoption of financial management systems. Ismail and King (2007) in their study of manufacturing companies reported that firms that aligned technology to the uses and the users, differ in the usage of technology considerably from the firms that do not adequately align technology to the users and the tasks to be handled. It implies that applications such as project management, financial analysis, budget variance analysis, modeling and human resource management have not been widely used by the SMEs. The finding further implied that enterprises, such as SMEs, have embraced technology at a low rate and have therefore not benefited much from the systems developed (Le Blanc & Kozar (1990). IT systems have the capacity to turn around the fortunes of an organization if well and adequately utilized, however, various organizational attributes may affect the SME's adoption of FMIS.

Many technological systems have in the past failed to achieve their intended goals since their basic functionality was not well defined right from the beginning of the intervention. According to Chêne (2009), FMIS must be designed carefully so as to meet the needs of users and the functional needs for which they are created, such as financial and accounting functions. Further, he says, the type of system adopted depends on the nature of the tasks to be handled, the data to be input, the nature of the output desired and the interfaces that are required for efficient usage. The organization must choose between over the shelf systems or custom made IT systems, depending on their unique needs. It was found out that most organizations use both custom made and off the shelve software, depending on the complexity of the task and cost.

Effective and efficient utilization of an innovation requires that the staff required to use it are competent enough in terms of possessing the requisite skills, knowledge and attitudes. Inadequate capacity and competence are the main cause of delay of sub optimal utilization of the system, According to Diamond & Khemani (2008), users of the system may be made more competent through training and capacity building. This may result in better chances of success in utilization of the FMIS.

Lack of adequate numbers of staff with IT competence cannot be easily solved by just capacity building and training. The remuneration offered by some organizations such as SMEs is not adequate to attract and motivate staff with high IT competence levels (Chêne 2009). Brar (2010) opined that low staff competence levels, is one of the factors that results in low utilization of FMIS in most organizations. On the other hand, Farelo & Morris (2006) argue that staff competence and attitude is an

issue that calls for urgent prioritization, with training being well aligned with the ICT needs and demands of organizations.

The commitment and support of the top -level management to all reform initiatives performs a crucial role in the success of implementation and utilization of a new innovation. The organization must have change champions who are respected individuals within the organization to cause the change. The champions maintain the reform momentum and commitment to reform, often taking personal risks in the process (Burke, 2002). These champions are supported and guided by a group of top-level managers (Yukl, 2002).

According to Chene (2009), implementation and utilization of FMIS is a resource intensive, complex, risky and complex undertaking that needs major changes of process in the organization; but unfortunately involves high level employees who may lack adequate motivation. Implementation and utilization of FMIS therefore requires change in technology, commitment to change among the staff as well as change in responsibilities, behaviors and skills of the staff (Rodin & Edwin 2008). By the fact that the adoption and utilization of FMIS is a complex project, it requires full awareness of all the participants on the magnitude of the undertaking. Further, according to Chene (2009), decision makers involved in the roll out must be convinced that the FMIS will offer greater benefits in excess of the inherent risks and the users must recognize the need for the new technological system that the organization is putting in place. In addition, Peterson (2008), avers that the commitment of top management features prominently among the determinants of failure or success of an information system. Diamond & Khemani (2006) asserts that the commitment of the management and the continuous involvement of the direct users and other stakeholders of the organization in all the aspects of the system are key to the success of the new ICT innovation.

Empirical studies on change management reforms affirm the importance of establishing the need for system updates and communicating persuasively to the stakeholders and other participants as much as is possible (Abramson & Lawrence, 2011). Success in the implementation of a new innovation or reform initiatives depend on the ability of the managers to communicate about the desired change clearly, to all the stakeholders, of the urgency of the reform (Rossoti, 2005). All organizations go through change at one time regardless of their size, age and industry. The operating environments are changing fast and organizations must institute change as well, in order to remain relevant. Depending on how an organization handles change, it can either survive and flourish or undergo extinction. The way businesses manage change and how successful they are at it, depends on the nature of the change, the change agents and the strategies involved in institutionalizing the change. The most vital determinant is the extent to which the people within the business understand change and how well they cope with it. The people within an organization who are subjected to the change must also have a change process such that by implementing the change, they can track it and manage the effect it has on the organization. Having a change process enables the people in the organization to monitor the change and mitigate the impact it has on the stability of the organization. A change process refers to a set of procedures that enable a team in the organization to manage and control the impact of change taking place effectively. According to Manage (2007), what matters is not the change taking place but how the people in the organization respond to the change that is taking place.

Management support is crucial to the implementation and utilization of IFMIS. The decision to implement FMIS goes a long way in instituting the change but, attaining support from the users of the new system and addressing resistance from those who are reluctant, is equally important. Management of change and overcoming the inertia towards the desired change is therefore an important part of implementation and utilization of FMIS system. (Brown, 2008). The organization should develop a strategy towards change management, considering the type of implications that the change may have on stakeholders in all calibers. An effective implementation of FMIS calls for strategies and an understanding of the culture of the organization. It also requires establishing a balance point to forces for and forces against the change. (Stebel, 2012). Education and training enables the users to internalize all the aspects of the FMIS system and ensures that they are ready to accept, adopt and utilize the new innovation in their operations (Legare, 2012). Inadequate training has been one of the significant

reasons of many FMIS systems failures (Gupta, 2010). A stream of research focusing on the utilization of FMIS has been documented. From these studies, four main categories of factors affecting utilization of FMIS by organizations can be identified as: interface, usability, information fragmentation and task-technology misfit. Ashrafi and Murtaza (2013) carried out a study on the impact and utilization of ICT on SMEs in Oman. The study sought to examine the software, ICT infrastructure, perceptions about the benefits of SMEs from ICT and the investments made by the enterprises on ICT. The findings of the study showed that only a few of the SMEs were aware of the importance of ICT on SMEs. It was found out that the main driver of investment in ICTs among the SMEs was to develop a faster and a better customer service to beat competition in the market. In addition, the study found out that most of the SMEs, which participated in the study, had a positive growth and performance among other benefits of utilizing SMEs. The challenges of utilizing SMEs identified by the study included: lack of adequate information on the most appropriate ICT packages to deploy, a high cost of ICT systems, lack of internal capabilities and staff incompetence. The study however did not address the financial management systems specifically. The present study will focus on the factors influencing utilization of FMIS in SMEs.

Karugu (2012) determined the factors affecting the implementation of an IFMIS project, with emphasis on the devolved government. Specifically, the study sought to determine the effect of the capacity of human resource in counties in IFMIS implementation, the ICT infrastructure related factors that influence the implementation of IFMIS and establish whether staff are willing to influence the implementation of IFMIS project in counties. The study used a population size of the forty-seven devolved governments in Kenya, where five counties implementing Integrated Financial Management Information System were surveyed. The study found out that, for effective implementation of the IFMIS system in devolved governments, adequate human resource capacity is needed before and after its implementation. The study revealed that one of the major challenges of IFMIS implementation was staff readiness adopt change. The study recommended that, change actors should train adequately, the users of the IFMIS system before and after its implementation. Further, the study recommended that, the ICT system's implementers should improve the county ICT infrastructure to be more stable and reliable thus improving and easing connectivity to IFMIS. However, the study only focused on the public entities.

Sigei (2013) researched on the success factors in the implementation of IFMIS in Kenya National Government ministries. Using the survey, research design, and stratified sampling method, the study used a population of professional's in the ministries, such as professionals in finance, ICT and human resource. The study classified the factors critical to the utilization of FMIS into nine categories. The factors were classified as: top level management support, risk management, capacity building, good communication strategies, prudent resource management, team spirit, appropriate infrastructure, user involvement and well set goals and objectives. Despite the fact that the study shone light on the factors influencing utilization of IFMIS, it only addressed government ministries which are nonprofit making entities. The present study focused on SMEs which are privately owned profit making organizations.

Wangari and Jagongo (2012) in a study of SACCOs in Nyeri County found that, internal control mechanisms facilitated by IFMIS, affect credit scoring among SACCOs in Nyeri to a great extent. The study also found that, centralization, formalization, hierarchical arrangement of authority and bureaucracies affect the credit scoring and the application of IFMIS among the SACCOs in Nyeri County. Despite the fact that the study addressed the utilization of IFMIS on organizations, it mainly focused on how the FMIS is applied and not the factors that affect its utilization.

Nduati (2012) established the factors that affect utilization of ICT in SMEs in Thika town. The study found out that lack of basic IT skills, high cost of IT equipment, lack of top management support, high cost of networking and the internet, as the major hindrance to the adoption of FMIS. Although the study concentrated on the SMEs, it covered ICT and focused on the adoption. The present study will

concentrate on only one aspect of ICT usage in SMEs; that is financial management systems and will concentrate on the utilization and not just adoption.

Muathe, Wawire and Ofafa (2013) in their study focusing on the adoption of ICT in health related SMEs, used an interview guide and structured questionnaires to collect data. Although the study brought out the relationship between the factors affecting ICT adoption, the present study took a wider scope of all the types of SMEs and concentrated on the utilization of FMIS and not any other applications of ICT.

Methodology

The study adopted a descriptive research design and its target population was all the 4430 SMEs in Nyeri County, from which a sample of 98 SMEs, based on Yamane's formula of determining sample, was selected by simple random sampling. From each of the selected SMEs, the owner/entrepreneur participated in the study. Primary data was gathered using questionnaires. The data collected was fine-tuned, coded and put into categories and then tabulated to facilitate analysis. SPSS was used to aid in the analysis. Descriptive statistics such as percentages, standard deviation and mean were used to carry out the analysis. Frequencies tables were used to present the data collected, for ease of understanding and analysis. Regression was used to determine nature and the strength of the relationship between the variables. The regression model to be estimated was;

$$\mathbf{Y = \beta_0 + \beta_1 X_1 + \beta_2 X_2 + \beta_3 X_3 + \epsilon}$$

Where,

Y = Performance of SMEs (Dependent Variable)

β_0 = Constant (Coefficient of Intercept)

X_1 = Technical characteristics

X_2 = Staff competencies

X_3= ICT Infrastructure

ϵ = Stochastic Error term

Results and Discussions

Pearson Correlation was used to determine the nature of the relationship between the organization attributes, related to the characteristics of the FMIS used in the SMEs, and the utilization of the FMIS in the SMEs. The level of utilization of FMIS was indicated by the number of the financial processes that are automated on the FMIS. The results obtained indicated that for all the attributes tested, the Pearson correlation coefficients were close to 1 indicating high positive correlation. Secondly, the significance (2-tailed) on the correlations were all 0.000($p<0.05$) implying high statistical significance. The findings implied that the organizational attributes, related to the characteristics of the FMIS used, were significantly statistically related to the extent of utilization of the FMIS. The findings of the study concur with those of Chêne (2009) who found out that many IFMIS projects have failed to find maximal utilization due to failure to clearly spell out the functionalities of the system at the onset.

In addition, similar to the findings of the present study, Chêne (2009) found out that, for an FMIS to be fully utilized by organizations, it must be clearly designed to address the needs of the organization. On the Staff Competencies in FMIS and its Influence on Utilization of FMIS by SMEs, the study found out that for all the attributes tested, the Pearson correlation coefficients were close to 1 indicating high correlation. Staff training and staff experience in the extent of use of FMIS were positively correlated.

The findings imply that increase in staff training and staff experience corresponds to increase in the utilization of FMIS and vice versa. On the other hand, avoidance of FMIS related tasks and assistance seeking behaviour of the staff on the use of FMIS are negatively correlated implying that increase in the frequency of the practices corresponds to decrease in the utilization of FMIS and vice versa. The correlations were all statistically significant ($p<0.05$), implying that the organizational attributes, related to staff competence, were statistically significantly related to the extent of utilization of the FMIS. Thus, staff competence was found to affect utilization of FMIS by SMEs. The findings of the study echoed those of other researchers, such as Abramson & Lawrence (2011), who found out that successful utilization, is dependent on the competence of the users.

On the effect of firm's ICT infrastructure capacity on the utilization of FMIS, Pearson Correlation carried out on the results indicated that for all the attributes tested, the Pearson correlation coefficients were close to 1 indicating high positive correlation. Secondly, the significance (2-tailed) on the correlations were all 0.00($p<0.05$) implying high statistical significance. The findings imply that the organizational attributes related to the ICT infrastructure of the FMIS used were statistically related to the extent of utilization of the FMIS.

Finally, regression analysis was carried out to determine the statistical influence of the independent variables on dependent variable (utilization of FMIS). The regression model summary of the influence is displayed on Table 1, Table 2 and Table 3.

Table 1: Model Summary

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	.944[a]	.891	.887	.329

a. Predictors: (Constant), Technical Characteristics of FMIS, Staff Competence, Infrastructure Capabilities

The results indicate that R^2=0.891 which implies that Technical Characteristics of FMIS, Staff Competence, Infrastructure Capabilities predict a significant amount of the variation in the level of utilization of FMIS. This indicates that the independent variables tested predict 89.1 percent of the dependent variable

Table 7: ANOVA

Model		Sum of Squares	df	Mean Square	F	Sig.
1	Regression	69.841	3	23.280	214.630	.000[a]
	Residual	8.569	79	.108		
	Total	78.410	82			

a. Predictors: (Constant), Technical Characteristics of FMIS, Staff Competence, Infrastructure Capabilities

b. Dependent Variable: Utilization of FMIS

The output on Table 2 indicates that the *p*-value is small (p=0.000) implying that the relationship between the predictor variables and the dependent variables is statistically significant and the model can be used to predict the dependent variable.

Table 3: Coefficients

Model		**Unstandardized Coefficients**		**Standardized Coefficients**		
		B	Std. Error	Beta	t	Sig.
1	(Constant)	.185	.147		1.261	.211
	Technical Characteristics of FMIS	.496	.059	.642	8.416	.000
	Staff Competence	.801	.085	.847	9.475	.000
	Infrastructure Capabilities	.582	.113	.534	5.170	.000

a. Dependent Variable: Utilization of FMIS

In view of the results in Table 3, the model for predicting level of utilization of FMIS is represented as follows;

$Y= 0.185 +0.496X_1+0.801X_2+0.582X_3+\varepsilon$

where; Y= Level of utilization of FMIS

X_1=Technical characteristics of FMIS

X_2=Staff competence

X_3=Infrastructure Capabilities

The constant could be explained by other variables like government policy, management support factors, SME type, among others. The regression model on contribution of the three independent variables against level of utilization of FMIS was found to be significant ($p < 0.05$). The resulting goodness of fit was $R^2 = 0.891$ indicating that 89.1 percent of the variability in Y is explained by the three predictor variables. The rest, 11.9 percent of the variation in level of utilization of FMIS is contributed by the intervening variables. Staff competence contributed most to the impact of in determining level of utilization of FMIS (80.1 percent) while; technical characteristics of FMIS contributed the least (49.6 percent) to the variation in the utilization of FMIS by SMEs. The findings of the study are consistent with those of other researchers (Bruque and Moyano, 2007; Nguyen, 2009) which found that there are a myriad of factors that influence utilization of FMIS in SMEs and can be categorized into two major clusters of factors, and their subcategories of internal and external factors. The study has however dwelled on the SME related factors only. Other factors external to the SME influence the utilization of FMIS in the SMEs.

Based on the findings of the study, the following recommendations are made;

i. SMEs need to invest in financial systems that are flexible enough and can accommodate all financial operations they need.
ii. SMEs invest in building and enhancing the competence of their employees through training and attitude change towards use of FMIS.
iii. SMEs need to provide an adequate budget to acquire standard IT hardware, software and networking equipment in order to spur the level of utilization of FMIS.

The study intended to use all the SMEs in the locale, however, this was found not practical since a large number of SMEs were not formally registered while yet others were not accessible due to the geographical constraints. Further studies could be carried out by administering the research instruments through the phone or internet to increase access. In addition, more secondary sources could be used instead of relying on primary sources only, since some of the respondents were unwilling to provide the responses for personal reasons.

Abstract

Commercial banks in Kenya operate in a dynamic environment characterized by technological changes, competition, regulatory requirements, economic changes and opportunistic strategic decisions. The stiff competition among the various players in the banking industry has lead the banks to look for more innovative ways of satisfying their stakeholders while at the same time making profits. Banks in Kenya have been involved in corporate social responsibility programs in the area of education and training, health, sustainable environment, sports and improving the livelihoods of vulnerable groups in society. Corporate Social Responsibility refers to operating a business in a manner that accounts for the social and environmental impact created by the business. As competition in the banking sector intensifies not only amongst themselves but from other competitors such as Micro Finance Institutions and Saccos, there is need to focus on other strategies to gain competitive advantage. The objectives of this study were; to determine the influence of education programs, environmental protection, and enterprise development and staff development programs as CSR activities on competitive advantage of Equity Bank Kenya Limited. The study was anchored on stakeholder's theory, strategic leadership theory and resource based view theory. The study used descriptive research design. The target population of this study comprised all the management staffs of equity bank in Kenya drawn from the head office in Nairobi who total to 145. Stratified sampling was used to draw 67 respondents. Primary data was collected using a semi structured questionnaire administered to staff using pick and drop method. Data was analysed using descriptive statistics, correlation and regression analysis. Results of the study revealed positive and significant relationship between education programs, environmental protection, enterprise development, staff development programs and equity bank competitive advantage.

Key words: Competitive advantage, corporate social responsibility, Equity Bank Kenya Limited.

Introduction

A competitive advantage is what makes an entity's goods or services superior to all of a customer's other choices. The term is commonly used for businesses. The strategies work for any organization, country, or individual in a competitive environment. (Kimberly Amado)

Competitive advantage is also how an organization will achieve its objectives in the face of competition from other organizations (Carroll & Shabana, 2010). In achieving this goal, an organization must perform better than other players in its industry must. In so doing, this could boil down to meeting the needs of the consumers more effectively and this could enable the service provider to command a higher price which can lead to increased revenues (Crowth & Aras, 2008). In achieving this goal an organization must perform better than other players in its industry.

If the company is cost effective, it can then be able to command a lower price in its offering to the consumers and this can lead to increased revenues (Thompson, 2010). However, a review of approaches for building competitive advantage illustrates that marketing plays a central role. A number of popular approaches include, strong market positions with products and services which are not easily substituted, entry barriers, strong bargaining position, mobility barriers, balanced portfolio`s, core competences, innovation and speed or time based competition. Multinational Companies (MNC`s) can promote the adoption of CSR practices as part of their strategy so as to increase their competitiveness within the economy and industry.

In competitive advantage, the current globalized world, competition has become a buzzword with regard to organizational performance and survival (Porter & Kramer, 2012). Research has established that firms, which are unable to attain or sustain greater organizational performance often, collapse (Palmer, 2012). Thompson (2010) this gives the customer a reason that lasts to prefer the company

products to competitors. An organization derives its competitive advantage from either managing their costs or providing a unique offering to their market (Crowth & Aras, 2008).

According to Reverte (2009), he contends that to attain and sustain a competitive advantage, firms have to explore several alternatives including engagement in CSR strategies. According to Weber (2008), health strategy is a fundamentally effective means of attaining a competitive advantage in a competitive business milieu as individual beneficiaries of the health assistance and their relatives, friends and acquaintances develop a feeling that they owe the firm a lot. As such, it is perceptible that a health strategy is a potentially effective way of attaining a competitive advantage.

Schwenker and Wulf (2013) have argued that increased involvement in certain CSR strategies result in the enhancement of organizational performance and competitive advantage (CA). Firms have also undertaken to increase their assistance to the health sector and the people in need of certain medical attention but lack proper resources and funds to realize such needs (Kariuki & Rotich, 2013). Hamori (2013) points out that sports strategy in CSR serves to establish a good corporation reputation, which in turn guarantees high performance by the employees. This give the firm a competitive advantage relative to its key competitors thereby allowing the firm to retain its exceeding its business performance (Harvard Business Review, 2011).

According to Westover (2010) CSR influences the rates of employee retention or employee turnover rates. Turnover is process in which employees leave the organization and have to be replaced. Turnover is related to employee motivation. Excessive turnover can be a very costly problem, one with a major impact on productivity. But cost is not the only reason turnover is important. Lengthy training times, interrupted schedules, additional overtime, mistakes and not having knowledgeable employees in place are some of the frustrations associated with excessive turnover (Westover, 2010). It has been observed that a health strategy facilitates employee motivation in fulfilling their tasks to the firm and therefore facilitate organizational performance.

1.1 Objectives of the Study

1.1.1General Objective

The main research objective was to establish the influence of Corporate Social Responsibility activities on competitive advantage of Equity Bank Kenya Limited.

1.1.2 Specific Objectives

The specific objectives of the study were to**;**

i. Establish the influence of education programs on competitive advantage of Equity Bank Kenya Limited.
ii. Examine the influence of environmental protection programs on competitive advantage of Equity Bank Kenya Limited.
iii. Determine the influence of enterprise development programs on competitive advantage of Equity Bank Kenya Limited.
iv. Establish the influence of staff development programs on competitive advantage of Equity Bank Kenya Limited

2.Theoretical Literature

2.1 Stakeholder Theory

This theory was proposed by (Freeman, 1984). Stakeholders theory states the purpose of the company as to provide return on investment for shareholders and thus corporations are seen as instruments of creating economic value for those who risk capital in the enterprise, (Greenwood, 2001). It is believed that the sole constituency of business management is the shareholders and the sole concern of shareholders is profit maximization. Any activity is justified if it increases the value of the firm to its shareholders and is not justified if the value of the firm is reduced, (Cochran, 1994). Corporate

expenditure on social causes represents a violation of management responsibility to shareholders to the extent that the expenditure does not lead to higher shareholder wealth, (Ruf, 1998). In relation to shareholder theory, this implies that company managers are obliged to adhere to the objective of maximizing long-term owner value.

Stakeholder theory emerged as an alternative to shareholder theory, (Spence et al, 2001). According to Windsor (2001), the term stakeholder represents a softening of strict shareholder theory. It recognizes the fact that most, if not all firms have a large and integrated set of stakeholders, (Cochran, 1994) to which they have an obligation and responsibility, (Spence *et al*, 2001). This theory challenges the view that shareholders have a privilege over other stakeholders, (Freeman & Reed, 1983). The stakeholder theory is a response to financial theories that assert that firms should focus only on maximizing the economic interests of shareholders, (Orts & Schulder, 2002). According to Kaler (2003), the stakeholder approach involves a basic reformist stance toward shareholder theory, seeking to move it in the direction of greater equity and a less single-minded concentration on owner's interests rather than replacing it entirely.

The theory's application to this study is premised on the backdrop that the Chief Executive Officer (CEO) of Equity Bank Limited as manager saw the need to satisfy a bigger chunk of the stakeholders and or clients by engaging in such activities as promoting and shaping the future of the younger generation by offering them the platform to curve their niche in leadership as well as in education. Through equity bank involvement in education programs they are able to train and equip young generation with skills which they can use to serve in their respective institutions. Indeed, through the work based programs for all education beneficiaries the bank will be better placed to equip and tap skills which the students have.

2.2 Strategic Leadership Theory

The theory of strategic leadership finds its roots from the evolution of management theory by (Fredrick, 1856). The essence of strategic leadership involves the capacity to learn, the capacity to change and managerial wisdom (Boal & Hooijberg, 2001). This theory highlights the functions of a leader and how they manage crisis and maintain proper organizational structures, processes and culture for purposes of gaining competitive advantage. The effort of a leader is therefore very essential in the organization of human capital, financial resource, organization structure and process to achieve a competitive stand in the market

Waldman *et al* (2004) applies strategic leadership theory to CSR and noted that companies run by intellectually stimulating CEOs do more strategic CSR than comparable firms. These authors affirm that certain aspects of transformational leadership will be positively correlated with the propensity of firms to engage in CSR and that these leaders will employ CSR activities strategically. A strategic leader displays a dissatisfaction or restlessness with the present; absorptive capacity. Beatty and Quinn (2010) define strategic leadership as a combined responsibility of the leader, the follower and the organization. Leadership presents challenges that call forth the best in people, and bring them together around a shared sense of purpose.

Strategic leadership includes determining the firm's strategic direction, aligning the firm's strategy with its culture, modelling and communicating high ethical standards, and initiating changes in the firm's strategy, when necessary. Strategic leadership sets the firm's direction by developing and communicating a vision of future and inspires organization members to move in that direction. Unlike strategic leadership, managerial leadership is generally concerned with the short-term, day-to-day activities, (Pearce & Robinson, 2007).

Equity Bank CEO provides strategic leadership to the organisations equity group foundation whose sole responsibility is social and economic transformation. With intentionality, alignment, and a higher purpose; the work between the leader and the followers can create a synergy. This makes the theory relevant based on the need for effective management and leadership for CSR activities carried out in equity bank Kenya. The theory is appropriate for the study since equity bank has endeavoured to support skills for its employees as well as beneficiaries of equity foundation from whom they can attract and recruit them to serve in their respective bank as well as equity foundation.

2.3 Resource Based View theory

This theory was first proposed by (Edith Penrose's 1959**)**. The resource-based view of the firm (RBV) draws attention to the firm's internal environment as a driver for competitive advantage and emphasizes the resources that firms have developed to compete in the environment. Ultimately, firms that are able to leverage resources to implement a value creating strategy not simultaneously being implemented by any current or potential competitor can achieve competitive advantage, (Barney, 1991). The RBV as a basis for the competitive advantage of a firm lies primarily in the application of a bundle of valuable tangible or intangible resources at the firm's disposal, (Mwailu & Mercer, 1983). Moreover, Hart (1995) was the first to apply the RBV framework to corporate social responsibility. The study focussed exclusively on environmental social responsibility and asserted that, for certain types of firms, environmental social responsibility can constitute a resource or capability that leads to a sustained competitive advantage.

The RBV has put forward a number of assumptions that may be useful in the management of organizations: Resource Heterogeneity is the first assumption which states that the resources that organizations possess differ from one company to another. If organizations would have the same amount and mix of resources, they could not employ different strategies to outcompete each other therefore RBV assumes that companies achieve competitive advantage by using their different bundles of resources. The second assumption of RBV is that resources are not mobile and do not move from company to company, especially in short-run. Due to this immobility, companies cannot replicate rivals' resources and implement the same strategies. This is truer with the intangible resources, such as brand equity, processes, knowledge or intellectual property that are usually immobile, (Hooley & Greenlay, 2005).

Barney (1991) proposed the VRIN framework that examines if resources are valuable, rare, costly to imitate and non-substitutable. The resources and capabilities that answer yes to all the questions are the ones that lead to sustained competitive advantages. Resources are valuable if they help organizations to increase the value offered to the customers. This is done by increasing differentiation or/and decreasing the costs of production. Resources that can only be acquired by one or few companies are considered rare. A company that has valuable and rare resource can achieve at least temporary competitive advantage. However, the resource must also be costly to imitate or to substitute for a rival, if a company wants to achieve sustained competitive advantage.

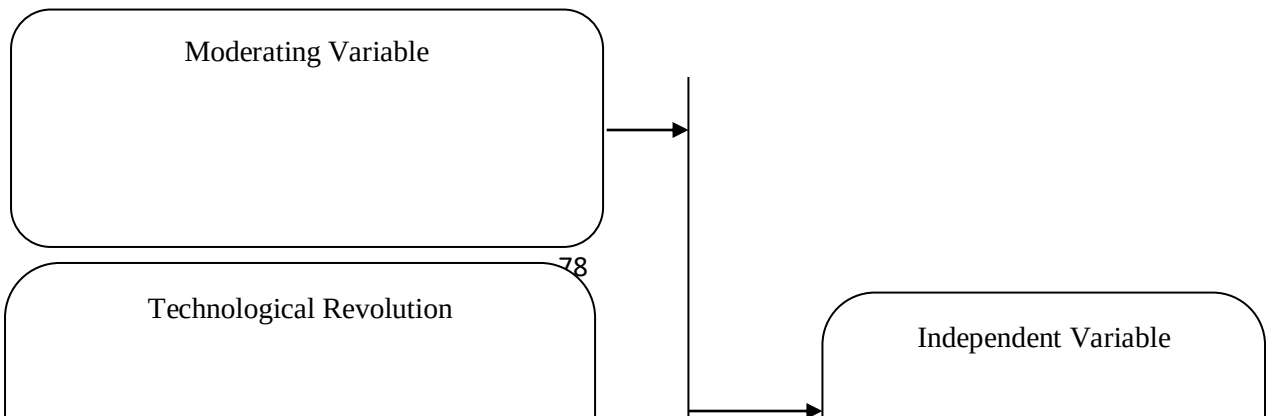
McWilliams and Siegel (2001) outlined a simple model in which two companies produce identical products, except that one firm adds an additional social attribute to the product, which is valued by some consumers and other stakeholders. In this model, managers conduct a cost/benefit analysis to determine the level of resources to devote to CSR activities by assessing the demand for CSR and evaluating the cost of satisfying the demand.

The theory is appropriate since through creation of conducive environment the bank will be able to operate optimally. Indeed, participation in environmental conservation strategies will act as an avenue to educate not only environmental issues but also a platform to promote equity product awareness. Also the theory supports enhancement of employee satisfaction through creation of cohesive programs which will promote skills development and health fitness by organizing health and sport related activities

2.4 Conceptual Framework

The dependent variable in this study was competitive advantage while the independent variable was corporate Social responsibility

Independent Variables **Dependent Variable**



3. Research Methodology

3.1 Research Design

The study adopted descriptive and cross-sectional research design which Mugenda and Mugenda (2003) posits that it is a systematic, empirical inquiring into which the researcher does not have a direct control of independent variable as their manifestation has already occurred or because the inherently cannot be manipulated. Research design ensures the study is applicable to the problem and its procedures are cost-effective for obtaining information. Descriptive research design is concerned with finding out about the how, who, when and where of a phenomenon so as to build a profile (Mugenda & Mugenda, 2003). The design was appropriate since the current study investigated corporate social responsibility on competitive advantage in Equity bank limited.

3.2 Target Population.

A population is a well-defined or set of people, services, elements, and events, group of things or households that are being investigated. The target population for study was all 145 management employees at Equity Bank Kenya Limited head office in Nairobi. These employees were categorised into 20 top level, 30 middle level and 95 in the functional level.

Table 3.1: Target Population

Category	Population size	Percentage
Top Level	20	13.8
Middle Level	30	20.7
Lower Level	95	65.5
Total	**145**	**100**

Source: Author (2017)

3.3 Sampling Size and Sampling Technique

Simple random sampling technique was used to obtain a representative sample since population of interest is homogeneous. Simple random sampling will be adopted to select 67 respondents who will be distributed in the three levels of management using stratified sampling technique. Out of 67, 9 will be drawn from top level management, 14 from middle level management and 44 from functional level. To give all respondents an equal chance of consideration simple random sampling will be used. A sample of 67 was calculated as follows according to Kothari (2011):

$$n = \frac{Z^2pq}{d^2}$$

Where:
n = sample size, N= entire Population, Z= level of significance (1.96 confidence level)

d= Expected Error, p = Probability of success, q = Probability of failure

As such the sample for this study can be derived as follows:

$$n = \frac{(1.96^2 * 0.5 * 0.5)}{0.12^2} = 67$$

Table 3.2: Sample Size

Category	Percentage	Sample Size
Top Level	13.8	9
Middle Level	20.7	14
Functional Level	65.5	44
Total	**100**	**67**

3.4 Data Collection Instrument

Primary data was collected by the help of a semi structured questionnaire. The close-ended questions provided more structured responses to facilitate tangible recommendations while the open-ended questions provided additional information that was be captured in the close-ended questions. The study used both primary and secondary data. Secondary data was collected from the records of the Equity Bank Foundation which is the CSR arm of the Equity group of companies. The CSR records showed the project undertaken and also the competitive performance information was indicated from the financial statements of the bank.

3.5 Validity and Reliability of the Study

3.5.1 Validity of the Study

Cooper and Schindler (2010) indicated that a pilot test is conducted to detect weaknesses in design and instrumentation and to provide proxy data for selection of a probability sample. According to Babbie (2004), a pilot study is conducted when a questionnaire is given to just a few people with an intention of pre-testing the questions. Pilot test is an activity that assists the research in determining if there are flaws, limitations, or other weaknesses within the interview design and allows him or her to make necessary revisions prior to the implementation of the study (Kvale, 2007). To establish the reliability and validity of the research instrument the study sought opinions of experts in the field of study especially the study's supervisor and lecturers in the school of business administration and strategic management. This facilitated the necessary revision and modification of the research instrument thereby enhancing validity.

Validity is a measure of the degree to which data obtained from the instrument accurately and meaningfully represents the theoretical concept and in particular how the data represents the variables. Where validity has been established, any inferences made from such data was accurate and meaningful (Mugenda & Mugenda, 2003). The first phase of this research employed the econometric technique to establish the relationship between corporate social responsibility strategies and performance of commercial banks in Kenya with a special focus on Equity Bank Limited. The data was collected from the organizations' departments such as human resource, IT, finance, operations, marketing and strategic management. This confirmed the validity of the data and relevant results.

3.5.2 Reliability of the Study

Cronbach's Alpha was applied to measure the co-efficient of internal consistency and therefore reliability of the instrument. In order to check reliability of the results, the study used Cronbach's alpha methodology, which is based on internal consistency. Cronbach's alpha measures the average of measurable items and its correlation. Overall scales' reliability of the present situation and the desirable situation were tested by Cronbach's alpha, which should be above the acceptable level of 0.70 (George & Mallery, 2003).

3.6 Data collection Procedure

Upon successful presentation of the research proposal, an introduction was sought from Kenyatta University School of graduate studies and it was presented to the National Commission for Science, Technology and Innovation (NACOSTI) to seek research permit.

4. Findings.

4.1 Response Rate

Although, the study had a sample of 67 respondents only 56 questionnaires were returned and correctly filled, this yielded 84%. According, to Kothari (2011) the response was appropriate because it was greater than 70%.

Table 4.1: Response Rate

Questionnaire	Frequency	Percentage
Returned	56	84
Non returned	11	16
Total	**67**	**100**

4.2 Bank Engagement in Corporate Social Responsibility

The study investigated types of corporate social responsibilities equity bank engaged in. As shown in Table 4.5 most of the respondents reported that to great extent equity bank was involved in CSR activities (mean = 4.2, standard deviation = 0.9). Most of the respondents, 53.6% reported that to very great extent equity banks was involved in education and training programs, 50% reported to great extent equity bank was involved in environmental protection programs. Further, 42.9% reported that equity bank was involved in enterprise development initiatives, and 51.8% reported that to very great extent equity bank was involved in staff benefits enhancement.

Table 4.2: Bank Engagement in Corporate Social Responsibility

	Percentage (n=56)						
	Not at all	**Little extent**	**Moderate extent**	**Great extent**	**Very great extent**	**Mean**	**Std. Dev**

4.3 Competitive Advantage

Further, the study sought respondents' opinion in regard to competitive advantage upon equity banks participation in CSR. On a five point Likert scale most of the respondents reported that to very great extent equity bank participation in CSR had influence on its competitive advantage (mean = 4.5, standard deviation = 0.7). This was accounted for in recruitment of new customers (mean = 4.2), new investors local and foreign (mean = 4.4), employee satisfaction (mean = 4.4), brand appeal and association (mean = 4.5), entry into new markets (mean = 4.6) and accomplishment of strategic plans (mean = 4.7).

Table 4.3: Competitive Advantage

	Percentage (n=56)						
	Very low	**Low**	**Average**	**High**	**Very High**	**Mean**	**Std. Dev**

5. Conclusion and further research

5.1 Conclusion

Based on the study findings the following conclusions can be drawn. CSR had significant influence on equity bank competitive advantage and accounted for 80% of its competitive advantage. Therefore, there is need for equity bank to amplify its participation in CSR activities more so in education and training programs, environmental protection programs, enterprise development programs and staff development programs.

Owing to success rates in equity banks wings to fly education programs, there is need for a diversified education program to be developed. Since the current program is skewed towards academic achievement, there should develop a program geared towards recognizing and rewarding outstaying talents. Through this participation in co curriculum activities will be enhanced and can aid in breaching of unemployment gaps.

Secondly, there is need for corporate organization participation in environment protection programs. Although, these programs may be expensive they may be avenues through which corporation can enhance its market penetration. Indeed, involvement of equity bank in tree planting and forest protection programs will not only portray them as environmentalist but also improve their brand association with current desire to alienate current threats.

Thirdly, entrepreneurship is the main yardstick which can be deployed to minimize unemployment in Kenya. Equity bank participation in enterprise development programs will not only enhance entrepreneur's skills but also improve its demand for financial support amongst SMEs who are in need for business expansion.

Finally, involvement in employee skills development programs will improve equity bank quality of work life and employees satisfaction. As stipulated by Maslow's hierarchy of needs there will be improved level of job satisfaction. This will amplify employees' gratification and enhance measures of improving corporate image.

5.2 Recommendations

From the study findings the following recommendations can be drawn; equity bank education programs should be diversified and look for more partnership. Through partnership equity bank will be better placed to serve more students who are mostly denied quality high school education due to lack of fees. To enhance whole life development there is need for education programs to have life skills support packages; this will enhance career planning and growth amongst high school and university students who are beneficiaries of equity bank education programs.

Since environmental protection programs have the capacity to improve corporate image. Equity bank should partner with government agencies such Kenya Wildlife Services (KWS), Kenya Forest Service (KFS) and schools so as to tree planting and environmental protection. Developing tree planting schemes in primary and high school would improve forest coverage. Equity bank should partner with ministry of education and initiate tree planting program countrywide. This will create its brand awareness and can ease recruitment of new account holders and also improve in levels of financial

inclusion amongst young children. Saving culture will be cultivated and consequently minimize poverty levels.

Thirdly, enterprise development programs should be customized so as to meet unique needs of their equity bank client base. Since, entrepreneurs could either be formally or informally trained, their training programs should be customized to address and breach financial, strategic and business development needs of their customers. Financial skills development would improve entrepreneur's development in financial acquisition and cash management strategy. Through strategic skills development entrepreneurs' would be better placed in understanding their clients' needs and consequently development products which would address their clients unique needs.

5.3Suggestions of Further Studies

Since the current study drew its respondent's commercial bank managerial positions, there is need for a similar study to draw respondents from its customers and examine influence of CSR on competitive advantage. The current study depended on 67 respondents there is need to increase the sample size. Since almost all banks engage in CSR activities there is need to carry out similar studies in respective banks and examine the influence of CSR on their competitive advantage. There are newly created financial institutions such as Savings and credit cooperative unions and micro finance banks there is need to examine their levels of involvement in CSR activities and they rely on it to achieve competitive advantage. The current study applied quantitative data, there is need for a similar study to adopt qualitative data or use mixed design. Structural equation modelling ought to be fitted so as to complement regression analysis.

Abstract
Commercial banks in Kenya operate in a dynamic environment characterized by technological changes, competition, regulatory requirements, economic changes and opportunistic strategic decisions. The stiff competition among the various players in the banking industry has lead the banks to look for more innovative ways of satisfying their stakeholders while at the same time making profits. Banks in Kenya have been involved in corporate social responsibility programs in the area of education and training, health, sustainable environment, sports and improving the livelihoods of vulnerable groups in society. Corporate Social Responsibility refers to operating a business in a manner that accounts for the social and environmental impact created by the business. As competition in the banking sector intensifies not only amongst themselves but from other competitors such as Micro Finance Institutions and Saccos, there is need to focus on other strategies to gain competitive advantage. The objectives of this study were; to determine the influence of education programs, environmental protection, and enterprise development and staff development programs as CSR activities on competitive advantage of Equity Bank Kenya Limited. The study was anchored on stakeholder's theory, strategic leadership theory and resource based view theory. The study used descriptive research design. The target population of this study comprised all the management staffs of equity bank in Kenya drawn from the head office in Nairobi who total to 145. Stratified sampling was used to draw 67 respondents. Primary data was collected using a semi structured questionnaire administered to staff using pick and drop method. Data was analysed using descriptive statistics, correlation and regression analysis. Results of the study revealed positive and significant relationship between education programs, environmental protection, enterprise development, staff development programs and equity bank competitive advantage.

Key words: Competitive advantage, corporate social responsibility, Equity Bank Kenya Limited.

Introduction
A competitive advantage is what makes an entity's goods or services superior to all of a customer's other choices. The term is commonly used for businesses. The strategies work for any organization, country, or individual in a competitive environment. (Kimberly Amado)
Competitive advantage is also how an organization will achieve its objectives in the face of competition from other organizations (Carroll & Shabana, 2010). In achieving this goal, an organization must perform better than other players in its industry must. In so doing, this could boil down to meeting the needs of the consumers more effectively and this could enable the service provider to command a higher price which can lead to increased revenues (Crowth & Aras, 2008). In achieving this goal an organization must perform better than other players in its industry.

If the company is cost effective, it can then be able to command a lower price in its offering to the consumers and this can lead to increased revenues (Thompson, 2010). However, a review of approaches for building competitive advantage illustrates that marketing plays a central role. A number of popular approaches include, strong market positions with products and services which are not easily substituted, entry barriers, strong bargaining position, mobility barriers, balanced portfolio`s, core competences, innovation and speed or time based competition. Multinational Companies (MNC`s) can promote the adoption of CSR practices as part of their strategy so as to increase their competitiveness within the economy and industry.

In competitive advantage, the current globalized world, competition has become a buzzword with regard to organizational performance and survival (Porter & Kramer, 2012). Research has established that firms, which are unable to attain or sustain greater organizational performance often, collapse (Palmer, 2012). Thompson (2010) this gives the customer a reason that lasts to prefer the company products to competitors. An organization derives its competitive advantage from either managing their costs or providing a unique offering to their market (Crowth & Aras, 2008).

According to Reverte (2009), he contends that to attain and sustain a competitive advantage, firms have to explore several alternatives including engagement in CSR strategies. According to Weber (2008), health strategy is a fundamentally effective means of attaining a competitive advantage in a competitive business milieu as individual beneficiaries of the health assistance and their relatives,

friends and acquaintances develop a feeling that they owe the firm a lot. As such, it is perceptible that a health strategy is a potentially effective way of attaining a competitive advantage.

Schwenker and Wulf (2013) have argued that increased involvement in certain CSR strategies result in the enhancement of organizational performance and competitive advantage (CA). Firms have also undertaken to increase their assistance to the health sector and the people in need of certain medical attention but lack proper resources and funds to realize such needs (Kariuki & Rotich, 2013). Hamori (2013) points out that sports strategy in CSR serves to establish a good corporation reputation, which in turn guarantees high performance by the employees. This give the firm a competitive advantage relative to its key competitors thereby allowing the firm to retain its exceeding its business performance (Harvard Business Review, 2011).

According to Westover (2010) CSR influences the rates of employee retention or employee turnover rates. Turnover is process in which employees leave the organization and have to be replaced. Turnover is related to employee motivation. Excessive turnover can be a very costly problem, one with a major impact on productivity. But cost is not the only reason turnover is important. Lengthy training times, interrupted schedules, additional overtime, mistakes and not having knowledgeable employees in place are some of the frustrations associated with excessive turnover (Westover, 2010). It has been observed that a health strategy facilitates employee motivation in fulfilling their tasks to the firm and therefore facilitate organizational performance.

1.2 Objectives of the Study

1.1.1General Objective

The main research objective was to establish the influence of Corporate Social Responsibility activities on competitive advantage of Equity Bank Kenya Limited.

1.1.2 Specific Objectives

The specific objectives of the study were to**;**

v. Establish the influence of education programs on competitive advantage of Equity Bank Kenya Limited.
vi. Examine the influence of environmental protection programs on competitive advantage of Equity Bank Kenya Limited.
vii. Determine the influence of enterprise development programs on competitive advantage of Equity Bank Kenya Limited.
viii. Establish the influence of staff development programs on competitive advantage of Equity Bank Kenya Limited

2.Theoretical Literature

2.1 Stakeholder Theory

This theory was proposed by (Freeman, 1984). Stakeholders theory states the purpose of the company as to provide return on investment for shareholders and thus corporations are seen as instruments of creating economic value for those who risk capital in the enterprise, (Greenwood, 2001). It is believed that the sole constituency of business management is the shareholders and the sole concern of shareholders is profit maximization. Any activity is justified if it increases the value of the firm to its shareholders and is not justified if the value of the firm is reduced, (Cochran, 1994). Corporate expenditure on social causes represents a violation of management responsibility to shareholders to the extent that the expenditure does not lead to higher shareholder wealth, (Ruf, 1998). In relation to shareholder theory, this implies that company managers are obliged to adhere to the objective of maximizing long-term owner value.

Stakeholder theory emerged as an alternative to shareholder theory, (Spence et al, 2001). According to Windsor (2001), the term stakeholder represents a softening of strict shareholder theory. It recognizes

the fact that most, if not all firms have a large and integrated set of stakeholders, (Cochran, 1994) to which they have an obligation and responsibility, (Spence *et al*, 2001). This theory challenges the view that shareholders have a privilege over other stakeholders, (Freeman & Reed, 1983). The stakeholder theory is a response to financial theories that assert that firms should focus only on maximizing the economic interests of shareholders, (Orts & Schulder, 2002). According to Kaler (2003), the stakeholder approach involves a basic reformist stance toward shareholder theory, seeking to move it in the direction of greater equity and a less single-minded concentration on owner's interests rather than replacing it entirely.

The theory's application to this study is premised on the backdrop that the Chief Executive Officer (CEO) of Equity Bank Limited as manager saw the need to satisfy a bigger chunk of the stakeholders and or clients by engaging in such activities as promoting and shaping the future of the younger generation by offering them the platform to curve their niche in leadership as well as in education. Through equity bank involvement in education programs they are able to train and equip young generation with skills which they can use to serve in their respective institutions. Indeed, through the work based programs for all education beneficiaries the bank will be better placed to equip and tap skills which the students have.

2.2 Strategic Leadership Theory

The theory of strategic leadership finds its roots from the evolution of management theory by (Fredrick, 1856). The essence of strategic leadership involves the capacity to learn, the capacity to change and managerial wisdom (Boal & Hooijberg, 2001). This theory highlights the functions of a leader and how they manage crisis and maintain proper organizational structures, processes and culture for purposes of gaining competitive advantage. The effort of a leader is therefore very essential in the organization of human capital, financial resource, organization structure and process to achieve a competitive stand in the market

Waldman *et al* (2004) applies strategic leadership theory to CSR and noted that companies run by intellectually stimulating CEOs do more strategic CSR than comparable firms. These authors affirm that certain aspects of transformational leadership will be positively correlated with the propensity of firms to engage in CSR and that these leaders will employ CSR activities strategically. A strategic leader displays a dissatisfaction or restlessness with the present; absorptive capacity. Beatty and Quinn (2010) define strategic leadership as a combined responsibility of the leader, the follower and the organization. Leadership presents challenges that call forth the best in people, and bring them together around a shared sense of purpose.

Strategic leadership includes determining the firm's strategic direction, aligning the firm's strategy with its culture, modelling and communicating high ethical standards, and initiating changes in the firm's strategy, when necessary. Strategic leadership sets the firm's direction by developing and communicating a vision of future and inspires organization members to move in that direction. Unlike strategic leadership, managerial leadership is generally concerned with the short-term, day-to-day activities, (Pearce & Robinson, 2007).

Equity Bank CEO provides strategic leadership to the organisations equity group foundation whose sole responsibility is social and economic transformation. With intentionality, alignment, and a higher purpose; the work between the leader and the followers can create a synergy. This makes the theory relevant based on the need for effective management and leadership for CSR activities carried out in equity bank Kenya. The theory is appropriate for the study since equity bank has endeavoured to support skills for its employees as well as beneficiaries of equity foundation from whom they can attract and recruit them to serve in their respective bank as well as equity foundation.

2.3 Resource Based View theory

This theory was first proposed by (Edith Penrose's 1959**)**. The resource-based view of the firm (RBV) draws attention to the firm's internal environment as a driver for competitive advantage and emphasizes the resources that firms have developed to compete in the environment. Ultimately, firms that are able to leverage resources to implement a value creating strategy not simultaneously being implemented by any current or potential competitor can achieve competitive advantage, (Barney, 1991). The RBV as a basis for the competitive advantage of a firm lies primarily in the application of a bundle of valuable tangible or intangible resources at the firm's disposal, (Mwailu & Mercer, 1983).

Moreover, Hart (1995) was the first to apply the RBV framework to corporate social responsibility. The study focussed exclusively on environmental social responsibility and asserted that, for certain types of firms, environmental social responsibility can constitute a resource or capability that leads to a sustained competitive advantage.

The RBV has put forward a number of assumptions that may be useful in the management of organizations: Resource Heterogeneity is the first assumption which states that the resources that organizations possess differ from one company to another. If organizations would have the same amount and mix of resources, they could not employ different strategies to outcompete each other therefore RBV assumes that companies achieve competitive advantage by using their different bundles of resources. The second assumption of RBV is that resources are not mobile and do not move from company to company, especially in short-run. Due to this immobility, companies cannot replicate rivals' resources and implement the same strategies. This is truer with the intangible resources, such as brand equity, processes, knowledge or intellectual property that are usually immobile, (Hooley & Greenlay, 2005).

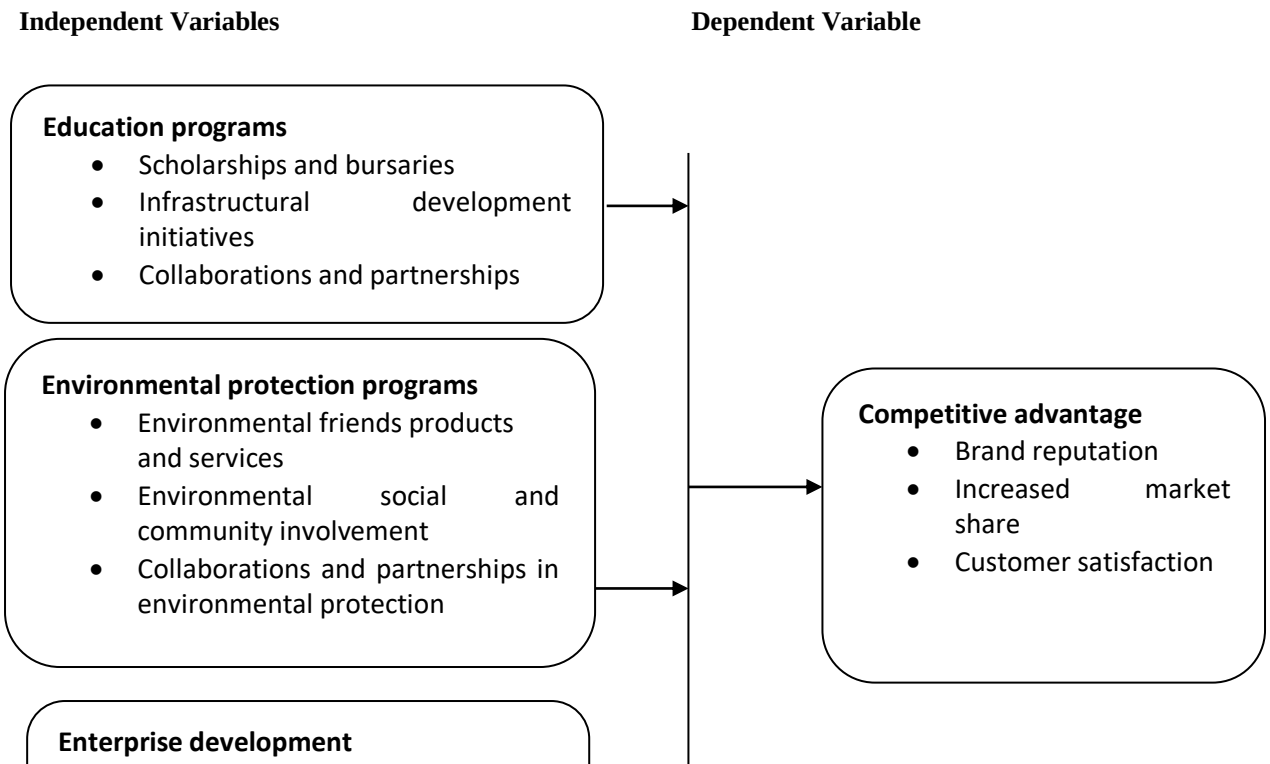
Barney (1991) proposed the VRIN framework that examines if resources are valuable, rare, costly to imitate and non-substitutable. The resources and capabilities that answer yes to all the questions are the ones that lead to sustained competitive advantages. Resources are valuable if they help organizations to increase the value offered to the customers. This is done by increasing differentiation or/and decreasing the costs of production. Resources that can only be acquired by one or few companies are considered rare. A company that has valuable and rare resource can achieve at least temporary competitive advantage. However, the resource must also be costly to imitate or to substitute for a rival, if a company wants to achieve sustained competitive advantage.

McWilliams and Siegel (2001) outlined a simple model in which two companies produce identical products, except that one firm adds an additional social attribute to the product, which is valued by some consumers and other stakeholders. In this model, managers conduct a cost/benefit analysis to determine the level of resources to devote to CSR activities by assessing the demand for CSR and evaluating the cost of satisfying the demand.

The theory is appropriate since through creation of conducive environment the bank will be able to operate optimally. Indeed, participation in environmental conservation strategies will act as an avenue to educate not only environmental issues but also a platform to promote equity product awareness. Also the theory supports enhancement of employee satisfaction through creation of cohesive programs which will promote skills development and health fitness by organizing health and sport related activities

2.4 Conceptual Framework

The dependent variable in this study was competitive advantage while the independent variable was corporate Social responsibility



3. Research Methodology

3.1 Research Design

The study adopted descriptive and cross-sectional research design which Mugenda and Mugenda (2003) posits that it is a systematic, empirical inquiring into which the researcher does not have a direct control of independent variable as their manifestation has already occurred or because the inherently cannot be manipulated. Research design ensures the study is applicable to the problem and its procedures are cost-effective for obtaining information. Descriptive research design is concerned with finding out about the how, who, when and where of a phenomenon so as to build a profile (Mugenda & Mugenda, 2003). The design was appropriate since the current study investigated corporate social responsibility on competitive advantage in Equity bank limited.

3.2 Target Population.

A population is a well-defined or set of people, services, elements, and events, group of things or households that are being investigated. The target population for study was all 145 management employees at Equity Bank Kenya Limited head office in Nairobi. These employees were categorised into 20 top level, 30 middle level and 95 in the functional level.

Table 3.1: Target Population

Category	Population size	Percentage
Top Level	20	13.8
Middle Level	30	20.7
Lower Level	95	65.5
Total	**145**	**100**

Source: Author (2017)

3.3 Sampling Size and Sampling Technique

Simple random sampling technique was used to obtain a representative sample since population of interest is homogeneous. Simple random sampling will be adopted to select 67 respondents who will be distributed in the three levels of management using stratified sampling technique. Out of 67, 9 will be drawn from top level management, 14 from middle level management and 44 from functional level. To give all respondents an equal chance of consideration simple random sampling will be used. A sample of 67 was calculated as follows according to Kothari (2011):

$$n = \frac{Z^2pq}{d^2}$$

Where:
n = sample size, N= entire Population, Z= level of significance (1.96 confidence level)

d= Expected Error, p = Probability of success, q = Probability of failure

As such the sample for this study can be derived as follows:

$$n = \frac{1.96^2 * 0.5 * 0.5}{0.12^2} = 67$$

Table 3.2: Sample Size

Category	Percentage	Sample Size
Top Level	13.8	9
Middle Level	20.7	14
Functional Level	65.5	44
Total	**100**	**67**

Source: Author (2017)

3.4 Data Collection Instrument

Primary data was collected by the help of a semi structured questionnaire. The close-ended questions provided more structured responses to facilitate tangible recommendations while the open-ended questions provided additional information that was be captured in the close-ended questions. The study used both primary and secondary data. Secondary data was collected from the records of the Equity Bank Foundation which is the CSR arm of the Equity group of companies. The CSR records showed the project undertaken and also the competitive performance information was indicated from the financial statements of the bank.

3.5 Validity and Reliability of the Study

3.5.1 Validity of the Study

Cooper and Schindler (2010) indicated that a pilot test is conducted to detect weaknesses in design and instrumentation and to provide proxy data for selection of a probability sample. According to Babbie (2004), a pilot study is conducted when a questionnaire is given to just a few people with an intention of pre-testing the questions. Pilot test is an activity that assists the research in determining if there are flaws, limitations, or other weaknesses within the interview design and allows him or her to make necessary revisions prior to the implementation of the study (Kvale, 2007). To establish the reliability and validity of the research instrument the study sought opinions of experts in the field of study especially the study's supervisor and lecturers in the school of business administration and strategic management. This facilitated the necessary revision and modification of the research instrument thereby enhancing validity.

Validity is a measure of the degree to which data obtained from the instrument accurately and meaningfully represents the theoretical concept and in particular how the data represents the variables. Where validity has been established, any inferences made from such data was accurate and meaningful (Mugenda & Mugenda, 2003). The first phase of this research employed the econometric technique to establish the relationship between corporate social responsibility strategies and performance of commercial banks in Kenya with a special focus on Equity Bank Limited. The data was collected from the organizations' departments such as human resource, IT, finance, operations, marketing and strategic management. This confirmed the validity of the data and relevant results.

3.5.2 Reliability of the Study

Cronbach's Alpha was applied to measure the co-efficient of internal consistency and therefore reliability of the instrument. In order to check reliability of the results, the study used Cronbach's alpha methodology, which is based on internal consistency. Cronbach's alpha measures the average of measurable items and its correlation. Overall scales' reliability of the present situation and the desirable situation were tested by Cronbach's alpha, which should be above the acceptable level of 0.70 (George & Mallery, 2003).

3.6 Data collection Procedure

Upon successful presentation of the research proposal, an introduction was sought from Kenyatta University School of graduate studies and it was presented to the National Commission for Science, Technology and Innovation (NACOSTI) to seek research permit.

4. Findings.

4.1 Response Rate

Although, the study had a sample of 67 respondents only 56 questionnaires were returned and correctly filled, this yielded 84%. According, to Kothari (2011) the response was appropriate because it was greater than 70%.

Table 4.1: Response Rate

Questionnaire	Frequency	Percentage
Returned	56	84
Non returned	11	16
Total	**67**	**100**

Source (Author, 2018)

4.2 Bank Engagement in Corporate Social Responsibility

The study investigated types of corporate social responsibilities equity bank engaged in. As shown in Table 4.5 most of the respondents reported that to great extent equity bank was involved in CSR activities (mean = 4.2, standard deviation = 0.9). Most of the respondents, 53.6% reported that to very great extent equity banks was involved in education and training programs, 50% reported to great extent equity bank was involved in environmental protection programs. Further, 42.9% reported that equity bank was involved in enterprise development initiatives, and 51.8% reported that to very great extent equity bank was involved in staff benefits enhancement.

Table 4.2: Bank Engagement in Corporate Social Responsibility

	Percentage (n=56)						
	Not at all	**Little extent**	**Moderate extent**	**Great extent**	**Very great extent**	**Mean**	**Std. Dev**
Education and training programs	0	3.6	5.4	37.5	53.6	4.4	0.8
Environmental protection programs	1.8	3.6	25	50	19.6	3.8	0.9
Enterprise development initiatives	1.8	3.6	16.1	42.9	35.7	4.1	0.9
Staff benefits enhancement	1.8	3.6	7.1	35.7	51.8	4.3	0.9
Overall average						**4.2**	**0.9**

Source (Author, 2018)

4.3 Competitive Advantage

Further, the study sought respondents' opinion in regard to competitive advantage upon equity banks participation in CSR. On a five point Likert scale most of the respondents reported that to very great extent equity bank participation in CSR had influence on its competitive advantage (mean = 4.5, standard deviation = 0.7). This was accounted for in recruitment of new customers (mean = 4.2), new investors local and foreign (mean = 4.4), employee satisfaction (mean = 4.4), brand appeal and association (mean = 4.5), entry into new markets (mean = 4.6) and accomplishment of strategic plans (mean = 4.7).

Table 4.3: Competitive Advantage

	Percentage (n=56)						
	Very low	**Low**	**Average**	**High**	**Very High**	**Mean**	**Std. Dev**
Recruitment of new customers	3.6	1.8	12.5	33.9	48.2	4.2	1.0
New investors local and foreign	1.8	1.8	7.1	35.7	53.6	4.4	0.8
Employee Satisfaction	1.8	0	7.1	37.5	53.6	4.4	0.8

5. Conclusion and further research

5.1 Conclusion

Based on the study findings the following conclusions can be drawn. CSR had significant influence on equity bank competitive advantage and accounted for 80% of its competitive advantage. Therefore, there is need for equity bank to amplify its participation in CSR activities more so in education and training programs, environmental protection programs, enterprise development programs and staff development programs.

Owing to success rates in equity banks wings to fly education programs, there is need for a diversified education program to be developed. Since the current program is skewed towards academic achievement, there should develop a program geared towards recognizing and rewarding outstaying talents. Through this participation in co curriculum activities will be enhanced and can aid in breaching of unemployment gaps.

Secondly, there is need for corporate organization participation in environment protection programs. Although, these programs may be expensive they may be avenues through which corporation can enhance its market penetration. Indeed, involvement of equity bank in tree planting and forest protection programs will not only portray them as environmentalist but also improve their brand association with current desire to alienate current threats.

Thirdly, entrepreneurship is the main yardstick which can be deployed to minimize unemployment in Kenya. Equity bank participation in enterprise development programs will not only enhance entrepreneur's skills but also improve its demand for financial support amongst SMEs who are in need for business expansion.

Finally, involvement in employee skills development programs will improve equity bank quality of work life and employees satisfaction. As stipulated by Maslow's hierarchy of needs there will be improved level of job satisfaction. This will amplify employees' gratification and enhance measures of improving corporate image.

5.2 Recommendations

From the study findings the following recommendations can be drawn; equity bank education programs should be diversified and look for more partnership. Through partnership equity bank will be better placed to serve more students who are mostly denied quality high school education due to lack of fees. To enhance whole life development there is need for education programs to have life skills support packages; this will enhance career planning and growth amongst high school and university students who are beneficiaries of equity bank education programs.

Since environmental protection programs have the capacity to improve corporate image. Equity bank should partner with government agencies such Kenya Wildlife Services (KWS), Kenya Forest Service (KFS) and schools so as to tree planting and environmental protection. Developing tree planting schemes in primary and high school would improve forest coverage. Equity bank should partner with ministry of education and initiate tree planting program countrywide. This will create its brand awareness and can ease recruitment of new account holders and also improve in levels of financial inclusion amongst young children. Saving culture will be cultivated and consequently minimize poverty levels.

Thirdly, enterprise development programs should be customized so as to meet unique needs of their equity bank client base. Since, entrepreneurs could either be formally or informally trained, their training programs should be customized to address and breach financial, strategic and business development needs of their customers. Financial skills development would improve entrepreneur's development in financial acquisition and cash management strategy. Through strategic skills development entrepreneurs' would be better placed in understanding their clients' needs and consequently development products which would address their clients unique needs.

5.3Suggestions of Further Studies

Since the current study drew its respondent's commercial bank managerial positions, there is need for a similar study to draw respondents from its customers and examine influence of CSR on competitive advantage. The current study depended on 67 respondents there is need to increase the sample size. Since almost all banks engage in CSR activities there is need to carry out similar studies in respective banks and examine the influence of CSR on their competitive advantage. There are newly created financial institutions such as Savings and credit cooperative unions and micro finance banks there is need to examine their levels of involvement in CSR activities and they rely on it to achieve competitive advantage. The current study applied quantitative data, there is need for a similar study to adopt qualitative data or use mixed design. Structural equation modelling ought to be fitted so as to complement regression analysis.

Abstract

The aim of this study was to investigate the influence of marketing strategies on the performance of Kenya Airways. A primary research methodology was adopted using questionnaires as instruments of data collection. The case structured questionnaires were distributed to employees, managers and directors of Kenya Airways in Nairobi Headquarters. Using a simple random sampling technique, a sample of 100 respondents were selected to participate in the study. Data collected was coded and entered into Statistical Package for Social Sciences (SPSS). Quantitative results were generated in form of descriptive statistics (frequencies, proportions, and standard deviations) and inferential statistics (regressions). A multiple regression model was used to test the relationship between independent and dependent variables. Further, the regression results included ANOVA and coefficient of variables respectively at 95% confidence level. Results obtained showed that marketing strategies have a positive and significant influence on performance in an organization. It was recommended that that the Kenya Airways management should implement suitable marketing strategies that can attract and maintain customers in order to improve company performance. Future studies should focus on a wider scope and in order to validate the findings from this study.

Key words: marketing strategies, performance, Kenya Airways, management.

Introduction

Background

The ever-increasing competition in modern markets inspire companies to implement various performance improvement strategies. The frequency of poor performance in organizations has increased in the recent past, and unless steps are taken to address it, the severity of decline worsens to the point of financial distress where the firm is unable to satisfy its monetary obligations. One approach of addressing organizational non-performance is implementation of strong turnaround strategies particularly those oriented to marketing activities (Brooks, Weatherson and Wilknson, 2010). To determine if performance is improving or not improving, Brooks *et al.* (2010) recommend that business organizations ought to execute performance measurement. A number of metrics can be used by organizations to measure their performance. Such approaches include but they are not limited to the following; using balanced score cards, using financial forecasts and budgets for financial indicators and variance analysis, and employing strategic metrics as well as operational metrics especially for non-financial indicators among others (Inyange, 2014).

Performance management is a crucial aspect in modern businesses. Its centrality is founded on the observation that it determines the overall growth of an organization. Mutegi (2017a) strongly believes that performance management is usually perceived as the metrics under which an organization's overall growth can be assessed. Companies have a wide array of strategies of improving performance that they can select implement. One of the categories of these strategies is turnaround strategies. Turnaround

strategies refer to those efforts and options organizations can explore to improve their performance and ensure that the results obtain depict their anticipations and goals respectively. Managers at various departmental levels such as marketing, human resource management, financial departments, production, and public relations among others are on the run to ensure that the strategic decisions made by entities more importantly at departmental levels are not only supporting the overall goal of an organization, but also improving performance in order to keep up with the pace of competition as well as market trends (Brooks *et al*., 2010). Types of turnaround strategies frequently used in the contemporary business world include competitive strategies, marketing strategies, human resource strategies, and financial strategies. However, most scholars and practitioners give attention to marketing strategies in the endeavours of performance improvement (Dann & Dann, 2011; Dicke, 2016; Charles & Anderson, 2016; Fraser & Hite, 2010).

Marketing strategies include aspects such as diversity marketing, relationship marketing, search engines use, and celebrity endorsement and increasingly becoming common in the modern business environment. Diversity marketing encompasses the adoption of various strategies which are used collectively to build on each other (Rogers, 2011; Hassan, Ullah, Sharif & Mukhtar, 2013). Moreover, relationship marketing was first defined as a form of marketing developed from direct response marketing campaigns which emphasizes customer retention and satisfaction, rather than a focus on sales transactions. Relationship marketing differs from other forms of marketing in that it recognizes the long term value of customer relationships and extends communication beyond intrusive advertising and sales promotional messages. With the growth of the internet and mobile platforms, relationship marketing has continued to evolve as technology opens more collaborative and social communication channels. This includes tools for managing relationships with customers that go beyond demographic and customer service data. Relationship marketing extends to include inbound marketing efforts, (a combination of search optimization and strategic content), PR, social media and application development. A part from relationship marketing, other forms of marketing strategies that are important in airline industry include search engine optimisation and celebrity endorsement respectively (Inyange, 2014; Hill, 2013).

Problem

The airline industry has been under immense pressure over the past few years with regards to performance. Kenya Airways for instance has recorded losses for the last two consecutive years something which has not gone down well with a number of stakeholders in the industry (Kimotho, 2016). KQ's financial results for the financial year 2015/16 were one of the worst for its historical performances (Aglionby, 2016). The publication cited that the airline reported a net loss of Kshs. 26.2bn ($258m) for 2015-16, up from Kshs. 25.7bn in the previous financial year, as its results were hit by a series of one-off items including charges linked to a poor fuel hedging policy. Empirical studies have indicated that a company's future can be improved by adopting turnaround strategies (Rogers, 2011; Nderu, 2014; Mutegi, 2017b). However, research on how marketing strategies can improve performance of Kenya Airways is still inadequate. Due to existing gaps from previous studies on the impact of marketing strategies on performance, the current study will seek to explore how these strategies have benefited or not benefited Kenya Airways owing to its continued loss making as complained by shareholders and other stakeholders.

Aim

The general objective for this study is to investigate the turnaround strategies and performance in Kenya Airways.

Objectives

To investigate the influence of marketing strategies on performance of Kenya Airways.

Significance

The study will be of great importance to various stakeholders such as the management of Kenya Airways, the employees in Kenya Airways, the Government of Kenya and other shareholders, and the

academicians respectively. The management of Kenya Airways will be able to benefit from this research because they will be able to understand the specific marketing strategies that they can implement to improve performance of the organization.

Literature Review

Theoretical Review

This study was anchored on the marketing theory. Marketing is a broad field with a number of models or theories that can be grouped together to explain the basic concepts behind marketing. The theory of marketing is founded on the premises of the philosophies that firms or companies utilize in turning around their performance strategies (Hunt, 2015). The philosophies are commonly referred to as the P's of marketing and they include product, price, promotion and price among others (Palmer, 2012). These philosophies are collectively referred to as marketing mix. A part from the marketing mix, marketing theory involves other strategies such as; channel marketing and viral marketing respectively (Dann and Dann, 2011). All these strategies are important because they collectively shape marketing theory and firms can utilize them in enhancing performance irrespective of the industry in which they belong, as opposed to those theories such as mass marketing that are industry specific depending on the nature of products and services being offered.

Firstly, the marketing mix strategy encourages organizations to consider factors that can directly or indirectly influence their business (Charles and Anderson, 2016). For example, it is important for a company to consider price in reference to their competitors as to whether it is reasonable, affordable and competitive. Secondly, place in which services and marketing efforts are carried out should be strategic in the sense that sales can be closed (Palmer, 2012). Using promotion serves to attract customers both existing and potential ones in order to achieve revenues targets. Additionally, the nature of product or service offered to the market should be of high-quality in order to be able to satisfy customer needs (Charles and Anderson, 2016).

Secondly, "a basic marketing theory states that to maximize sales, a company must position its products or services in the marketplace in such a way that consumers believe they need a particular product for service or that a product or service they need has a particular benefit" (Dicke, 2016). This concept can be explained adequately using the channel marketing concept in the sense that where an organization such as KQ markets its services should be strategic with potential customer leads. Thirdly, the concept of viral marketing is based on a recent development in marketing theory and centers around the effects of technology on marketing products (Charles and Anderson, 2016). It involves the use of social marketing as a way of communicating in marketing using platforms such as emails, Twitter accounts, Facebook pages, and any other electronic or internet enabled platforms to reach customers.

Generally, the theory of marketing is important to this study since the main focus is to identify turnaround strategies that Kenya Airways can use to ensure that they improve performance that has been for a long time of a greater concern and worry to different stakeholders. For example, they can position their marketing strategies, charge reasonable prices as opposed to charging expensive tickets as already revealed in background of study, identify the specific areas they can target (place) in order to realize profits, and promote their services to target market respectively (Dicke, 2016). Further, the company can adopt both viral marketing and channel marketing concepts to improve their marketing activities. In this regard, the theories or philosophies in marketing are relevant to objectives such as marketing and competitive strategies. Therefore, the theory supports the variable of marketing strategies and it is relevant to the current study as it offers a foundation for investigating the approaches currently used by KQ.

Empirical Review

Financial strategies in organizational performance are considered as one of the key strategic approaches that can be utilized to help an organization turnaround its performance (Rhyne, 2013). It is important however, to appreciate the fact that they cannot be pursued in isolation if effective results must be achieved. Strategy implementation involves organization of the firm's resources and motivation of the staff to achieve objectives (Muchira, 2013). Primarily, these assertions complicate management and

implementation of financial strategies owing to the nature in which there is an overall intertwining of the organizational approaches. In a more simplistic manner, Rhyne (2013) states that financial strategies cannot be relied upon in isolation. On the other hand, Muchira (2013) also states that implementation of any strategy involves both personnel and financial resources. In this case, it is evident that the main assumption from this statements is that implementation of any strategy in an organization must have an element of financial resources.

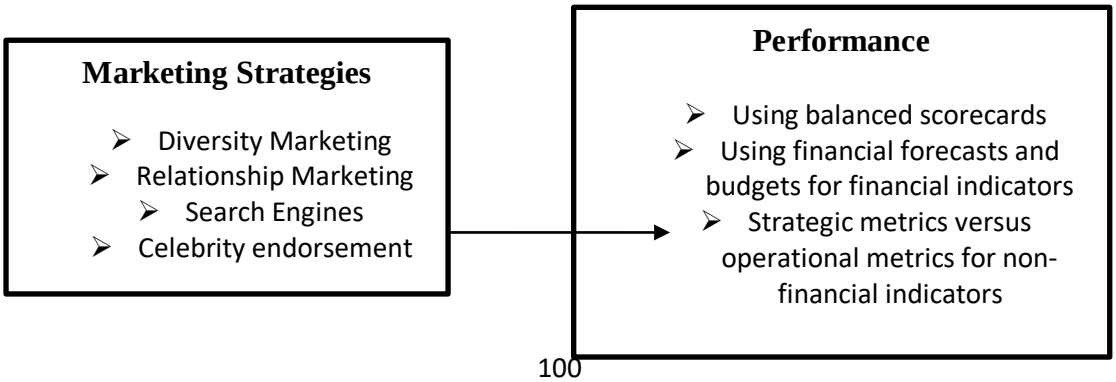
Similarly, a study was carried out by Namada, Aosa, Awino and Wainaina (2014) on "management participation and firm performance". Although the study was founded on the premise of management as an overall area of concern, it came out clear from the study's findings that organizational participation is very critical in ensuring that results are achieve. Namada and his colleagues clearly demonstrate that while considering different strategies for performance improvement, there is an integration of all departments in an organization from a management perspective. However, the most critical of all the departments is the financial department. It is important to acknowledge the fact that as all other strategies are pursued by incorporating financial section, the overall assumption is that they are all considered financial strategy in nature in one way or the other although not in a direct manner.

Firm performance is basically a strategic planning function, while financial planning is one of the main strategic decisions in an organization. Arasa and Obonyo (2012) explored a qualitative research in identifying the "relationship between strategic planning and firm performance". They observed that strategic planning encompasses a number of decisions key of which is financial resources allocation and distribution, as well as fundraising. Critically, this relationship demonstrates that for all other strategic decisions to be implemented there is an inevitable element of budgeting, in which case an organization must satisfy the measures to be taken to raise sufficient funds and how these funds should be allocated among competing needs in an organization.

Although not trying to present financial strategies as superior to other strategies, it is important to impact and role financial decisions have in the overall organizational performance. Isaksson and Lantz (2015) too share the same sentiments in their publication on "outsourcing strategies and their impact on financial performance". The authors, who had initially targeted to investigate outsourcing effectiveness in small organizations, ended up drawing an important line of literature that can be used in this study. Precisely, they noted that outsourcing in any manner is a move towards helping an organization utilizes its resources from a financial perspective. For instance, by outsourcing, a firm is able to minimize costs as opposed to having full time commitment. This can be linked to leasing from out assets and aircrafts in the case of airline industry. However, organizations must be strategic in identifying areas that can be outsourced and those that should not while focusing on maximization of returns from a financial perspective.

Waweru and Ngugi (2014) investigated the influence of "financial management practices on the performance of small and micro enterprises in Kenya". In their study, they observed that knowledge on financial management is one of the strategies to help entities improve performance hence promoting economic growth in an economy. An exploratory study by Capon and Farley (2014) also contributed that strategic planning helps firms to ensure that financial decisions are made in a manner that help firm maximize their returns. In overall, the two studies have shown that financial strategies cannot be overlooked as they are as important as any other strategies, but more importantly very critical in determining general performance.

Conceptual Framework



(Figure 1: Conceptual framework)

Methodology

Descriptive design is suitable is it enables the researcher to answer questions such as how, what, when, which, where, who among others (Creswell, 2014).

For this research, the target population comprised directors, senior management, head of departments and staff/employees of Kenya Airways in Nairobi headquarters distributed across various groups as presented in table 3.1 below.

Table: 1 Target Population

Level	*Number*	*Percentage of target population*
Directors	10	2.50
Senior Management	20	5.00
Head of Departments	30	7.50
Employees	340	85.00
Total	400	100.00

The researcher employed a sampling formula as proposed by Kothari (2014) to select a sample size which is represented in the sampling frame table 2 below.

$n=N/1+N(e)^2$……(i)

Where;

N = Population Size, n = sample size, and e = is the level of precision which is 0.05 in this case for a 95% confidence level. Because of time and financial constraints, the above formulae will be adjusted by dividing it by 2 based on the researcher's judgement, provided the overall sample size will be above 20% as recommended by Kothari (2014).

Hence; the sample size will be given by; N = 400, e = 0.05

Calculated as; $\{400 / [1+400(0.05)^2]\}/ 2$

= 100

Sample size of 100 respondents is 25% of the target population distributed in different groups as in the sampling frame table 3.2 below.

Table 2: Sampling Frame

Level	**Initial population size**	**Calculated Sample Size using 25%**
Directors	10	2
Senior Management	20	5
Head of Departments	30	8
Supervisors	340	85
Total	400	100

Structured questionnaire containing both closed ended and open ended questions were used to collect data. Majority of the questions were closed-ended so as to encourage the respondents to give feedback as because it required them to tick from among the provided options. The researcher then administered

the questionnaires with the interview questions face to face and allow the respondents to fill in their responses after seeking permission from the entity's management. The questions were classified into sections with regard to background information and the four objectives envisaged in this research.

Reliability was determined based on internal reliability which is basically on the internal consistency of the constructs or items used and this will be measured by the use of Cronbach's Alpha test (alpha value should be at least 0.7). The researcher ensured the questionnaires met the requirements of content validity. This involved basically examining the content of data collection instruments to establish if they are valid.

Data collected using questionnaires was cleaned, organized, sorted and analyzed using Statistical Package for Social Sciences (SPSS) and the results will subsequently be presented using tables and figures respectively. The to be obtained will be used to present the entire interpretation in a regression model that will show the relationship of the dependent variable with independent variables in an equation as presented below;

$$Y = B_O + B_2X_2 + e$$

Where:

Y = Dependent Variable; B_0 = a constant coefficient (if any); B_2 = Coefficient of marketing strategies; X_2 = Marketing strategies; e = is an error time respectively.

The researcher ensured confidentiality of personal information of the respondents that may take part in the study. The researcher also ensured informed consent and data safety during the whole process of data collection, analysis and interpretation.

Findings

Response rate and Reliability

This section presents findings from the study that achieved a 92% response rate. The questionnaire items regarding marketing strategies was 0.747 as shown in table 3 below.

Table 3: Cronbach's Alpha Test for Independent Variables

Independent Variables	Number of items	Cronbach's Alpha
Marketing Strategies	17	0.747

The table above shows the Cronbach's Alpha value for the variable marketing strategies is 0.747, which are sufficient to conclude that there is data reliability since are above the recommended value of 0.7.

Demographic Characteristics

The study analysed demographic characteristics of the respondents and presented findings using table 4 below.

Table 4: Demographic characteristics

	Variable	**Characteristic**	**Frequency**	**Proportion**
1	Age	Below 20 years	20	21.7%

		21 - 30 years	21	22.8%
		31 - 40 years	14	15.2%
		41 - 50 years	22	23.9%
		Above 51 years	15	16.3%
		Total	92	100.0%
2	Gender	Male	49	53.3%
		Female	43	46.7%
		Total	92	100.0%
3	Level of education	Diploma	21	22.8%
		Bachelors	29	31.5%
		Masters	21	22.8%
		PhD	21	22.8%
		Total	92	100.0%
4	Department	Director	4	4.3%
		Senior manager	15	16.3%
		Head of department	20	21.7%
		Junior employee	53	57.6%
		Total	92	100.0%
		Below 1 year	6	6.6%
		Between 1 - 2 years	17	18.7%
		Between 3 - 4 years	15	16.5%
		Between 5 - 6 years	12	13.2%
		Between 7 - 8 years	13	14.3%
		Between 9 - 10 years	11	12.1%
		Above 11 years	17	18.7%
		Total	91	100.0%

Majority of the respondents were males (53.3%) aged 41-50 years (23.9%) with an undergraduate degree (31.5%), working as junior employees (57.6%) and having worked with Kenya Airways for a period of 1-3 years.

Marketing strategies influence on Performance of Kenya Airways

The objective of this study was to investigate the influence of marketing strategies on performance of Kenya Airways. The respondents were subjected to a series of questions that were meant to determine their opinions on marketing strategies. The responses obtained have been analysed and presented in the sections that follow.

The respondents were asked to indicate the extent to which they agree with the given set of statements related to marketing strategies. They were required to indicate if they strongly disagree, disagree, neutral, agree or strongly agree.

Table 5: Extent to Agreement of Statements on Marketing Strategies

Statements	Strongly Disagree (%)	Disagree (%)	Neutral (%)	Agree (%)	Strongly Agree (%)	Mean
KQ focuses on customer satisfaction in all its services	5.4	5.4	4.3	42.4	42.4	4.11
No need to advertise since KQ is a big firm	1.1	1.1	7.6	44.6	45.7	4.33

Marketing can help KQ to turnaround poor performance	5.4	5.4	4.3	44.6	40.2	4.09
Marketing employed not strategic in the market	2.2	4.3	4.3	60.9	28.3	4.09

Source: (Survey Data, 2018)

Hassan et al. (2013), in their study reputed that marketing strategies are paramount turnaround strategies that any organization should embrace. The study findings revealed the respondents applauded the focus on customer satisfaction, n need to advertise since KQ was a big firm, marketing can help KQ to turnaround poor performance and marketing employed not strategic in the market since they had an average of above 4 as shown in the table 4.12 above. The findings contradict a study by Jaakkola (2011) who established that there was need for advertisement and strategic marketing despite the size of the firm. Moreover, the percentages of the four statements imply that the respondents were satisfied with marketing strategies embraced by the Kenya Airways.

The respondents were asked to express their opinions on whether the marketing strategy was an effective strategy to help an organization turnaround its performance.

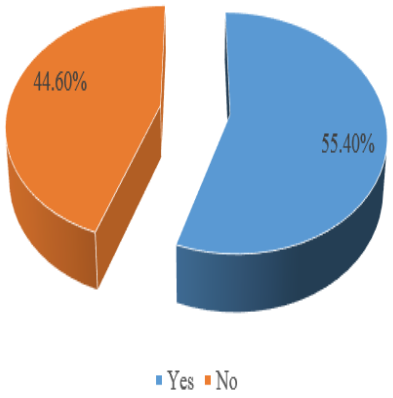


Figure 2: Marketing is an Effective Turnaround Strategy

The responses indicated that 55.4% of the respondents said yes while 44.6% said no as shown in the figure 4.5 above. The findings implied that marketing dimension of any company influenced its turnover. According to Ogbu (2016), effective marketing strategies resulted to a huge market share, increased number of customers and boosted reputation of the firm thus boosting sales revenue and improved performance of the firm. Additionally, the findings were echoed by Lucio and Noci (2010) who found out that marketing had great impact on the turnaround strategies and the performance of the firm.

The findings of the study on the extent to which marketing as an effective strategy to help an organization turnaround its performance indicated that 38% of the respondents said it was small extent, 37% said it was a large extent and finally 25% of the respondents said it was moderate extent as shown in the figure 4.6 below.

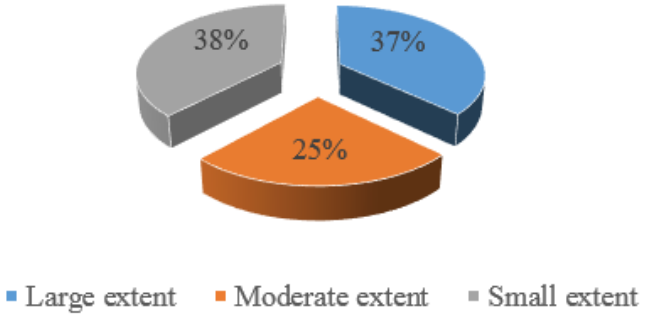

Figure 3: Extent of Marketing as a Turnaround Strategy

The respondents were asked their opinions on which marketing strategies they thought were important to Kenya Airways.

Table 6: Marketing Strategy Important To Kenya Airways

Important	Frequency	Percentage
Diversity marketing	19	20.7%
Transactional marketing	17	18.5%
Social media marketing	16	17.4%
Celebrity endorsement	12	13.0%
Relationship marketing	14	15.2%
Others	14	15.2%
Total	92	100.0%

Source: (Survey Data, 2018)

The responses obtained revealed that 20.7% of the respondents believed diversity marketing was the most important, 18.5% agitated for transactional marketing, 17.4% proposed the social media marketing, the respondents who chose relationship marketing and other marketing strategies were represented by 15.2% each. Also, the respondents who were for celebrity endorsement were represented by 13% as displayed in the table 4.183 above. The findings agree with the study by Russow and Okoroafo (2013) who enumerated transactional marketing, social media marketing, celebrity endorsement and relationship marketing as the most important marketing strategies to boost performance of a firm. They further argued that the strategies were essential turnaround strategies to transform poor performance of any firm.

Relationship between marketing strategies and performance of Kenya Airways

The regression analysis found an R-square of 0.696 (R^2=0.696) as shown in table 7 below.

Table 7: Model summary

R	R Square	Adjusted R Square	Std. Error of the Estimate
.392[a]	.696	.657	.57249

This implies that the independent variable (marketing strategies) explain about 69.6% of the changes in the dependent variable (performance) when all other factors are held constant. Further, a value of 0.657 implies 65.7% of the changes in the dependent variable are explained by the independent variables ceteris paribus when adjusted for the degrees of freedom.

Analysis of variance revealed that the model was significant in predicting the relationship between the independent and dependent variables due to its p-value of 0.005 ($p<0.05$).

Table 8: The ANOVA Table

Model	Sum of Squares	Df	Mean Square	F	Sig.
Regression	5.171	4	1.293	3.945	.005
Residual	28.514	87	.328		
Total	33.685	91			

The coefficient of marketing strategies was found to be 0.454 with a significant level of 0.00 as shown in table 9 below.

Table 9: A Table for Regression Coefficients

Model	**B**	**Std. Error**	**Beta**	**t**	**Sig.**
(Constant)	3.755	.428		8.772	.000
Marketing strategies	.454	.120	.534	3.778	.000

The complete regression model is given by the equation below;

$Y = 3.755 + 0.454\ X_3 + 0.57249$…….(ii)

At 95% significance level, the marketing strategies are found to have a significant positive relationship with the performance of a firm (Fraser and Hite, 2010). The sig. value 0.000 which is less than alpha value of 0.05. This indicates that a unit increase in marketing strategies leads to 0.454 increase in the level of performance of Kenya Airways.

Conclusions

This study aimed at investigating the effect of marketing strategies on the performance of Kenya Airways, owing to its failed expansion strategy. Findings from the study revealed that Kenya Airways did not focus on customer satisfaction in all its services. Failure to focus on customer satisfaction is against the basic marketing theory that states to maximize sales, a company must position its products or services in the market place in such a way that consumers believe they need a particular product for service or that a product or service they need has a particular benefit. It was also noted that the management saw the need to advertise despite Kenya Airways being a big firm hence boosting the public image and reputation. The design of the marketing strategy highly influenced the performance as

turnaround strategy. In addition, marketing strategy was regarded as an effective strategy to help an organization turnaround its performance. The respondents enumerated diversity marketing, transactional marketing, social media marketing, relationship marketing and celebrity endorsement as the main elements of marketing most important to Kenya Airways in its turnaround strategies and improvement of performance. Further, the findings of the study established that there is a positive and significant relationship between the marketing strategies and the performance of a firm.

The study results were used to conclude that marketing strategies are key in improving the performance of Kenya Airways. Marketing should entail creativity while designing the strategies and be implemented fully to enhance performance. Also, it was concluded that customer satisfaction on all its services were key to improvement of its performance. Proper marketing strategies would boost the public image and the reputation of the Kenya Airways. This would in turn through multiplier effects draw more customers to Kenya Airways boosting its revenue base. Further, it was concluded that the marketing strategies are effective turnaround strategy for any organization. The study concluded that diversity marketing, transactional marketing, social media marketing, relationship marketing and the celebrity endorsement were the key elements associated with marketing strategies applicable to Kenya Airways. In addition, it was concluded that there exists a positive linear relationship between marketing strategies and the performance of Kenya Airways. This implied that transformed and efficient marketing strategies translated to better turnaround strategies and improved performance for Kenya Airways.

The study recommends that customer satisfaction in all services of Kenya Airways be implemented. Satisfied customers will be help in marketing Kenya Airways to potential customers hence boosting its reputation and image. Meeting customer needs is recommended as the first goal of Kenya Airways in its turnaround strategy. Based on the findings of the study, it is recommended that diversity marketing, transactional marketing, social media marketing, relationship marketing and celebrity endorsement to be implemented by Kenya Airways as part of marketing strategies. Moreover, the research recommended proper designing and package of the marketing strategies and ensure they are implemented fully. Marketing strategies were recommended to be enhanced in all operations of Kenya Airways to improve its performance.

One of the limitations of this study is that it focused only on turnaround strategies in relation to performance. Future research may consider to investigate the management of funds and extent of corruption in Kenya Airways. This is due to the fact the government of Kenya has been bailing out the airline regularly yet it continues to report huge losses and deteriorated performance. Moreover, from the findings of the research, it has been established that the respondents cannot tell whether the emerging airlines for local transport are threats to the performance of Kenya Airways. Therefore, studies should be carried out to investigate the effect of emerging airlines for local transport on the performance of Kenya Airways.

ABSTRACT

There has been decline in the financial performance of banks dealing with mortgage financing which is mainly brought by mortgage defaults by customers. Mortgage financing has been viewed as an important aspect in the banking sector, though it has not been adopted fully by the financial institutions. Those that have adopted the scheme have a lot of challenges of mortgage defaults which affects the financial performance of commercial banks. The sector has been pointed out as an alarm factor that possesses challenges to housing segment repayment. The study is guided by the following objective: To assess the effect of mortgage interest rates on financial performance of commercial banks listed in the Nairobi Security Exchange. The study research hypothesis was that mortgage interest rates has no effect of on financial performance of commercial banks listed in the Nairobi Security Exchange, Kenya. The study was grounded on the theoretical premise of mortgage financing theory framework. For this study the most appropriate design used was a descriptive research design. The study drew samples from the population of 11commercial banks quoted in the NSE and that deal with mortgage financing. The research used census sampling method. Secondary data was collected for this study. The data on mortgage interest rate was available on financial reports. The data was entered into SPSS version 21 for analysis. Ordinary least squares were used to model a regression function that explains how the independent variables influence the dependent variables. The study revealed that higher level of market interest rates improves mortgage firm's profitability.

Keywords: *mortgage financing, performance, commercial banks and interest rates*

1.1 Background of the study

The aim of home loan variation is meant to decrease a person's contact with unaccounted for changes in the rates of interest. If there are uneven rates which go shoot up and get half of one's debt in a durable fixed rate, an individual be less disadvantaged as compared to if their home loan in a differentiated or short time period. On the other hand, given that rates go down, an individual with home loan still get to gain benefit. Rasmussen and Clausen, (2007), determined that in the present day, people in possession of homes are presented with a variety of home loan choices for aiding in buying of houses. In many cases, owners of homes are additionally given different option of paying back their home loans. In some nations, it is important and competent to provide options of paying back loans in accordance to the situations of a market or the conditions of owners of homes. While only one home loan would carter for the requirements of a borrower in the past, it is different today because now it seems that an assortment of loans serve better the home loan requirements of a person ant the level of risk they are willing to take. True to it, it can be determined with ease that an assortment of home loans is capable of giving decreased standard entire pay back throughout the period of a home loan, and with less inconsistency as rates of interest transform, (Zenios, 2007).

In the latest years in Kenya, spontaneous creation of different mortgage-backed securities has caused fundamental change in the mortgage segment. As a result of the evolving home loan market and special financing needs due to extensive acquisition of homes leading to notable changes in home loan lending tradition. Commercial banks act as monetary go-in between so as to mobilize resources that drive the economy of the world. Financial institutions, particularly Banks play a great role in financing houses. Microfinance institutions adopt mortgage financing for different reasons such as high rates of interest,

market penetration as well as cross selling which are strategies to increase profit. The relationship between mortgage financing and profitability is therefore expected to be positive (Chen, 2016).

In Kenya, investment in mortgage financing will lead to higher profitability since the mortgage market in Kenya comes number three in terms of mortgage development in the African Sub-Saharan having home-loan assets that are equal to 2.5% of the GDP of Kenya, (Al-Tally, 2014). The size and growth of mortgage market has seen growth in profitability of the microfinance institutions that have been offering mortgage credit to Kenyans. Giving mortgage loans to qualified applicants means that MFI's funds are held up and that these funds will be paid back later on and can only happen if financial institutions expect to make profit from the investment, (Kariuki, 2013). As stated, speedy growth of various securities to back mortgages in latest years has resulted into essential changes in the Kenyan mortgage segment. The transforming home markets and the special monetary needs caused extensive possession of homes hence an ongoing growth in mortgage distribution tradition. As monetary go-in between, Commercial banks mobilize resources in terms of money that in turn drive economies of the world.

1.1.1 Mortgage interest rate

Interest rate is the rate of return on investment and the cost of borrowing funds (Chen, 2016). Interest rates are a price for the use of funds and if rapid monetary expansion contributes to excessive demand and inflation, it also contributes to rising interest rates. Central Bank's role under the interest rate instrument is to set a short-term official rate of interest, which indicates the price at which it will make liquidity available to the banking system as a lender of last resort. In Kenya, this rate is called the Central Bank Rate. This rate is reflected in the CBK overdraft rates.

Mortgage interest rates vacillate depending on larger economic factors and investment activity. Mortgage interest rate indicates the annual cost to borrow money from the lender. The rate is expressed as a percentage of the total loan balance and is paid on a monthly basis, along with principal payment, until the loan is paid off.

In using interest rates, first the Central Bank sets a target inflation rate and then interest rates are steered to move inflation to its intended levels. In this case, interest rates are increased when the inflation rate is above the target rate, and reduced when inflation is below the target rate. A reduction in the official rate for instance, encourages the commercial banks to borrow money from the Central Bank, thereby increasing money supply in the economy. Mortgage interest rates reflect the general lending rate of banks as any other loan in the banks.

1.1.2 Performance of commercial banks

The banking business in the nation is run by several acts including, The Companies Act, (1978), The Banking Act, (1991), the Central Bank of Kenya Act, (1984) as well as the different credible rules set by the Central Bank of Kenya (CBK). Liberalization of the banking industry begun in 1995 and it is the time at which control on exchange was done away with. Central Bank of Kenya is categorized in the Finance Minister's section and is tasked with creating and executing financial policies and promoting the liquidity, solvency and proper performance of the monetary structure. As one of its roles, Central Bank of Kenya provides information on the commercial banks as well as non-banking sectors that operate in Kenya and also information on the rates of interest rates in addition to other financial publications and rules. The Kenya Bankers Association (KBA) provides an umbrella for Kenyan banks under which they can act on their interests and work out challenges that the members experience, (CBK, 2012).

CBK controls all the Kenyan financial institutions in addition to other micro-financial organisations as provided for by Kenya rules and regulations under the bank act. Commercial banks seem to be the leading titans in the nation's finance system and they are thoroughly scrutinised by regulators to

warrant that they are in consistent with following the laws and directions. The Kenyan finance industry comprises of 43 banks registered total net assets of Ksh. 2.7 trillion as at 31st December 2013, (CBK 2013). The classification of banks in Kenya is in three different tiers depending on a weighted composite index of their assets, productivity, funds and capitals as well as other fiscal aspects, (CBK, 2015).

According to the NSE, there are 11 listed commercial banks in Kenya, (NSE, 2014). For the sole purpose of hiking their profits, Kenyan Commercial Banks have ventured into real estate and lending finances to consumers, (Ng'ang'a, 2012). This tendency has taken roots in the Kenyan commercial banks as they look into expanding loan assortment as well as reducing the risks associated with the unsecure loans that are common to people in the country. For instance, just close to 5% of the loan from the banking system was channelled into real estate (RE) from 1997-2008 with a decreasing tendency, close to 6% was channelled into private households (PH) with a hiking tendency and about 2% into consumer durables (CD) which also had an increasing tendency.

1.1.3 Objective of the study

To assess the effect of mortgage interest rates on financial performance of commercial banks listed in the Nairobi Security Exchange, Kenya

1.1.4 Hypothesis/ research question

HO_1: Mortgage interest rates has no effect of on financial performance of commercial banks listed in the Nairobi Security Exchange, Kenya

1.2 Statement of Problem

There has been decline in the financial performance of banks dealing with mortgage financing which is mainly brought by mortgage defaults by customers. The banks have not been making significant profits mainly because of the interest rates capping introduced in 2016 by the government. This also leads to the decline in return on equity and assets of commercial banks. Mortgage financing has been viewed as an important aspect in the banking sector, though it has not been adopted fully by the financial institutions (CBK, 2011). Those that have adopted the scheme have a lot of challenges of mortgage defaults which affects the financial performance of commercial banks. The sector has been pointed out as alarm factors that possess challenges to housing segment repayment. The mortgage defaults are due to low income level earnings by individuals in the country which leave the banks unpaid the full amounts by their clients (Ndururi, 2013) hence poor performance of commercial banks. Therefore, there is need therefore to assess the influence of mortgage financing on financial performance of commercial banks in Kenya.

2.1 Theoretical Review

The theory supposes that the chief objective of a bank is to maximize its profits despite the constraints of its soundness, liquidity, lawfulness and liquidity. Decision making in banks are motivated by the ability of the decisions to create more value for the shareholders and this has seen the adoption of systems that mitigate against risk. The theory applies to how banks provide funding for real estate projects by instituting systems that increase return management and mitigated risks. The theory emphasizes on optimization of risk, identification of risks, reward of efficient portfolios and precise determination of expected value derived from a loan issued, (Doling, 1997).

The Mortgage financing theory posits that the banks plans the fiscal value of new retail mortgage business and permits the business to make calculated and tactical decisions based on projected profitability. This theory treats mortgage as a long-term investment that spans over a longer period. Financing contractual agreements in mortgage has impressed upon banks the need to be prepared to finance long-term loans and they can also invest in providing real estate products to their followers,

(Benington & Moore, 2010). According to the theory, the lack of a long –term finance will imply that the banks won't have the capacity to finance building of new properties and thus the mortgage market will considerably shrink since the providers of funds won't have the capacity to offer mortgage loans.

2.3 Empirical Review

Sinaida, (2017) carried out a research on the effect of lending interest rates on financial performance of commercial banks in Kenya. The main goal of the study was to determine the effect of lending interest rates on financial performance of commercial banks in Kenya. A descriptive research design was adopted. The sample population for the study was 42 banks registered before 2016. The study relied on secondary data in the form of publications about bank accounts for the period 2012-2016. The data gathered was analyzed using both descriptive and statistical analysis. The regression analysis showed that there was a significant relationship between lending interest rates and financial performance in banks. An increase in interest rates on loans results in better performance by banks (Sinaida, 2017). The study identified a gap in the market regarding information asymmetry. The information about property price indices and general information was lacking and the study intended to fill gap in order to improve mortgage evaluation by customers.

Odalo, Achoki, & Njuguna, (2017), carried out a research on the influence of interest rate on financial performance of agricultural firms. The study adopted a descriptive and causal research design. The trio undertook a census of the 7 registered agricultural firms. Questionnaires were administered to 220 respondents working in the firms in the finance department. The primary data collected were analysed using statistical analysis. The findings revealed that interest rate has a positive and significant relationship with ROA, ROE, and EPS. Another study by Wambari and Mwangi (2017) on the effects of interest rates on financial performance by commercial banks in Kenya suggested that interest rates had a significant effect on the financial performance of banks. The study adopted an explanatory research design and targeted 47 commercial banks. The study used secondary data which was analysed via SPSS version 20 by applying multiple regression analysis. The findings reported that lending rates affected financial performance positively while deposit rates affected the banks negatively (Wambari & Mwangi, 2017). The gap this study intended to fill was to provide sufficient information regarding the effectiveness of mortgage financing management. The information of management of time, loan sizes, training and interest rates was critically missing in the existing body of knowledge.

Njoroge, (2013) in his study on determining the relationship between interest rates and financial performance of firms listed at the Nairobi securities, established that there is a link between interest rates and financial performance. However, the significance of the relationship differs among companies and interest rates. The study aimed at assessing the relationship between interest rates and financial performance. The study adopted the causal research design to establish the link between interest rates and financial performance. The target population for the study was 56 firms registered in the Nairobi securities exchange. Secondary data was the only data used in the study. The secondary data comprised of publications of by the Central Bank and financial statements of 56 firms listed in the Nairobi security exchange for the period 2008-2012. The data were analysed using regression analysis. The study recommended further studies on the factors affecting financial performance other than interest rate, which had little to no significance with financial performance.

Table 2.8: Summary of Literature Review and Research Gap

The study provided a complex and in depth link between interest rates and financial performance in Kenya.
Odalo, Achoki, & Njuguna, (2017)	The study adopted a descriptive and causal research design. The trio undertook a census of the 7 registered agricultural firms. Questionnaires were administered to 220 respondents working in the firms in the finance department.	Influence of interest rate on the financial performance of agricultural firms listed at the Nairobi securities exchange	Financial institutions and banks in Kenya should assess their clients which include agricultural firms listed in NSE while setting up interest rates policies.	Interest rate has a positive and significant relationship with ROA, ROE, and EPS.	The study covered the effects of interest rates on financial performance of the agricultural sector.

Source: Research, 2018

2.4 Conceptual Framework for the Study

A conceptual framework is a diagrammatic presentation of the relationship between dependent and independent variables. The independent variable is mortgage interest rates while the dependent variable is financial performance.

Independent Variable **Dependent Variables**

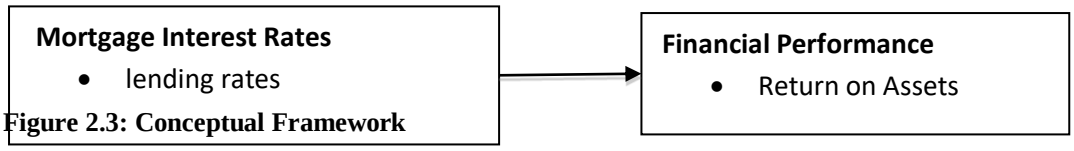

Figure 2.3: Conceptual Framework

Source: Researcher, 2018

3.1 Methodology of the study

Research design

The study adopted a descriptive research design. It targeted 11 quoted commercial banks that deal with mortgage financing (NSE, 2017). The study adopted a census method therefore composed of all the 11 listed commercial banks.

Data collection

Secondary data was collected for this study. This data was useful for generating additional information for the study from already documented data or available financial reports as per the document. The data on mortgage interest rate was available on financial reports. This essentially suggests that the assimilation of valued statistical data in the study. The research procedure included the preparation of the financial statements for secondary data. This was followed by the recruitment of Research Assistants to gather data from the commercial bank's websites. The enumerators were trained on the research tool to minimize data collection errors. The enumerators also were retained for the whole period of data collection.

Data analysis

The secondary data collected was checked for completeness in order to ensure that relevant data for each of the years is available. The data was entered into SPSS version 21 for analysis. Ordinary least squares were used to model a regression function that explains how the independent variables influence the dependent variables. The effects of determinants of mortgage financing on the financial performance was determined by conducting a time series analysis. The model that used to carry out the data analysis is given below. Y is the dependent variable while X_1, X_2 and X_3 are the independent variables.

$$\mathbf{Y = \beta o + \beta_1 X_1 + \beta_2 X_2 + \beta_3 X_3 + \mathcal{E}}$$

Where Y = Financial Performance (measured by Return on Assets)

$\mathbf{X_1}$ = Mortgage Borrowing Cost (measured by Actual Borrowing Cost – Income from investment)

X_2 = Mortgage Interest rate (measured by Average annual lending interest rate (Total monthly lending rates/12))

$\mathbf{X_3}$ = Mortgage Income level (measured by average net income)

$\boldsymbol{\beta_0}$ = constant

$\boldsymbol{\beta_1}$, $\boldsymbol{\beta_2}$, and $\boldsymbol{\beta_3}$ are the regression co-efficient or change introduced in Y by each independent variable

$\boldsymbol{\mathcal{E}}$ is the random error term accounting for all other variables that affect financial performance but not captured in the model.

This study used ANOVA to test the significant level of the independent variables on the dependent variable at 95% level of significance; the ANOVA tested whether there is any significant change or variance between the variables.

4.0 Findings

Table 4.9: Mean of Interest Rates

Year	Min	Max	Mean	Std Dev
2009	17.171	20.274	18.104	0.362
2010	16.758	19.238	18.693	0.251
2011	13.122	19.147	16.104	0.241

2012	14.141	17.463	17.152	0.152
2013	15.366	19.374	16.296	0.147

Source: Research findings (2019)

The results in table 4.3 of the trends of interest charged on mortgage loans offered by the commercial banks listed in NSE revealed unsteady fluctuations in interest charged on mortgage loans for the period 2009 to 2013. The interest charged on mortgage loans increased steadily from 18.104 in the year 2009 to 18.693 in the year 2010. The trends however revealed steady decline in the Interest charged on mortgage loans offered by the commercial banks to 16.104 in the following year (2011) before steadily increasing to 17.152 in the year and dropping again to 16.296 in 2013. The study duration has therefore recorded an overall unsteady decline in the interest charged on mortgage loans offered by the commercial banks listed in NSE. The findings contradict with Odalo, Achoki and Njuguna (2017) that interest rate has a positive and significant relationship with ROA. The findings reported that lending rates affected financial performance positively while deposit rates affected the banks negatively.

4.3 Regression Analysis

4.3.1 Model Summary

In this study, a multiple regression analysis was conducted to test the influence among predictor variables. The research used statistical package for social sciences (SPSS V 21.0) to code, enter and compute the measurements of the multiple regressions. The model summary are presented in the table below

Table 4.10: Model Summary

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	.847[a]	.717	.684	.34156

Source: Research findings (2019)

The study used coefficient of determination to evaluate the model fit. The adjusted $R^{2,}$ also called the coefficient of multiple determinations, is the percent of the variance in the dependent explained uniquely or jointly by the independent variables. The model had an average adjusted coefficient of determination (R^2) of 0.684 and which implied that 68.4% of the variations in performance of commercial banks listed in Nairobi Security Exchange are explained by the independent variables understudy (mortgage borrowing cost, mortgage **interest rates** and mortgage income level).

4.3.2 ANOVA

The study further tested the significance of the model by use of ANOVA technique. The findings are tabulated in table below.

Table 4.11: Summary of One-Way ANOVA results

Model		Sum of Squares	df	Mean Square	F	Sig.
1	Regression	22.341	3	7.447	6.453	.000[b]
	Residual	8.078	7	1.154		
	Total	30.419	10			

Source: Research findings (2019)

Critical value =2.50

From the ANOVA statics, the study established the regression model had a significance level of 0.0% which is an indication that the data was ideal for making a conclusion on the population parameters as the value of significance (p-value) was less than 5%. The calculated value was greater than the critical

value (6.453>2.50) an indication that mortgage borrowing cost, mortgage interest rates and mortgage income level all have a significant effects on the performance of commercial banks listed in Nairobi Security Exchange. The significance value was less than 0.05 indicating that the model was significant.

4.3.3 Coefficients of Determination

In addition, the study used the coefficient table to determine the study model. The findings are presented in the table below.

Table 4.12: Coefficients

Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.
		B	Std. Error	Beta		
1	(Constant)	1.194	.205		5.824	.004
	Mortgage Borrowing Cost	-.575	.107	-.507	5.374	.012
	Mortgage Interest Rates	**.435**	**.094**	**.411**	**4.628**	**.014**
	Mortgage Income Level	.456	.082	.424	5.561	.013

Source: Research findings (2019)

As per the SPSS generated output as presented in table above, the equation ($\mathbf{Y = \beta_0 + \beta_1 X_1 + \beta_2 X_2 + \beta_3 X_3 + + \varepsilon}$) becomes:

$$\mathbf{Y= 1.194 -0.575X_1 +0.435X_2 + 0.456X_3}$$

From the regression model obtained above, a unit change in mortgage interest rate holding the other factors constant would positively change the performance of commercial banks listed in Nairobi Security Exchange by a factor of 0.435. The analysis was undertaken at 5% significance level. The criteria for comparing whether the predictor variables were significant in the model was through comparing the obtained probability value and α=0.05. If the probability value was less than α, then the predictor variable was significant otherwise it wasn't.

5.0 Summary, Conclusion and Recommendations

Further the study established that interest rates charged on mortgage facility were dependent on the collateral attached to the borrowed funds. Commercial banks base the mortgage rates on the volatility of the CBR as their lending rate. CBR affect the mortgage financing since the mortgage rates are pegged towards CBR. The increase in CBR leads to a consistent increase in the mortgage rate which tends to slowdown mortgage uptake. High mortgage rate leads to an increase in cost of borrowing, leading to defaults by borrowers and foreclosures. Conversely, high mortgage rates results to increase in profits by mortgage issuing firms, Interest rates charged on mortgage financing loans remained the same during the entire period of servicing the loans. The CBK sets its rate for overnight loans to commercial banks at 8.5%. The commercial banks ought to use the CBK interest rate to set their prime lending rates. This is not the case; the banks are still offering mortgages with interest rates as high as 28% (CBK, 2013) these findings concur with the findings by Worthington (2003) observed that prevailing interest rates affect the financial performance of firms.

The findings of this study also revealed that a unit change in Mortgage interest rates while holding the other factors constant would positively change the performance of commercial banks listed in Nairobi

Security Exchange by a factor of 0.435, The findings go hand in hand with the study findings by Cook (2015) who established that the impact of variations in market interest rates on banks' profitability largely depends on the degree of responses of asset and liability rates.

Conclusion of the study

On mortgage interest rates that mortgage interest rates have a significant influence on ROA and overall financial performance, it can be concluded that commercial banks in Kenya banks should always ensure that the mortgage interest rates are friendly and reasonable to facilitate participation of borrowers in mortgaging as it contributes to greater returns for commercial banks.

Recommendations of the study

The study recommends that commercial banks in Kenya should always ensure that appropriate and friendly mortgage interest rates and uptake of interest rate capping which are informed by the changes in the market environment and the government regulations and consider them when issuing the mortgage to the customers.

Implications to Theory and Practice

The study contributes to empirical literature on mortgage financing and financial performance of commercial banks listed in the Nairobi security exchange, Kenya. Specifically, the study found that mortgage interest rates have a significant influence on ROA and overall financial performance of commercial banks listed in the Nairobi security exchange, Kenya. Therefore, the study findings contribute to the knowledge of mortgage interest rates by providing empirical evidence on effect of mortgage financing on financial performance.

The study contributes to the theoretical literature by supporting the proposition of the Mortgage financing theory that decision making in banks are motivated by the ability of the decisions to create more value for the shareholders and this has seen the adoption of systems that mitigate against risk. The theory applies to how banks provide funding for real estate projects by instituting systems that increase return management and mitigated risks. The theory emphasizes on optimization of risk, identification of risks, reward of efficient portfolios and precise determination of expected value derived from a loan issued.

Marketing Mix and Adoption of Improved Sanitation Products among Rural Households in Magarini, Kilifi County Kenya

Muteshi, K. Hilda

Kenyatta University, School of Business, Department of Business Administration.

Maina, S. M., PhD, Lecturer

Kenyatta University, School of Business, Department of Business Administration.

ABSTRACT

Adoption of improved sanitation has remained a challenge over a period of time. Kenya is one of the countries that missed the MDG target, with almost 70% lacking access to improved sanitation, and approximately 6 Million Kenyans defecating in the open. There is evidence of social marketing strategies being used to change behavior and increase adoption of products with health benefits. However the use of the conventional marketing strategies is scantly explored. This research sort to seek the following specific objectives: 1) the effects of product attributes on adoption of improved sanitation among rural households in Magarini, Kilifi County, 2). the effects of price on adoption of improved sanitation among rural households in Magarini, Kilifi County, 3. the effects of promotion on adoption of improved sanitation among rural households in Magarini, Kilifi County, 4. the effects of product placement on adoption of improved sanitation among rural households in Magarini, Kilifi County. Primary data was collected from a total of 375 households. Using semi structured questionnaires. Data was analyzed using both descriptive and inferential statistical methods. In particular multiple regression was also used to establish the effect of marketing mix on adoption of improved sanitation as well as the change in R^2 with introduction of income and payment options as a moderator. Findings indicate that community meetings, friends and relatives play a great role in influencing adoption. The marketing mix significantly influence adoption and the relationship is moderated significantly by income and payment mode used by the providers. The study recommends introduction of flexible payment options as a way of increasing adoption as well as utilization of community volunteers as sales agents.

Keywords: Improved sanitation, Millennium development goals and marketing mix.

Introduction

Better part of developing countries can be classified as rural and these areas are characterized by: low investment in business and social amenities, which affects access to education, proper housing, sanitation and healthcare services (Rao, 1985). Marketing is an instrument to deliver a standard of living rather than a process of exchanging goods and services to satisfy human needs and wants (Rao, 1985). The rural population tend to look for specific values. In order to penetrate the rural market, marketers need to consider many factors including how affordable the product is to the target customer both economically and psychologically, the attitude towards the product, the preference of the product by customers, the basic knowledge about the product, the brand familiarity (awareness) and the reachability or convenience to point of sale (Sheth, 2012).

Subsequently social marketers are playing a great role in changing social behaviors to ensure product adoption (Kotler, 2012). Kotler and Zaltman (as cited in Lokhande 2014) refers to social marketing as the calculated move to design programs that can influence the acceptability of social ideas, implementing product pricing, communication strategies distribution channels and market research. Marketing on the other part is the application of commercial Marketing strategies to product development, pricing, promotion and distribution in order to influence voluntary social behavior to improve the individual and societal welfare (Murlidhar, 2014). The right product at affordable prices is accompanied by better distribution and use of appropriate communication techniques and they act together in costumers' views (Išoraitė, 2016). . The right market solution should affordable, well distributed, communicated to create awareness, and reach the consumer in a more convenient way (Išoraitė, 2016)

The rural market has several challenges including low disposable incomes, unstable irregular income, seasonal planned expenditure heavily depended on cash crop and special occasions, poor roads networks, lack of access to electricity and lack of exposure to advertising (Chintan Shah, 2013). Besides the right marketing mix, the demand for a product is affected by other social and economic factors. For instance , the household income level, the source of income, the expected income that can be spend on a toilet, the expected price, the prioritization of a product by households and the willingness to pay can moderate the relationship between marketing mix and adoption.

Marketing mix and product adoption

Mutuku (2011) in the study on influence of marketing mix on consumer brand preference on user of smartphones among public university students in nairobi' found out that students are motivated by both the features, and the brand origin of the smart phone. Further ShanthakuMary (2004) in the study on the impact of marketing mix on consumer buying behavior, found a high positive relationship between marketing mix and brand loyalty Subsequently Gituma (2017) study on the effects of marketing mix on sales performance argued that product quality positively influence sales.

Cavusgil (1996), suggested that factors such as cost of production inputs, demand, external competition and the rate of exchange should be put into consideration when pricing a product (Marmullaku, 2015). As much as lower prices for inputs will increase adoption, other factors like product preferences, product quality, come into play to determine adoption (Karina, 2011). Results from various studies indicated that stable prices increase adoption of technology, (Ahaiwe, 2015). The choice of distribution channels can affect pricing strategy, at the same time product pricing also has an impact on distribution channel choice. The more intermediaries a firm includes in distribution strategy the more the effect on product's price, this is because every member of the channel seeks to make profit (Cuellar-Healey, 2013). Abdullah (2014) argues that most consumers make the decision to purchase a product based on price, this decision has very little to do with brand name or product accessibility

From a study of hypo bleach products in Nigeria it is evident that integrated marketing communications leads to high level of awareness (Ahaiwe, 2015) Many companies conduct market research to introduce products to the customers even before the product is launched (Svetlana, 2014). Promotional activities like advertising increases sales since a number of customers acquire products by impulse (Svetlana, 2014).

Economists believe that there is a correlation between advertising expenditure and product adoption, that increase in advertising budget will lead to an increase in sales, this has worked well for large scale enterprises like Proctor & Gamble which in 2011 increased expenditure on advertising and realized a 7.2% increment compared to 2010, (Adage, 2011).it should be noted that, the increase in advertising budget will not have an impact on sales , if the previous sales were attributed to other channels of communication other than advertising eg word of mouth (Gitau, 2012).

For Manufacturers to remain competitive, they have to adopt a distribution channel strategy that optimizes their manufacturing and business process , such strategies are delivered in relation to key partners and players in the industry (Parrish, 1995) Adoption will depend on successful distribution channel selection, distribution channels are designed to cost effective at the same time meet customer shopping needs (Cuellar-Healey, 2013). Product positioning and product pricing too have an impact on the choice of distribution channels (Cuellar-Healey, 2013). In choosing a distribution channel, it's important to select a channel that is cost effective, efficient in reaching target audience, it's important to know where the target customers located, the time they are likely to buy, the place they buy from, how much they buy and why they buy (Cuellar-Healey, 2013)

Successful distribution coverage can be measured by the intensity with which the product is made available to the customers (Cuellar-Healey, 2013). This finding is important in assessing how well enterprises have chosen distribution channels for sanitation products and how available this products are. Gituma (2017) found out that locating distribution channels in urban centers can lead to more returns on investment than rural channels, it was also established that use of distribution channels influences product availability, store design has a positive effect on consumer purchase and sales volume, use of distribution channels influences sales and profit (Gituma, 2017). This type of perception

can have an effect on adoption of improved sanitation, it's important to establish the location of distribution channels in relation to target customers

Intangible products affects consumers' pre-purchase behaviour, distribution channels give an opportunity to consumers to evaluate products before making decisions (Daniel, 2014). Consumers being exposed to a distribution channel like brick and motor shops get a chance to impact and test the product hence influencing decision making (Cox & Rich, 1964) as cited in (Daniel, 2014). Direct distribution is desirable for custom made products, same applies to industrial user products (Daniel, 2014). Direct distribution can also be applied to technical products that requires personalized selling, unique talent, skill or service, products of high unit value that are sold by travelling to the customer unlike customers coming to point of sale (Chand, 2018). Lack of experience in distribution makes new companies rely on middlemen for distribution, similarly, lack of financial muscle by an enterprise can make the managers choose to work with middlemen, on the contrary when a company doesn't want to lose control over its communication, control, it's likely to adopt direct distribution (Chand, 2018). Apart from channel compensation at every point of sale, there are other costs like personnel compensation, insurance, storage, and interest on inventory which are likely to affect the choice of distribution channels (Chand, 2018). Studies have found a significant relationship between distribution channel differentiation and performance this means that the more channels are differentiated the more the increase in performance (Adimo, 2017)

Rural markets are fragmented, heterogeneous, they have poor road networks, poor access to communication channels, lack of warehousing facilities which hinders market penetration and growth (Shah, 2013). Companies seeking to penetrate rural markets have to consider how to ensure awareness, affordability, availability and acceptability of products (Shah, 2013). Kavitha concluded that the real challenge is to develop business models that address accessibility, affordability and availability in an appropriate manner. Therefore, the marketer's should understand the social, economic, psychological background and value system of rural folks as cited in (Krishna, 2013). For this reasons the 4Ps marketing mix may not guarantee adoption without considering the 4As of rural marketing. It is important for this research to correlate the 4As of rural marketing with adoption of improved sanitation and establish the presence of any mediation effect between 4Ps marketing mix and adoption

From the literature review, the 4Ps (product, price, promotion, place) were the main independent variables while adoption of improved sanitation was the dependent variable. The study hypothesized that:

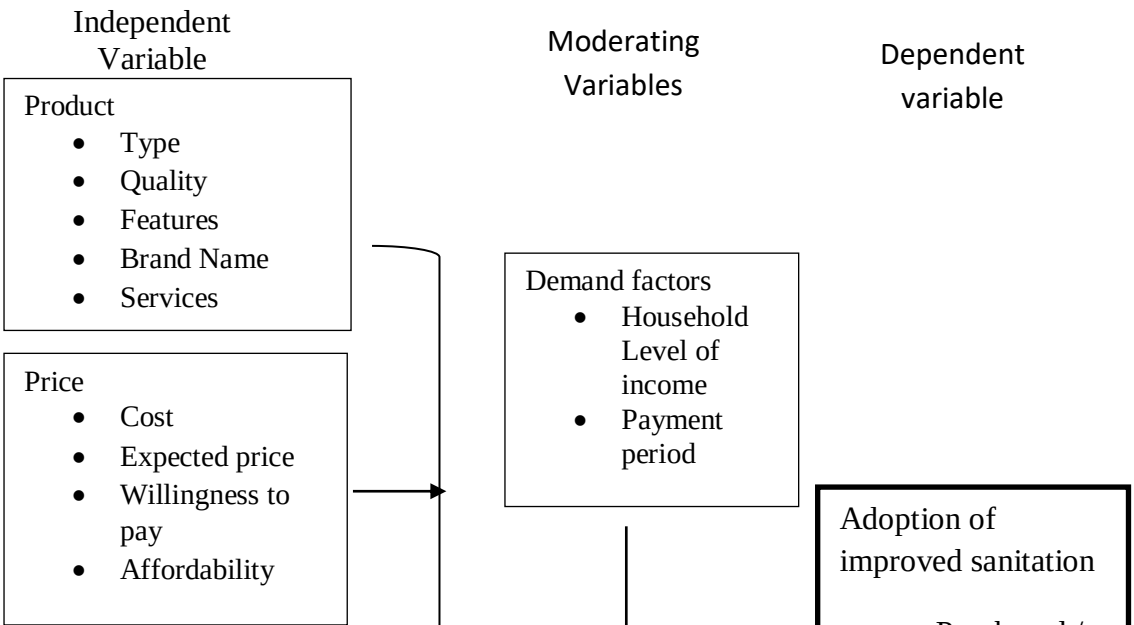
H_{01} Product attributes have no statistical significant effect on adoption of improved sanitation among rural households in Magarini, Kilifi County

H_{02} Price does not have statistical significant effect on adoption of improved sanitation among rural households in Magarini, Kilifi County

H3 Promotion does not have statistical significant effect on adoption of improved sanitation among rural households in Magarini, Kilifi County

H4 Product placement does not have statistical significant effect on adoption of improved sanitation among rural households in Magarini, Kilifi County

The figure 1 demonstrates the hypothetical relationships anticipated



Methodology Study Design and Data Collection

Descriptive and explanatory research design were used in the study. Descriptive design focused on examining the household characteristics explaining the effects of variables in relation to current status of improved sanitation adoption. It looks at relationship between marketing mix variables variable and adoption of improved sanitation as moderated by demand factors and government subsidy policy. This study also employed qualitative and quantitative the quantitative approach involved hypotheses, while a qualitative approach was used in inductive testing using scale. A total of 375 households were selected using stratified sampling while, with individual households identified by convenience

Data Analysis and Presentation

Qualitative data was analyzed using the five standardized steps of documenting data collection, organizing and categorizing the data into concepts, creating connections between the concepts verifying the data collected and presenting the data collected. Quantitative data was recorded on a spreadsheet and analyzed through SPSS. The descriptive analysis was to show the relationship between the 4Ps and adoption while the inferential statistics were used to show the level of significance of each variable and the change in R^2 upon introduction of a moderator

.

Data Analysis, Results and Discussions

Response rate

A total of 375 questionnaires were administered, across various areas, feedback was collected from 367 questionnaires. Only 8 questionnaires were not returned. This can be accounted from the sample size as 7 from Adu and 1 from Garashi. This translates to 97.86% response rate. With 100% response from Gongoni ward. The response rates are as indicated in the tables below. With 47% male respondents and 53% female respondents

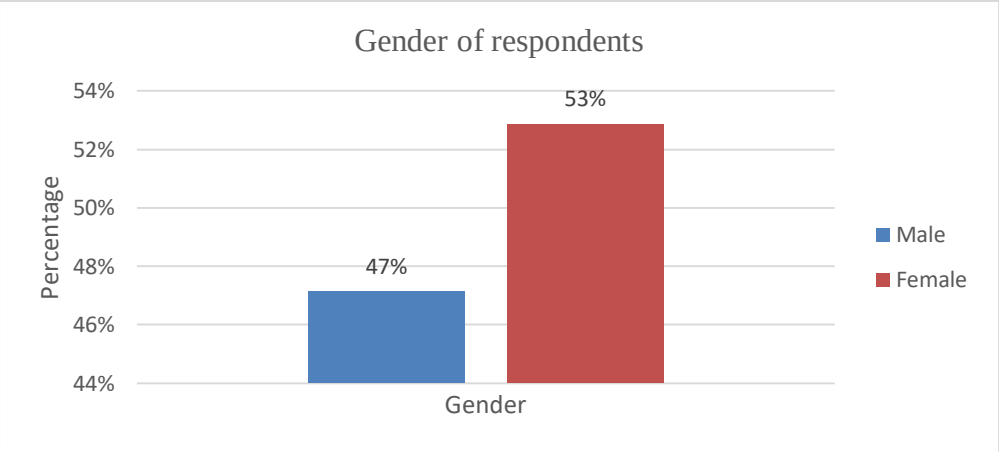


Figure 2 Response rate Source Researcher (2018)

Household sources of income and income levels

A majority of households 44% work in informal sector, 35% are self-employed, 1% have no income. From these, 55% earn less than 10,000 Kenya shillings with only 6% earning between 30,000 and 40,000, 3% earning between 40,000 and 50,000 while only 1% earning above 50% shilling per month. World bank sets affordability of a toilet at 5% of annual income, this implies that a toilet sold at 6,000 Kenya shillings will be affordable to 55% of the population, while a toilet sold at 12,000 Kenya shillings is affordable to 21% of the population, a toilet set at 18,000 will be affordable to 15% of the population. Only 9% will afford a toilet 20,000 shillings and above.

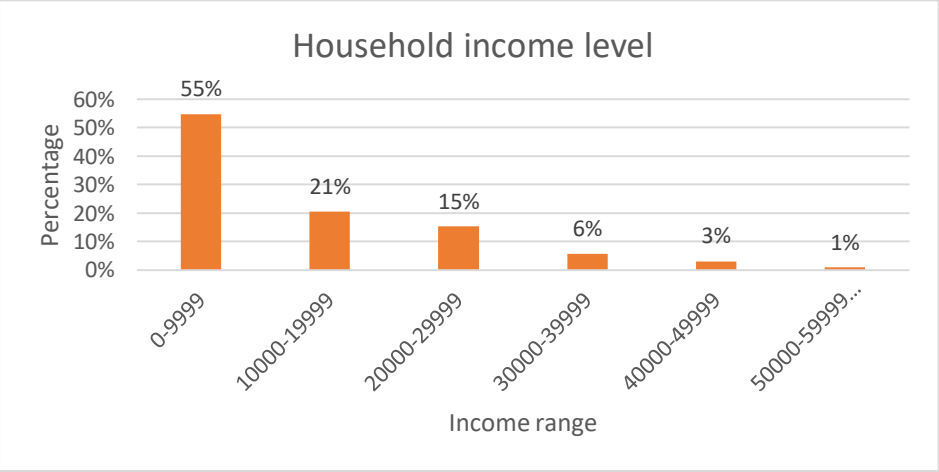

Figure 3 household level of income Source Researcher (2018)

Toilet adoption rate

At least 30% of the population admitted not to own a toilet at the time of the survey, of which 25% of this population admitted to defecate in the bush. This was subject to social desirability, the findings were triangulated with how the toilet was acquired, which revealed that 14% of the people who said they own a toilet are sharing toilets with the neighbour. This means that the no. of people who don't

own toilets is more than 30% approximately 44%. Sharing of a toilet is considered lack of access in rural areas due to the distance and inconvenience at night. It was established that only 16% have access to improved sanitation while 59% use the traditional pit that does not meet the standards of an improved toilet. This means that there is need for improved sanitation and all the people with traditional pit and those practicing open defecation form 84% of the total target market

Figure 5 percentage households that own toilet

Source Researcher (2018)

Most households 68% constructed the toilets themselves, 12% engaged a professional artisan, 4% sort community support while only 3% have benefited from NGO/GOK subsidy. The 14% sharing a toilet are considered not to have acquired. Most toilets are self-developed, this is one way of cutting down on the cost. This implies that a "Do it yourself" type of improved toilet could be ideal for rural households and can increase adoption of improved sanitation. There is need for further research on the effect of cost of labour on improved sanitation and its level of significance

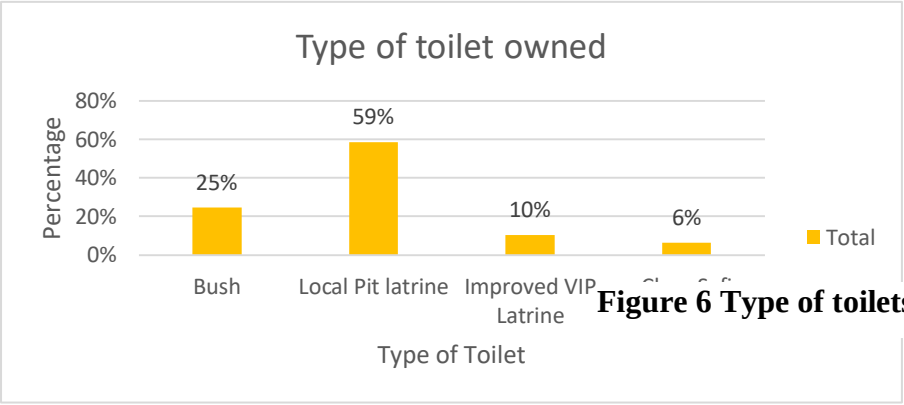

Figure 6 Type of toilets owned by households

Source Researcher (2018)

Product Preference

78% of the population intents to purchase/ construct a toilet in the near future. Of these percentage, 46% intent to construct improved VIP, 29% choosafi brand, 24% will Construct traditional pit, while 1% intent to construct other types of toilets. From the intention to purchase, we can predict 75% potential market for improved sanitation.

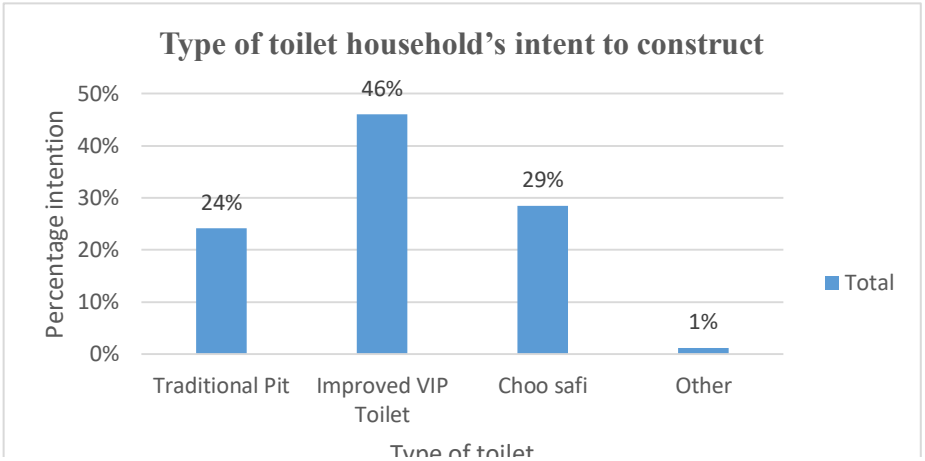

Figure 7 Percentage households with intention to purchase a toilet

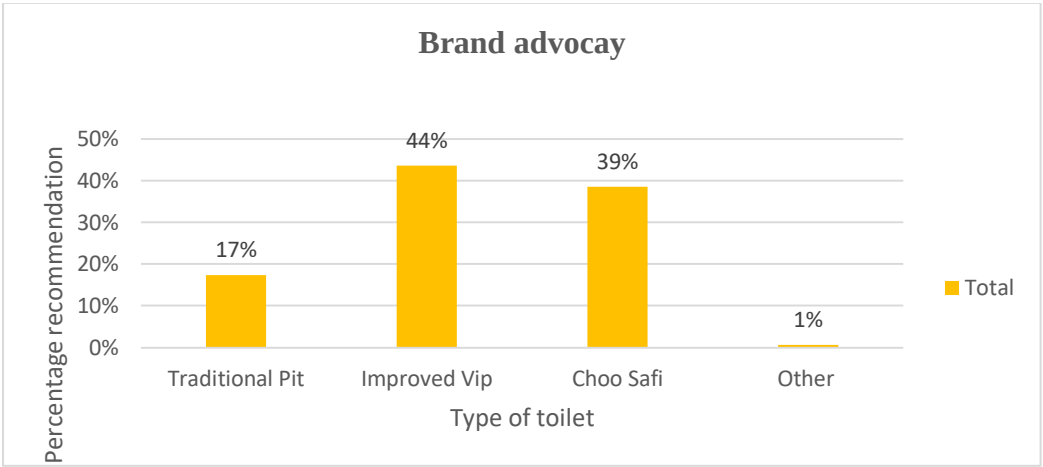
Source Researcher (2018)

The respondents are likely to recommend a type of toilet to a friend of relative, 44% would recommend the Improved VIP latrine. 35% can recommend Choo safi brand while 17% would recommend traditional pit, with only 1% recommending other types of toilets



Source Researcher (2018)

Figure 8 Type of toilets households can recommend to a friend or relative

Product Prices and preferred modes of payments

From the above findings, 4.3.2 on type of toilet owned and how it was acquired, majority have traditional pit latrine that are self-developed. This findings indicates that most of these self-made latrines 37% cost above 10, 000 Kenya shillings, 28% cost between 20,000 and 35,000 only 7% have been able to construct a toilet that costs above 40,000 Kenya shillings. For this reason, majority of households would prefer other modes of payment for a toilet other than cash. Only 21% prefer cash payments, 37% prefer instalments, 25% would be willing to take loan while 17% would prefer being given the product on credit

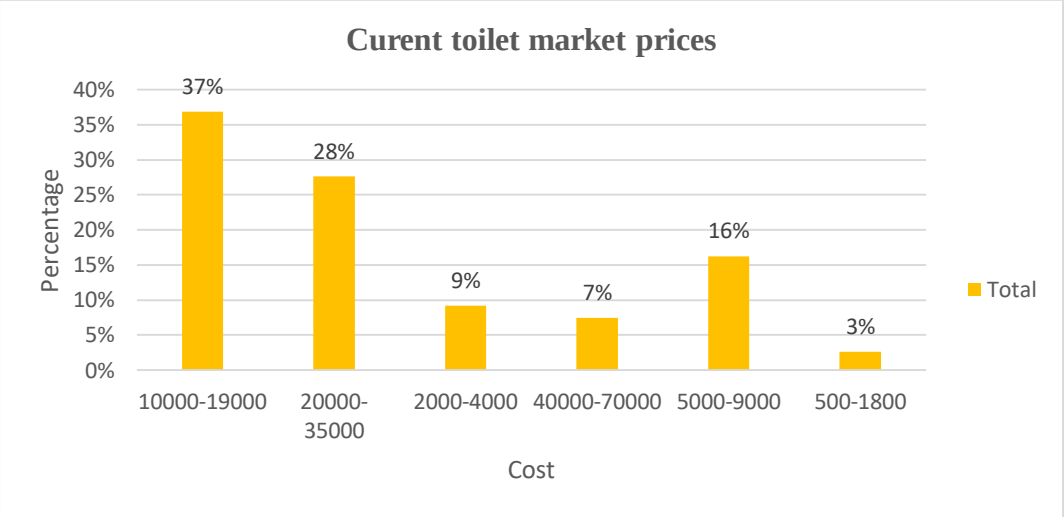


Figure 9 percentage of cost of current toilets owned by households

Source Researcher (2018)

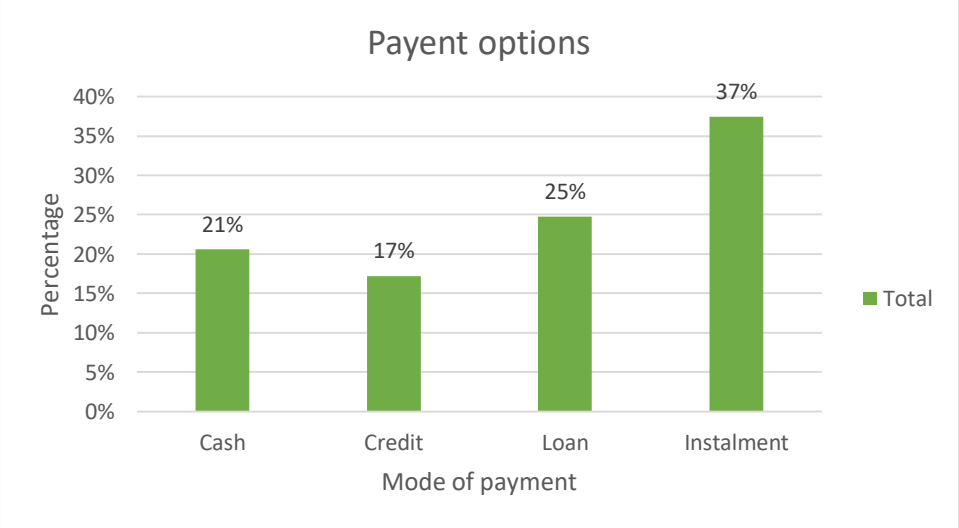

Figure 10 percentage of mode of payments preferred by households

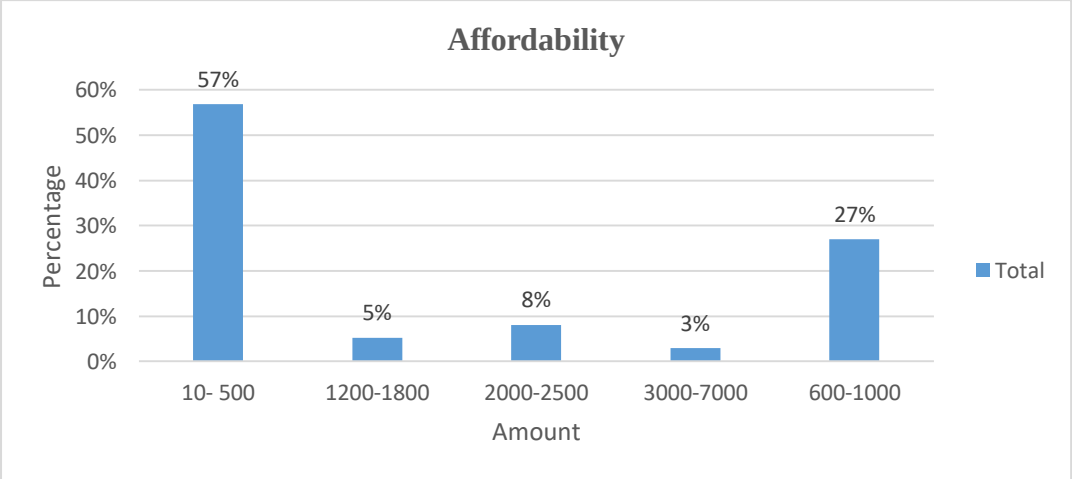
Source Researcher (2018)

As much a people want flexible payments for a toilet, 57% can afford 500 Kenya shillings and below, 27% can afford between 600 and 1000 Kenya shillings per month. This means 57% of the population can afford a toilet worth 6,000 Kenya shillings per year while 27% can afford a toilet worth 12,000 Kenya shillings per year. Based on the current cost of improved toilets in the market ranging from

25,000-70,000 Kenya shillings, such households would take 4-12yrs saving or paying for improved sanitation.



Source Researcher (2018)

Figure 11 Amount households can afford to pay per month for a toilet

Promotional outreach and channel analysis

Most households, 92% have been reached with information. 35.4% have been reached through community meetings, 26% through direct sales representatives, and 15% through GoK officers, 12% have been informed by friends and relatives. Very few households got information through TV 8% direct marketing 2.9% brochure 0.3%. There was no respondent who got information through social media (Facebook and twitter). This can be attributed to the fact that the research was conducted in rural areas where most households lack access to TV and internet. It is evident that private sector is doing very little in promoting adoption of improved sanitation

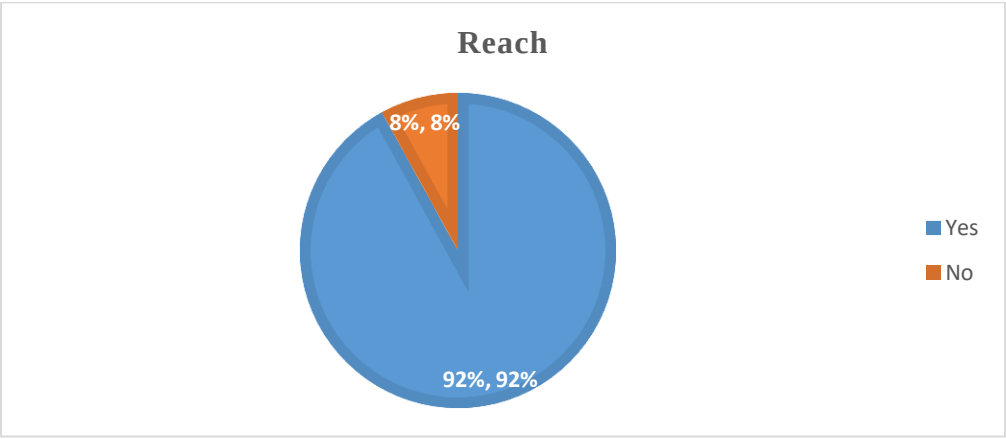


Figure 12 percentage of people reached with information on improved sanitation

Source Researcher (2018)

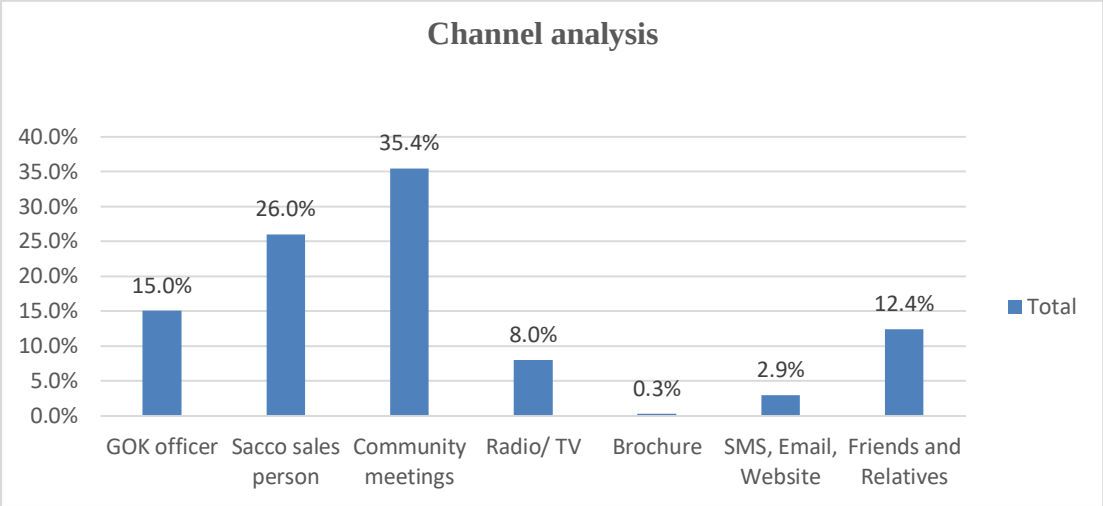

Figure 13 Percentage by channel by which households were reached with information

Source Researcher (2018)

Most households 60% are aware of Choo Safi as a toilet brand, 24.9% are aware plastic slab, 9.% are aware of Improved VIP as a brand while 5.7% are aware of ECO toilet

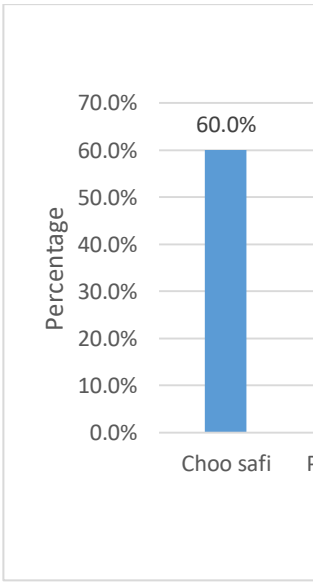

Figure 14 Brands of toilets that households are aware of

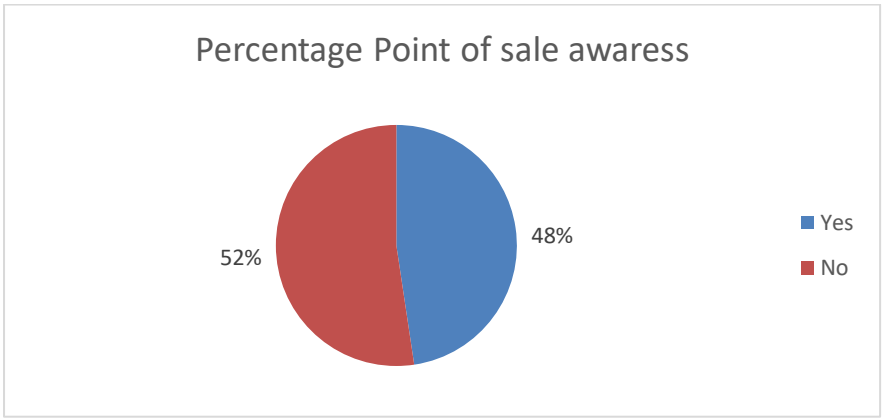
Source Researcher (2018)

Distribution Channels and Point of Sale analysis

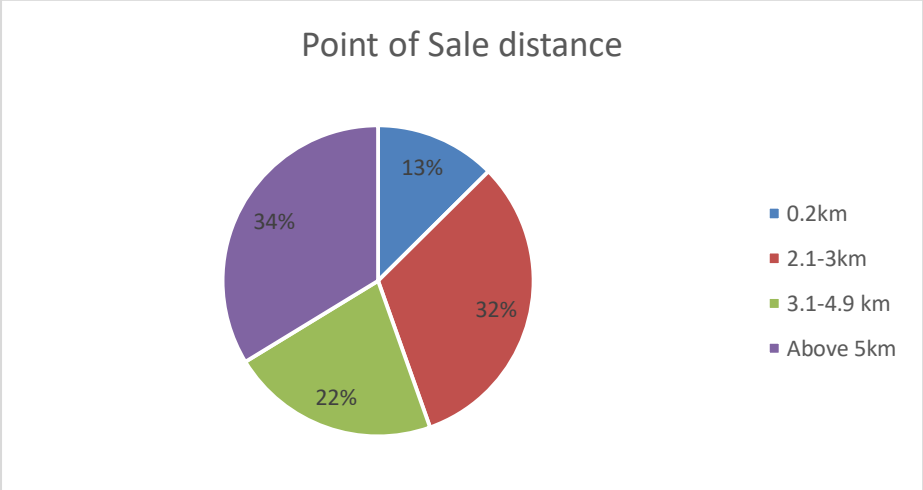
Only 48% of the households knew where to buy a toilet at the time of the survey, 34% live in an area of a distance above 5km radius, this product in considered not easily available to this population. The rest of the population can be considered to have ease of access to the market, 32% live within 2.1 to 3km radius, 22% live within 3.1 to 4.9 km radius, and 13% live within 0.2km radius from point of sale

Figure 15 percentage of households who know where to buy a toilet



Source Researcher (2018)

Figure 16 percentage of households within a given distance from toilet point of sale



Source Researcher (2018)

Most Households lived within a reasonable distance from the point of sale of Latrines materials and toilets. 30% of the households approximated the cost of transport to be between 700 to 1400 Kenya shillings, 22% approximated the cost to be between 100 to 500 Kenya shillings. While 18% approximated 1500-2500 Kenya shillings, 16% put their transport cost at 3000- 5000 Kenya shillings and 9% put it between 11000 to 17000 Kenya shillings.

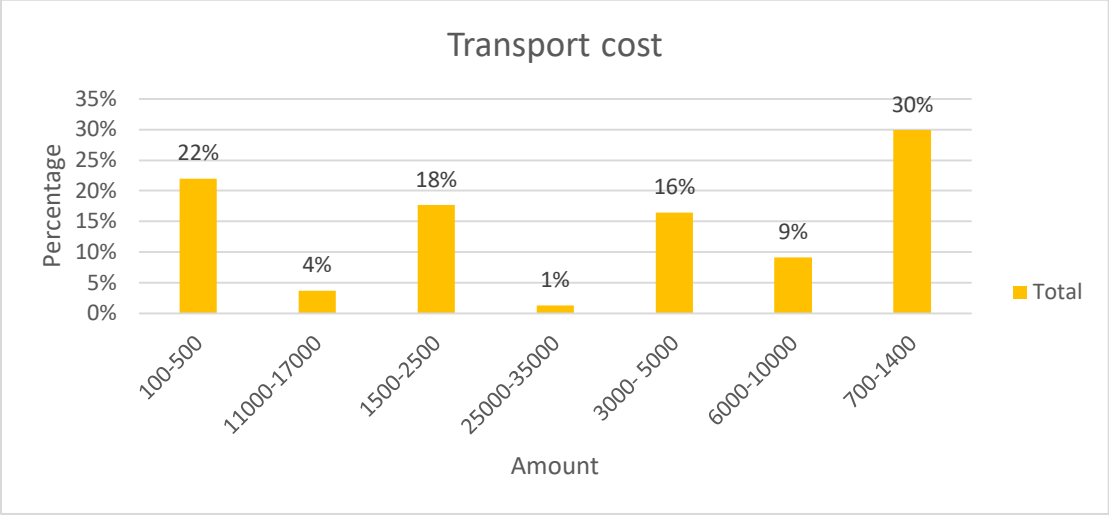


Figure 17 Percentage of amounts households pay for transport of material from point of sale

Source Researcher (2018)

This implies that distance from point of sale is likely to increase the cost of transport by up to 17,000 Kenya shillings. This is likely to discourage adoption of improved sanitation. This calls for intensified distribution to reduce on the cost of transport to the end user. There is need for research on the ultimate cost to the producer if they intensify the distribution channels how it affects prices and profit margins

Descriptive statistics

This section presents the analysis for descriptive statistics for the various variables in the study. It describes the statistics for product attributes, price, promotion, distribution and finally the dependent variable (adoption)

Descriptive statistics for Product Attributes

The first objective was to determine the effect of product attributes on adoption of improved sanitation among rural households in Magarini. The households were asked to indicate to what extent would the features below influence your decision to choose a type of toilet, from a scale of 1-5 with 1 = not at all 2= a little 3= moderately 4= large extent 5= very large extend

Table 1 Descriptive statistics for Product Attributes

Product attributes

	not at all	a little	moderately	large extent	very large extent	Mean	Standard Deviation
Durable	4.4%	13.9%	19.9%	40.2%	21.6%	3.61	1.10
Easy to clean	6.6%	12.8%	33.1%	26.8%	20.8%	3.42	1.15
Safe to Use	5.5%	12.1%	29.9%	31.2%	21.4%	3.51	1.12
Attractive	6.0%	13.9%	33.3%	27.9%	18.9%	3.40	1.12
The design Easy access and use	3.8%	9.8%	33.1%	29.0%	24.3%	3.60	1.07
Does not smell	3.8%	6.3%	27.3%	37.4%	25.1%	3.74	1.03
Does not attract flies	3.0%	12.0%	20.8%	34.2%	30.1%	3.76	1.10
Aggregate mean						**3.577**	**1.09**

The findings indicate that the following latrine/ toilet attributes would influence their product choice to a large extent. These are:- a toilet that does not attract flies 3.76 mean, that does not smell 3.74 mean, a toilet that is durable 3.61 mean a design that is easy to access 3.6 mean, and finally a toilet that is safe to use 3.5 mean. Product attractiveness and easy to clean are some of the attributes that would moderately influence households decision with a mean of 3.4 and 3.42 respectively. The aggregate mean 3.577 indicates that product attributes are likely to affect the choice of a toilet by rural households to a large extent. This implies that during product design, all these attributes are equally important to the customer.

4.4.2 Descriptive statistics for statistics for Price

The second objective was to determine the effect of price on adoption of improved sanitation among rural households in Magarini. The households were asked to indicate what extent they agreed with various price characteristics that are likely to influence adoption of improved sanitation , from a scale of 1-5 with 1 = not at all 2= a little 3= moderately 4= large extent 5= very large extend

Findings indicate that respondents agree moderately that provision of credit/ instalment payment and discounts will increase adoption of improved sanitation with a mean of 3.01, and 2.9 respectively. Households have moderately agreed that: - high prices of improved sanitation is one of the barriers to adoption (mean of 2.50), that they are willing to purchase improved sanitation (mean 2.77), that they able to purchase improved toilets at the current price with (mean 2.65), they also expect the prices to come down in the near future with (mean 2.68) and they are waiting for this prices to come down so that they can purchase improved toilets (mean 2.68). From the findings, households agreed moderately that most people have been offered discounts on toilets. It is clear that improved sanitation is not affordable as indicated by most respondents agreeing a little that improved sanitation is affordable (mean 2.3). The aggregate mean 2.668 indicates that product pricing is moderately influencing adoption of improved sanitation in rural areas. In order to increase adoption, the private sector will need to consider designing products that are affordable to rural households.

Table 2 Descriptive statistics for statistics for Price

Price characteristics

	Mean	Std Dev
Improved sanitation is affordable in this area	2.30	.91

High Prices is the main reason to why most people do not have improved sanitation	2.50	.95
I expect the price of improved toilets to come down in the near future	2.68	1.47
I am waiting for the price of improved toilets to reduce before I purchase/ construct one	2.68	1.00
I am able to purchase/ construct improved sanitation at the current market prices	2.65	1.04
I am willing to purchase/ construct an improved toilet at the current market prices	2.77	1.05
Most people have been offered price discounts on purchasing/ constructing improved toilet	2.51	1.15
Discount on prices will increase the number of people purchasing improved toilets	2.91	1.14
Provision of credit/ instalment payments will increase the no. of people who are able to adopt improved toilets	3.01	1.93
Aggregate Mean	**2.6677**	**1.182222**

Descriptive statistics for Promotion

The third objective was to determine the effect of promotion on adoption of improved sanitation among rural households in magarini, the respondents were asked to indicate to what extend have various channels influenced their decision to choose a type of toilet, from a scale of 1-5 with 1 = not at all 2= a little 3= moderately 4= large extent 5= very large extend

Findings indicate that most respondents agree moderately to have been influenced by: - community meetings (mean 2.95) government officer (mean 2.93), they also agree a little that they have been influenced by other channels like: sacco sales agent (mean 2.25), friends and relatives have also influenced each other a little (mean 2.31). Other channels have also influenced households a little in the choice of a toilet though with a lower mean than the sales agent and friends and relatives. TV/radio (mean 1.74), social media and direct marketing (mean 1.72), Brochure (1.64). This indicates that community meetings and government officers are some of the best channels in marketing improved sanitation products in rural areas in Kenya. It also indicates that direct sales representatives, word of mouth by friends and relatives can play a role in influencing adoption of improved sanitation. The aggregate mean indicates that promotion has a little effect on adoption of improved sanitation, this could be influenced by the lower mean of the other channels of communication that are not common in rural Kenya,

Table 3 Descriptive statistics for Promotion

Promotion channels

	Mean	**Standard Deviation**
I have been influenced by (GoK officer)	2.93	1.12
I have been influenced by (SACCO sales person/ artisan)	2.25	1.61
I have been influenced by (Community Meetings)	2.95	1.17
I have been influenced by (radio, tv)	1.74	1.17
I have been influenced by (Brochure)	1.64	1.15
I have been influenced by (SMS, email, website)	1.72	1.27
I have been influenced by (Friends & relatives)	2.31	1.35
I have been influenced by (Facebook, twitter…etc)	1.72	1.31
Aggregate mean	**2.1575**	**1.26875**

Descriptive statistics for Distribution

The fourth objective was to establish the extent to which product placement affects adoption of improved Sanitation among rural households in Magarini, the respondents were asked to what extend they would you rate the Availability/Accessibility of these improved sanitation construction materials

and components (slabs, concrete rings etc) and also, to what extend they agreed with some statements in relation to how convenient it is to buy a toilet from different types of distributers to a scale of 1-5 with 1 = not at all 2= a little 3= moderately accessible 4= large extent accessible 5= very largely accessible . This findings were split into two different table, the availability of materials and the ease and convenience of buying from various agents and distributers

Findings indicate that, households agree moderately that: - materials for traditional pit latrine are easily available (mean 3.03), Choo Safi materials (Mean 2.65), plastic slabs (mean 2.54). Households also agreed a little that ECO toilet materials (mean 2.37) and VIP latrine material (mean 2.35) are easily available. The aggregate mean indicates that the distribution of latrine construction materials/ components moderately influences the adoption of improved sanitation (mean 2.588)

Table 4 Descriptive statistics for Distribution

Availability of materials

	Mean	**Standard Deviation**
Traditional pit materials are easily available	3.03	1.03
VIP materials are easily available	2.35	1.04
Choo safi materials are easily available	2.65	1.03
Plastic slab materials are easily available	2.54	1.07
Eco toilet materials are easily available	2.37	1.18
Aggregate Mean	**2.588**	**1.07**

Table 5 Descriptive statistics for Distribution point of sale

Point of sale characteristics

	Mean	Standard Deviation
It is easy to buy a toilet from Magarini Artisan Sacco	2.21	.92
It is easy to buy a toilet from Any Artisan in the community	2.20	.98
It is easy to buy a toilet from Community Health Volunteer (CHV)	2.62	1.01
It is easy to buy a toilet from Hardware Shop	2.23	1.03
It is easy to transport construction material/ components from point of sale to my homestead	2.16	1.00
Distance from the point of purchase to homesteads has affected the adoption of improved toilets	2.63	1.03
The cost of transporting improved sanitation materials has discouraged people from purchasing/ constructing improved sanitation	2.62	1.07
Aggregate Mean	**2.381**	**1.0057**

Findings indicate that households have a greed moderately that distance of households to point of sale and the cost of transport have affected the adoption of improved sanitation, with a mean of 2.63 and 2.62 respectively. They have also moderately agreed that it is easier to buy a toilet from community health volunteers as compared to other agents. This could be due to high presence of this volunteers up to village level. Households agree a little that it's easier to buy toilets from the following channels: - hardware shop mean 2.23, Magarini artisan sacco mean 2.21, any artisan in the community mean 2.20. They also agreed a little that it's easy to transport latrine construction materials/ components (mean 2.16). This findings also indicate that community health volunteers could be the ideal distributers of improved sanitation products in rural areas but distance and cost of transport could be challenges they are likely to face. The aggregate mean 2.38 indicates that the choice of distribution agents affects the adoption of improved sanitation a little.

Descriptive statistics Adoption

The general objective was to find out the relationship between marketing mix on adoption of improved sanitation. Adoption was measured by already purchased, the intention to purchase or ability to recommend to someone

Table 6 Descriptive statistics Adoption

Adoption characteristics

	Mean	**Standard Deviation**
Most people in this community have adopted improved toilets	2.46	.83
Improved sanitation is a priority among the things I want to purchase soon	2.65	.93

I have plans to purchase/ construct improved toilet	2.70	1.00
I have started saving money/ making payments in instalments towards purchasing improved toilet	2.41	1.11
I have been able to recommend improved toilet to a friend/ neighbor	2.52	1.06
I can recommend improved toilet to a friend/ neighbor	2.72	1.12
Aggregate Mean	**2.577**	**1.008**

Findings indicate that households agreed moderately that: - improved sanitation is a priority (mean 2.65), that they have plans to construct/ purchase improved toilets (mean 2.70), that they can recommend a toilet to a friend/ relative (mean 2.72) and they have been able to recommend improved sanitation to friends and relatives (mean 2.5). Households agreed a little that: - most people have adopted improved sanitation (mean 2.46) and they have started making savings / instalment payments towards purchasing improved sanitation (mean 2.41)

Inferential statistics

Through inferential investigation, a Multiple Regression analysis was conducted to establish the relationship between the 4Ps of marketing (Product price, Promotion and placement) and adoption of improved sanitation in rural areas.

4.5.1 Regression

The study used multiple regression analysis to establish the relationship between product attributes, price characteristics, promotion channels, distribution and adoption of improved sanitation among households in Magarini sub-county, Kilifi County.

Table 7 Regression

Model Summary

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	.779[a]	.663	.671	.29978

Findings indicate that the coefficient of determination (R-Square Value) is 0.663. This means that product attributes, price, promotion and distribution can explain up to 66.3% of adoption of improved sanitation in rural areas in Magarini, Kilifi County.

Variance Analysis

Table 8 Regression variance analysis

ANOVA[a]

Model		Sum of Squares	df	Mean Square	F	Sig.
1	Regression	110.909	4	27.727	308.532	.000[b]
	Residual	32.532	362	.090		
	Total	**143.442**	**366**			

The results indicate a P-Value of 0.000, this means that the model obtained was significant. This is less than 0.01 and 0.05, which implies that at 5% significance level, the marketing mix is useful in predicting adoption of improved sanitation among rural households. The table below provides both unstandardized and standardized model coefficients which explain the direction of the independent variables and the level of significance of each variable

Table 9 Independent Variable Regression Coefficients

Independent Variable Regression Coefficients

Model	Unstandardized Coefficients		Standardized Coefficients	t	Sig.
	B	Std. Error	Beta		
(Constant)	.520	.079		6.568	.000
Averageproduct attribute	.023	.023	.030	.996	.020
Averageprice Characteristics	.546	.038	.406	14.405	.000
Averagepromotion	.144	.020	.194	7.389	.000
Averagedistributed	.530	.032	.530	16.327	.000

Findings show that all factors held constant at zero marketing mix interventions, adoption of improved sanitation in Magarini, Kilifi County will be at 0.52. All coefficients for product, price, promotion and distribution are positive, this implies that the marketing mix has a positive effect on adoption of improved sanitation. An increase in desirable product attributes can increase adoption by 0.023, an increase in price discounts, payment options, and a reduction in prices will increase the adoption of improved sanitation by 0.546. Similarly, an increase in promotion activities will increase adoption of improved sanitation by 0.144. Finally an intensified distribution channels through agents will increase adoption of improved sanitation by 0.53. All variables have a level of significance of 0.000 which is less than 0.05 except product attribute which has a significance level of 0.02. This implies that the 4Ps (Product, Price, promotion and placement) are within 5% level of significance in explaining adoption of improved sanitation in Magarini, Kilifi county

Conclusions

The research sort to establish the relationship between marketing mix and adoption of improved sanitation. The marketing mix has an influence on adoption of improved sanitation in rural Magarini, Kilifi County. All the 4Ps (product attributes, price, promotion, placement) have a significant effect on adoption of improved sanitation among households in rural Magarini.

From the findings, research has concluded that there is a potential market for improved sanitation, but the current products in the market are not affordable to the community. An affordable product to the majority would cost at least 6,000 Kenya shillings. It is also clear from the findings that community meetings are the ideal channels of communication in rural Magarini and that friends and relatives have an influence on adoption of improved sanitation.

Recommendations

This research recommends that product attributes like durability, ease to access, no smell, no flies, safe to use, attractive, easy to clean be considered in any improved sanitation product. It is recommended that flexible payment options for improved sanitation products be introduced in order to increase adoption. This research also recommends that community meetings be adopted as a major channel of communication for promoting improved sanitation, but should be supported by other channels. Finally it is recommended that sanitation products be distributed by community health volunteers as sales agents

Recommendations for further research

There is need for further research to develop or Identify an affordable improved toilet that meets the desired product attributes for rural households below the bottom of the pyramid. There is also need for research to establish the effect of intensified product distribution on profit margins of enterprises selling sanitation in rural areas

ABSTRACT

The study sought to investigate the relationship between environmental responsibility, and the organizational performance of Total Kenya Limited. The study was anchored on the theory of fiduciary capitalism, stakeholder's theory,Theory of Social Costs, and Carroll´s Pyramid of Corporate Social Responsibility. The study adopted an explanatory research design. The study targetedthe 400 employees of Total Kenya Limited to determine the relationship between its various corporate social responsibility practices on organizational performance. A sample of 80 employees established using Slovin's formulae was used in this study. Statistical Package for the Social Sciences was used to code and analyze the collected data. Besides, regression analysis was conducted to determine the relationship between Corporate Social Responsibility practices and organizational performance. The findings of the study revealed that there exists a positive correlation between environmental responsibility on organizational performance. The study concluded that apart from the four variables studied, there are other CSR practices that can be adopted to enhance organizational performance.Therefore, the study recommended that further studies are conducted to establish the other CSR practices. Besides, further studies should be done in other companies in the petroleum industry as well as in other sectors and compare results.

Key words: cooperate social responsibility, organizational performance, petroleum industry, environmental responsibility.

Introduction

Organizational Performance is the ability of a firm to fulfill its mission viastrong governance, a persistent rededication to fulfill set goals, and sound management (Parasuraman, 2012). According to Cater & Pucko (2010),"organizational performance entails recurring activities to establish set organizational goals, monitor progress towards achieving the goals, and making adjustments in order to achieve the goals efficiently and effectively". It is "the measure of standard or prescribed indicators of effectiveness, efficiency, and environmental responsibility" like productivity, cycle time, regulatory compliance, and waste reduction. Venkataraman & Ramanujam (2001) considered performance as "the metric relating to how a particular request is handled, or an act of performing or doing something successfully using knowledge compared to merely possessing it". Performance is a result of all the firm's strategies and operations.

Marrewijk (2003) defined "corporate social responsibility"as Company activities that are voluntary and demonstrate the inclusion of environmental and social concerns in business operations as well as in interaction with stakeholders. McWilliams, Siegel & Wright (2006) defined CSR as "actions that appear to further some social good, beyond the interests of the firm and that what is required by law." Therefore, CSR activities are voluntary actions that go beyond the legal requirements and the organization's interest to promote social good in society (McWilliams & Siegel, 2001). It involves the treatment of all the stakeholders in a responsible and ethical manner (Hopkins, 2003).

Environmental sustainability initiatives by corporates focus on reducing greenhouse gases and limiting pollution. With increased awareness of environmental issues, businesses that take initiative to reduce land, air, and water pollution can improve their standing as good corporate citizens as well asbenefit the entire society. The global concerns on environmental issues have made many companies focus on the environmental area of CSR (Krohn, 2018). In this study, environmental conservations such as tree planting and awareness campaign on environmental issues will be used as indicators of environmental sustainability initiatives.

Total Kenya Limited is"one of thetotal groups of companiesan international energy producer and a leading international oil and gas company. Globally, itis alsothe second in ranks among the solar energy operator with sun power. The Group isthe leader in Africa with an estimated market share of 18%. TotalKenyaLimited is deeply established in Kenya with long-term investments totaling to multi-billions of shillings. The companyhas been operating in Kenya for over six decades. It was the first oil company to be quoted on the Nairobi Securities Exchange and is a key part of Kenya's essential services infrastructure". Besides, it is one of Kenya's largest revenue generators (Total Kenya Limited, 2016).

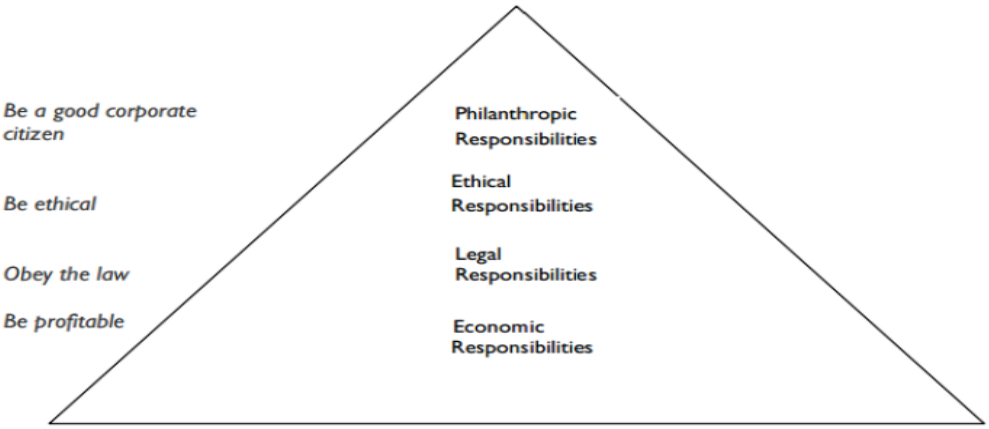
The core business of total in Kenya is the"marketing and distributing of petroleum products and related services to industry, commercial, transport, and domestic users throughout Kenya. Its mainstream fuel products include petrol, diesel,LiquidPetroleum Gas (LPG), both Illuminating kerosene and Jet A1,dual-purpose kerosene (DPK), aviation fuel (Avgas), and industrial diesel.

2.0Literature review

The proponent of the Fiduciary Capitalism Theory of CSR is Friedman. According to Friedman and Friedman (1962), the theoryholds that the "only social responsibility of businesses is to make a profit and, in the supreme goal, to increase the company's economic value for its shareholders. This is the theory that underlies traditional neoclassical economic theory, primarily concerned with shareholder utility maximization. The Nobel laureate Milton Friedman, with his wife Rose Friedman, said that In such an economy, there is one and only one social responsibility of business; to use resources and engage in activities designed to increase its profits so long as it stays within the rules of the game, which is to say, engages in open and free competitions, without deception or fraud".

This theory is applicable to this study as it links corporate social responsibility to organizational performance. Even today, it is commonly accepted that in certain conditions, the satisfaction of social interest leads to shareholders

value maximizing. Therefore, large corporates pay attention to CST especially in considering the interest of the stakeholders (Jensen, 2000).



Source: Carroll(1991).

The theory of Carroll's pyramid of corporate social responsibility was proposed by Carroll's in 1991. It is the most common theory of CSR(Carroll, 1991). The model shows the levels of CSR ranging from philanthropic, ethical, legal and economic responsibilities. These four perspectives can be represented as a pyramid (Pandey, 1999) as shown in figure 2.2.

Economic responsibility is based on profits serving as a foundation of all other aspects in the pyramid. Legally, a firm is expected to adhere to rules and regulations(Santiago, 2004. The model shows that ethical tasks are defined by societal expectations on the organizational embracement of societal values and norms. Philanthropic responsibilities relate to corporate citizenship through support to the community with the purpose of an improved life quality(Carroll, 2016). This theory was relevant to the study as it help the management to understand the level of CSR and what is expected at each level. This theory informed the four dependent variables of the study; namely, environmental responsibility, Philanthropic initiatives, Ethical responsibility, and economic responsibility.

The stakeholder theory holds that "the purpose of the firm is to create value or wealth for the stakeholders through converting their stakes into goods and services" (Clarkson, 1995) or to "serve as a vehicle for coordinating stakeholder interests" (Evan &Freeman, 1988). Therefore, an organization should be"managed for the benefit of its stakeholders; that is, its suppliers, owners, customers, employees,and local communities, as well as to ensure the survival of the organization (Evan & Freeman, 1988). The structure of decision-making is based on the top management's discretion and corporate governance". The stakeholder theory of CSR is related to the belief that companies have an obligation to the community other than stockholders and beyond that prescribed by law or union contract" (Jones, 1980). Thus, this theory considers individuals or groups who have a stake in the organization including employees, shareholders,supplier, customers, and the local community as shown in figure 2.2.

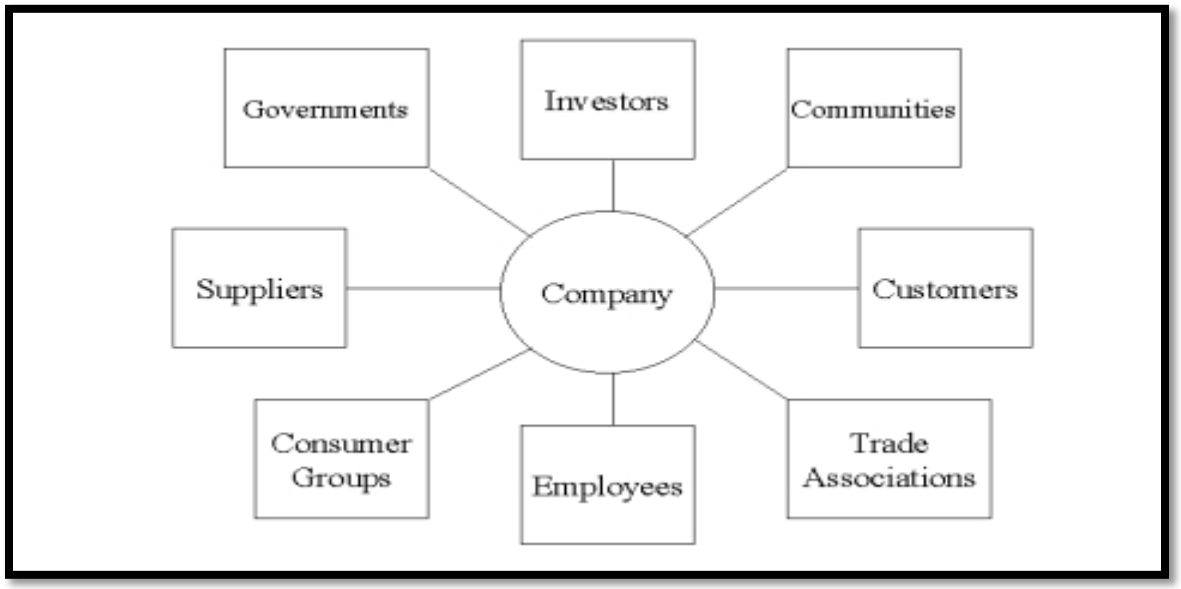


Figure 2. 1:

Stakeholders model of a company

Source Freeman, (1984)

According to Freeman (1984),"the stakeholder concept provides a new way of thinking about strategic management. By paying attention to strategic management, executives can begin to put a corporation back on the road to success. However, it is also a normative theory which requires management to have a moral duty in order to protect the corporation as a whole and, connected with this aim, the legitimate interests of all stakeholders (Friedman, 1970). Evan and Freeman (1988) stated that management, especially top management, must look after the health of the corporation, which involves balancing the multiple claims of conflicting stakeholders".

Friedman (1970)the term stakeholder meant to generalize the notion of stockholdersasthe only group to whom management need to be responsible. 'Stakeholder' can be taken in two senses. In a narrow sense, the term stockholder includes "those groups who are vital to the survival and success of the corporation" (Freeman and Reed, 1983). In a wide sense, it includes "any group or individual who can affect or is affected by the corporation" (Freeman, 1984). Thus, "stakeholders are identified by their interests in the affairs of the corporation and it is assumed that the interests of all stakeholders have intrinsic value" (Donaldson and Preston, 1995).

The stakeholder's theory is relevant to the study on the basis that the community is part of the firm's stakeholders whose interest is addressed in corporate social responsibilities. This theory informs the independent variable of the study; organizational performance and ethical responsibility. The theory holds that the purpose of the firm is to create value or wealth for the stakeholder which is only achievable through performance. The theory informs the variable, ethical responsibility in that it is a management theory based on the moral treatment of stakeholders (Harrison, Freeman & Abreu, 2015).

Marshall and Pigou proposed the theory of social costs in 1920 (Marshall, 1920) argued that the focus of corporate non-economic effects on the social economy is the basis for responsible allocation. In other words, the theory of social cost holds that the problem of modern corporate responsibility deals with the fair allocation of social costs. Some problems arise in the literature concerning the study of "eternal economies." According to Marshall (1920), "external economies need to be secured by the concentration of many small businesses of a similar character in specific localities or by the localization of industry". The location of small enterprise is considered a matter of exogenous advantage when they can be placed among a cluster of similar enterprises (Marshall, 1920).

According to Pigou (1920), “the issue of social costs relates to the organization originating the costs and to their coverage. Of the two, the latter produces a huge debate (Meade, 1973). Based on the fact that the problem relates to justifying state intervention in the economy and making it easier to reach a ‘natural’ equilibrium, this assumption has crucial consequences regarding social responsibilities. The state’s role in the economic system aims to cover social costs and may be intended as the state assuming responsibilities to preserve the national product and its citizens’ welfare.

Therefore, its natural counterpart should be that of leaving no responsibilities to the firm that produces the cost even if indirectly or involuntarily. This issue makes it clear that paying for social costs is a matter of contracting and that it has to be assumed by either the firm or by the state (Coase, 1960). From a different perspective, Coase (1960) tries to shift the issue to corporate production factors”. The main thesis is that the “costs of the transaction between citizens and government determine whether the state intervenes in the economy or not” (Coase, 1988). Paying for social costs is a matter of contracting. The theory of social cost is relevant for the study since firms affect the environment around them leading to social costs, which is what corporate social responsibility tries to compensate to the community.

2.1Empirical Literature Review

There is various empirical literature on the relationship between environmental responsibility and the firm’s performance. Ngwakwe (2008) researched “environmental responsibility and firm performance in Nigeria”. He used a field survey methodology and a sample of sixty manufacturing companies in Nigeria. The findings showed that there exists a positive relationship between an environmentally responsible and firm’s performance. However, this study usednon-random methods of sampling that is, a purposive sampling technique that may have yielded a sample that is not representative and thus the findings may not be generalized. Ngwakwe (2008) used employee health and safety, waste management, and community development as indicators of firm performance. However, the current study will use Customer satisfaction, Employee satisfaction, and Sales growth as the indicators of firms’ performance.

Clause & Pall (2011) studied the “effect of the environmental investment on investment decisions”. They suggested that environmental information disclosure affects investment allocation decisions. These findingsimplied that “companies that are apathetic to their environmental responsibility might experience eventual crashes on their stock price if their investors are rational in considering the future value of the firm based on its present state of environmental responsibility”(Clause & Pall, 2011). While this study focused on environmental responsibility, it used decisions made to invest in the firm as an indicator of performance. This may not be the best way of measuring a firm’s performance since there could be other reasons why Investment decisions are made by investors including the management intention to allow external investors.

Lars & Henrik (2010) investigated the “effect of environmental information on the market value of listed companies in Sweden using a residual income valuation model”. The findings indicated that environmental responsibilities as disclosed by sampled organizations have value relevancebecause it is expected to affect the future earnings of the listed firms. Their finding implies that the future solvency of organizations that do not take care of the environment may be eroded with gradual depletion in earnings. The focus of this study was the provision of environmental information which can be done by a company that does not practice CSR activities; hence the findings cannot be used to generalize the relationship between environmental responsibility and firm performance.

Okwemba, Chitiavi, Egessa, Douglas & Musiega (2014) investigated the“effect of corporate social responsibility on organization performance in the banking industry in Kenya”. The findings show that there is a significant positive but weak relationship between organization performance and environmental activities. This implies that a bank has been involved in environmental activities such asthe use of renewable energy, good waste management, obey local and international laws on environmental will increase its performance but not significantly. This study was limited to the banking industry and not the petroleum industry and measured firms’ performance using profitability, a financial measure. The current study will use non-financial measures of firm performance. Yang, Hong, & Modi (2011) studied the “impact of lean manufacturing and environmental management on business performance”.Within

their study, environmental management practices were measured against financial and market performance. Yang, Hong, & Modi (2011) discovered that there existed a negative relationship between the two variables.

3.0Research Methodology

Explanatory design was adopted for carrying out an in-depth, holistic and comprehensive investigation with much emphasis on the relationship between environmental responsibility and organizational performance of Total Kenya Limited.

Kombo &Tromp (2006) defines a population as "a group of individuals, objects, or items from which samples are drawn for measurement". It is an entire group of people or elements that at least share one thing in common. The study targetedthe 400 employees of Total Kenya Limited to determine the relations between its various CSR practices on organizational performance. The 400 employees comprised of 50 top-level management, 100 middle-level management, and 25 subordinate staff as shown in Table 3.1.

Table 2: Target Population

"Employees	**Target population**	**%**
Top level management	50	12.5
Middle level management	100	25.0
Subordinate staff	250	62.5
Total	**400**	**100"**

Source: Total Kenya (2019)

Marczyk, DeMatteo & Festinger (2005) described a sample as "a subset of the population to be studied". The main advantages of using sampling are reduced costs, enhanced speed,andaccuracy,as well as increasedquality of the data (Ader, Mellenbergh, & Hand, 2008). The researcher adopteda simple random and stratified sampling technique to select a representative sample for the study. First, stratified sampling was applied to classify the population into three categories of targeted population; namely subordinate staff, top-leveland middle-levelmanagement. The list of employees who works atTotal Kenya Limited formedthe sampling frame of the study. Second, simple random sampling methods were used to select the sample. All employees on the sampling frame were assigned a specific number, and the table of random number was used to select the appropriate sample.

To come up with the sample from the population, Slovin's formula was used. The Slovin's formula is written as follows

$n = \frac{N}{1+N(e)^2}$; Where N= Target Population; n= Sample size; and e = error tolerance / confidence level.

In the study, N= 400, e = 0.1,

$n = \frac{400}{1+400(0.1)^2}$ = 80

The sample size was 80 respondents comprising of 10 top-level management, 20 middle-level management,and 50 subordinate staff.

Table3: Sample size

Employees	**Target population**	**Rate 80/400**	**Sample Size**

Top level management	50	0.2	10
Middle level management	100	0.2	20
Subordinate staff	250	0.2	50
Total	**400**	**100**	**80**

Source: researcher (2018)

The researcher used questionnaires as the main data collection instrument to collect primary data from the sources. A drop and pick method was used to administer the research questions, where the questionnaires were administered and collected after three days to give the respondents time to fill in.

The questionnaire was categorized into twosections. The first sectionpresented the demographic and general information of the respondents. The second part comprised questions that helped to determine the relationship between environmental responsibilities and organization performance.

To assess the validity of the content and enhance the accuracy of the questionnaire, 5 facilitators were engaged to discuss the questionnaire. Theircontributionswereused to enhance the validity of the research instrument.

In the current study, external validitywasattained byusing the appropriate sample size which helped to attain external validity.

The face validity and construct validity was assessed before using the research instrument. Construct validity was attained as the researcherworked with the supervisor who assessed the logical validity of the questionnaire.

The reliability of the study measures was assessed by computing Cronbach's Alpha coefficient for all items in the questionnaire (Sekaran & Bougie, 2010)". A correlation coefficient greater or equal to 0.7 was accepted.

Table 4: Reliability Analysis

Scale	Cronbach's Alpha	Number of Items
Environmental Responsibility	0.846	6

Source: survey data (2019)

The right procedure was followed when collecting data. First, the research soughtan introduction letter from the University for the purpose of introducing himself to the target population. Second, a research permit from NACOSTI was acquired before embarking on the data collection process. Once the permit is issued; the researcher sought consent and appointment with the management of Total Kenya Limited when schedules for collecting data were agreed upon. Then, on the agreed date, the research instruments was delivered to the sampled respondents after which follow up was done after 3 days to ensure the questionnaires are filled in appropriately. Finally, filled questionnaires were collected from the respondents.

The researcheranalyzed data through quantitative techniques. Descriptive analysis like frequencies, weighted mean, and percentageswill be employed. Weighted mean was calculated by using the aggregated statistical mean of the responses for each variable. Inferential statistics like correlation analysis as conducted to test the correlation between the variables. SPSS was used to analyze data based on the objectives of the study. Frequency and percentage tables were used to presentthe data; toensure that the research findings are easily interpreted for easier understanding.

The study also employed a multiple linear regression model to test the significance of the effect of the independent variables on the dependent variable. The multiple linear regression model will be as shown below.

"$Y = \beta_0 + \beta_1 X_1 + \varepsilon$

Whereby;
Y= Organizational performance
β_0= Constant
$\beta_{1,,}$ = Coefficients of determination
X_1= Environmental responsibility,
ε = Error term"

Relevant procedures were throughout the research process. These included; permission to conduct the study will be obtained from relevant authorities. The principle of informed consent was adhered to; whereby participants were asked to give their consent. Participation in the research was the respondent's choice ;hence, the researcher informed them of the importance of carrying out the research to get their consent. The collected information are confidential and are used for academic research only. The identification of respondents was protected by avoiding showing their names in the final report. Besides, the questions in the questionnaires were carefully structured. The study avoided research misconduct like plagiarism, data falsification, and fabrication.

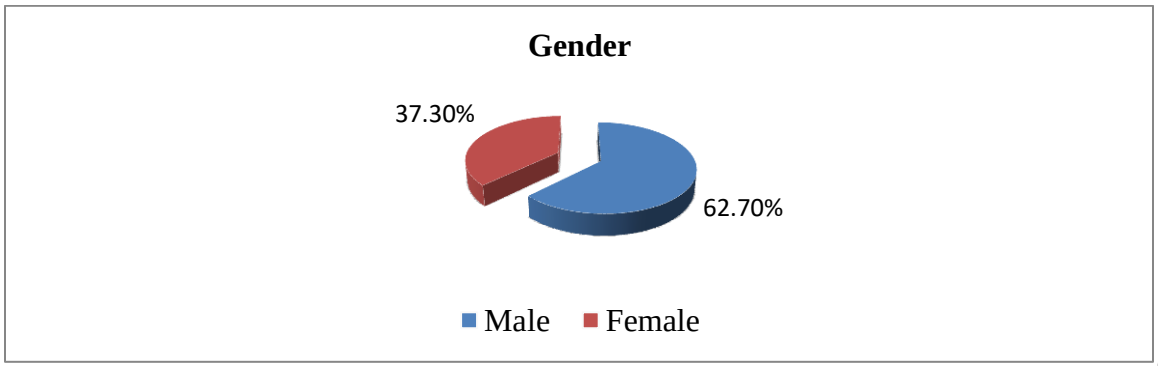
4.0 RESULTS AND FINDINGS

The study targeted a total of 80 respondents among the top level, middle-level management and Subordinate staff in Total Kenya Limited. However, 75 questionnaires were returned duly filled in. This translated to 93.75% response rate. According to Mugenda and Mugenda (2003), a response rate of 50% is adequate for analysis and reporting; a rate of 60% is good and a response rate of 70% and over is excellent. Therefore, this response rate was adequate for this study.

4.3 Descriptive statistics

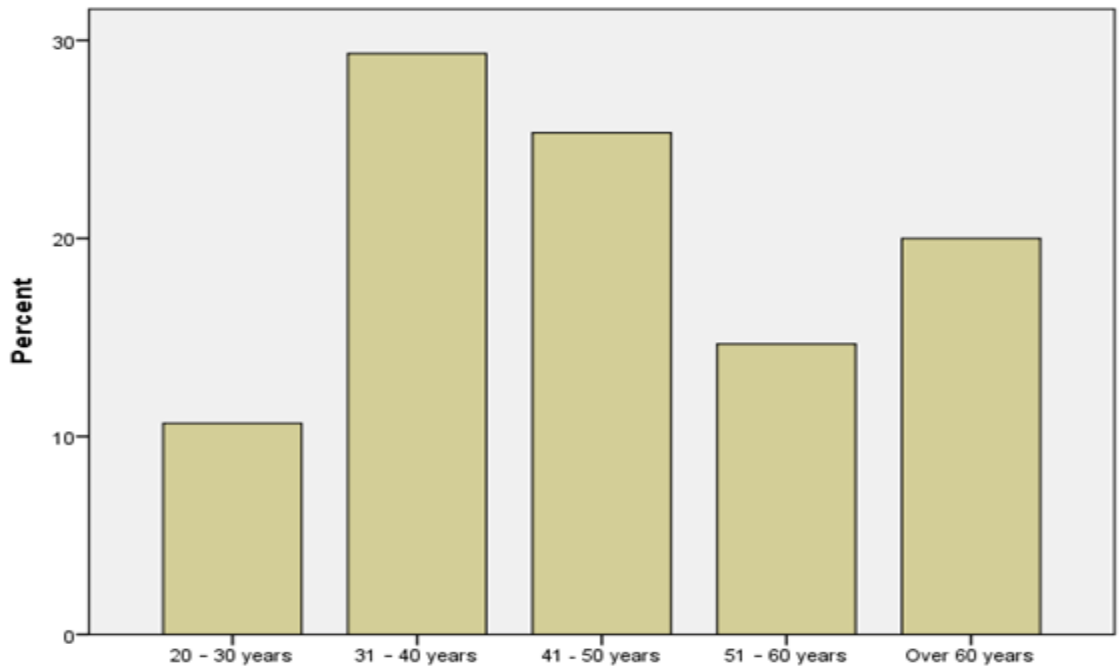
The study sought to establish the background information of the respondents including their gender; age; duration they have worked for Total Kenya Limited; highest level of education and position they hold in the Company. The findings are presented in figures 4.1; 4.2; 4.3; 4.4; and 4.5.

Figure 4. 4: Respondent's Gender



Source: Survey data 2019

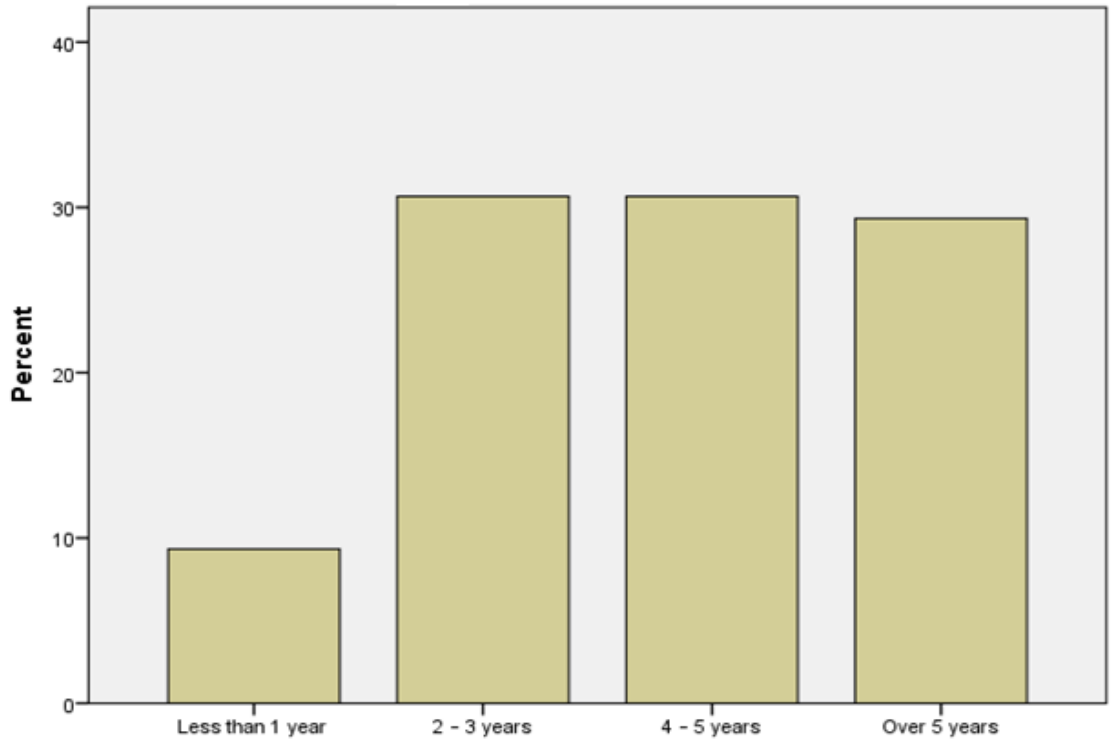
Figure 4. 5: Respondent's Age



Source: Survey data 2019

The study sought to establish the age of the respondents. The results indicated that the majority of the employees of Total Kenya (29.3%) were between the age of 31 and 40 years. Those who were between the age of 41 and 50 years were 25.3% and those who were over 60 years were 20%. Another 14.7% were between the age of 51 and 60 years while 10.7% were between the age of 20 and 30 years. These results indicated that Total Kenya has employed both the youth and elder. This may indicate that the company retains its employees for long and employ the youth as it expands its business.

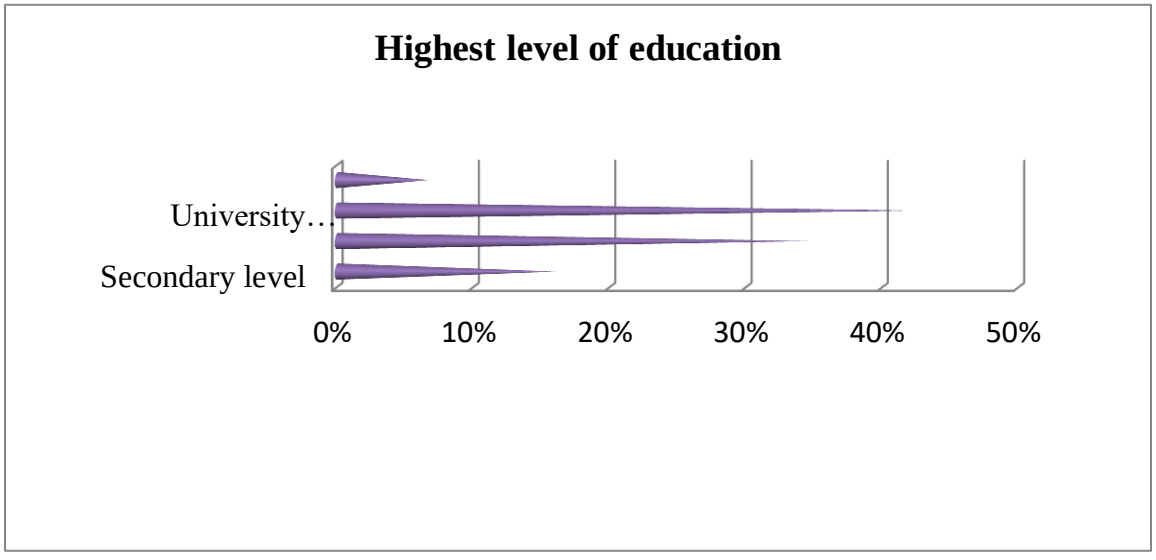
Figure 4. 6: Duration working for Total Kenya Limited



Source: Survey data 2019

The majority of the respondents have been working for Total Kenya Limited for more than 5 years. While 29.3% have been working for the company for over five years, 30.7% has worked between 4 and 5 years and another 30.7% have worked for the company between 2 and 3 years with only 9.3 % who have worked for the company for less than one year. These results confirm that Total Kenya has less employee turnover and it is still recruiting more as it expands.

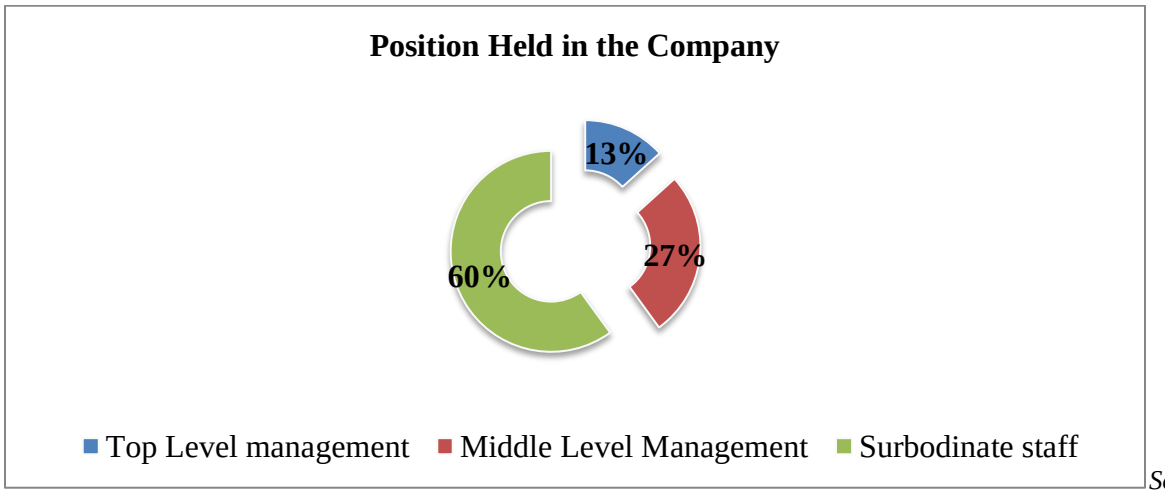
Figure 4. 7: Highest Level of Education



Source: Survey data 2019

The findings revealed that the majority of the respondents (42.70%) had attained university level-undergraduate level of education followed by 34.70% who had attained a college level of education. The respondents who had attained a secondary level of education were 16% and those who had advanced to masters' level were 6.7%. This may suggest that the company encourage personal development of its employees.

Figure 4. 8: Position Held in the company



Source: Survey data 2019

4.4 Environmental Responsibility

Table 4.1 shows respondents responses on various issues concerning environmental responsibility. The majority of the respondents were in agreement where 48% strongly agreed and 37.3 % agreed that the company runs programs aimed to conserve the environments, while 14.7% were undecided. The undecided are perhaps as a result of new recruits since there is quite a number who have worked for Total Kenya limited for less than one year. This implies that some employees may have been unaware of such programs. However, the variations on the responses on these issues were relatively high as shown by a mean score of 4.3333 and a standard deviation of 0.72286. This is because the undecided were quite a number.

Table 4. 1: Environmental Responsibility

Statement	Strongly Disagree	Disagree	Undecided	Agree	Strongly Agree	Mean	Standard Deviation
The company runs programs aimed to conserve the environments	0	0	14.7	37.3	48	4.3333	0.72286
The company has an annual budget for environmental conservation initiatives	0	0	8	60	32	4.2400	0.58909
Regulars awareness campaign on environmental issues are held by the company	0	0	10.7	64	25.3	4.1467	0.58572
The company discloses its environmental costs in the financial statements	0	0	9.3	34.7	56	4.4667	0.66441
The company partners with the government and other partners in environmental conservation initiatives	0	0	14.7	58.7	26.7	4.1200	0.63587

Waste management is a priority for our company	4	5.3	13.3	24	53..3	4.1733	1.10739

Source: Survey data 2019

The findings revealed that the majority of 92% were in agreement that the company has an annual budget for environmental conservation initiatives, with 60% agreeing and 32% strongly agreeing, while only 8% were undecided. This indicated by a slightly low standard deviation of 0.58909. Concerning whether there is regulars awareness campaign on environmental issues held by the company; 64% agreed, 25.3 % strongly agreed and 10.7% were undecided. The majority (56%) of the respondents strongly agreed and 34.7% agreed that the company discloses its environmental costs in the financial statements, which 9.3% were undecided. On the other hand, the majority (58.7%) agreed and 26.7% strongly agreed that the company partners with the government and other partners in environmental conservation initiatives. However, 14.7% were undecided. When asked whether Waste management is a priority for the company, the respondents gave a varying response as shown by a high mean of 4.1733 and high standard deviation of 1.10739. However, the majority were in agreement, with 53.3 % strongly agreeing, 24% agree, 5.3% disagreed, 4% strongly disagreed, and 13.3% were undecided.

The study also sought to establish the respondents' opinion concerning the influence of environmental responsibility

Table 4. 2: Organizational Performance

Statement	**Strongly Disagree**	**Disagree**	**Undecided**	**Agree**	**Strongly Agree**	**Mean**	**Standard Deviation**
Environmental responsibility influence organizational performance	0	0	0	80	20	3.2000	0.40269

ource: Survey data 2019

The results indicated that the respondents unanimously agreed that environmental responsibility Therefore, there is a low variation as shown by high mean of 3.2 and a low standard deviation.

4.10 Inferential statistics

Pearson's product moment correlation analysis was used to assess the relationship between the variables while multiple regressions were used to determine the predictive power between organizational performance and environmental responsibility.

4.10.1 Correlation Analysis

The data presented before on environmental responsibility and organizational performance were computed into single variables per factor by obtaining the average Pearson's correlations analysis was then conducted at a 95% confidence interval and 5% confidence level 2-tailed. Table4.6 shows the results of a correlation matrix

Table 4. 3: Correlation Matrix

		OP	**ER**	**PI**	**ETR**	**ECR**
Organisational performance	Pearson Correlation	1	.150	.066	.150	.253*
	Sig. (2-tailed)		.199	.571	.199	.028
	N	75	75	75	75	75
Environmental	Pearson Correlation	.150	1	.239*	1.000**	.099
	Sig. (2-tailed)	.199		.039	.000	.400

responsibility	N	75	75	75	75	75

The significance values for relationship between organizational performance and Environmental responsibility was 0.199. This implies that environmental responsibility is significant

Table 4. 4: Analysis of variance

Model		Sum of Squares	df	Mean Square	F	Sig.
1	Regression	5.184	3	1.728	4.302	.044[b]
	Residual	53.296	71	.751		
	Total	58.480	74			

Source: Survey data 2019

The significance value is 0.044 which is less than 0.05; hence, the model is statisticallysignificant in predicting how Environmental responsibility affect the organizational performance inthe petroleum industry in Kenya. The F critical at 5% level of significance was 3.23. Since F calculated is greater than the F critical (value = 4.302), this shows that the overall model was significant

Multiple regression analysis was conducted to determine the relationship between Organizational performance and the four variables. Based on the SPSS generated table 4.9 above, the equation

($\mathbf{Y = \beta_0 + \beta_1 X_1 + \varepsilon}$) becomes:

$Y= 13.316+ 0.064X_1$

Based on the established regression equation, when all factors are held constant at zero Environmental responsibility organizational performance would be 13.316. The analyzed data shows that when all other independent variables at Zero, a unit increase in environmental responsibilitywould lead to 0.064 increases in organizational performance

5.0 Conclusions and Recommendations

The study aimed to establish relationship between environmental responsibility and performance of Total Kenya limited. The study established that the company runs programs aimed to conserve the environments. However, a small proportion of the employees were not aware of such program hence indicated they were undecided; perhaps the new recruits. The study also found that the company has an annual budget for environmental conservation initiatives and it carries regular campaign on environmental issues. Further, the study found that the company discloses its environmental costs in the financial statements, and it partners with the government and other partners in environmental conservation initiatives. Besides, waste management was found to be a priority in total Kenya limited. Although the majority agreed on the above, a small proportion representing the new recruits who are not well versed with the operations of the company as well as its corporate social responsibility programs. Regression analysis revealed that there exists a positive correlation between environmental responsibility and organizational performance. This is in support to previous studies by Ngwakwe (2008) and Okwemba, Chitiavi, Egessa, Douglas & Musiega (2014) who found that there is a positive correlation between environmental activities and organizational performance.

The management of other corporate organizations can benefit from the findings of this study in various ways. The recommendations are presented is based on the findings of the study and may be generalized to other companies in other sectors besides, petroleum sector. The study concluded that Total Kenya Limited is committed to conserving the environment in its operations as one of its corporate social responsibility practice. This is a noble course especially at this era where nature is responding to environmental pollution through global warming in various parts of the world. It is, therefore, recommended that the company comes up with more programs meant to conserve the environment as well as campaigns to create more awareness so that other companies in the petroleum and other sectors can join hand in environmental conservation. It is worth noting that when a company makes it clear that environmental responsibility has contributed positively to its organization's performance, other firms including the competitors will follow the same route for the benefit of the environment.

6.0 Recommendation for further studies

The study also concluded that there are other CSR practices that can be used to enhance organizational performance. Thereafter, it is recommended that further studies be done to establish other CSR practices that may be used to enhance organizational performance. This study was conducted at Total Kenya Limited, yet there are also other players in the petroleum sectors. Therefore, it is recommended that further studies are conducted in other companies in the petroleum industry as well as in other sectors and compare results.

Abstract
Compensation and benefits are the most critical factors in attracting and retaining high quality employees. The employees' commitment and motivation are directly tied to this aspect of the employment relationship. Great employers provide generous monetary and non-monetary compensation and benefits to their workforce. Money is considered as the reward which is given to employees against work, to support their family, and payment for the work which is done. The banking sector in Kenya has over the years faced a number of challenges including increasing competition, increased regulation by the government and high rate of technological growth especially the mobile phones that now offer banking services. Managers often use rewards to reinforce employee behaviour that they want to continue. The general objective of this study was to establish the relationship between compensation schemes and employee performance among commercial banks in Kenya. Further, the study sought to find out the effect of commissions and bonus schemes on employee performance among commercial banks in Kenya. The study was guided by the following theories: Expectancy theory, and Herzberg's Two-Factor Theory of Motivation. A descriptive research design was used to gather the information needed to achieve the objectives. The target population was all the 44 commercial Banks consisting of staff members working in the human resources department at top level, middle level and low level management totalling to 336. Stratified random sampling technique was used to generate a sample size of 101 respondents who formed 30% of the target population. A semi-structured self-administered questionnaire was used to collect the data. The data was analysed using descriptive statistics and presented in tables, charts, means and percentages. The study established that. Commission (β=0.179, p=0.030<0.05) had a positive and significant effect on employee performance. Bonus schemes (β=0.171, p=0.015<0.05) had a positive and significant effect on employee performance. The study concludes that incentives had a positive and significant effect on employee performance.

Keywords: Compensation schemes. Commissions, bonus, employee performance

INTRODUCTION

According to Barney and Hesterly (2014), an organizations employee compensation policy and practice is important in implementing a strategy. A company that adopts a compensation policy that is consistent and reinforces its practices is more likely to implement those practices than a firm that adopts compensation policies that are inconsistent with its strategies (Armstrong, 2015). A reward strategy should enhance commitment and engagement and provide more opportunities for the contributions ofpeople to be valued and recognized. According to Rudman (2013) paying for performance is a big issue in contemporary human resources management; organizations have long believed that productivity improve when pay is linked to performance and payment by results systems and incentives are developed to support this belief. Studies have found a positive relationship between performances related pay and performance.

Compensation and benefits are the most critical factors in attracting and retaining high quality employees. The employees' commitment and motivation are directly tied to this aspect of the employment relationship. Practices, which were effective when they were introduced, may degenerate as the organization evolves or it degenerates. Reward management is therefore is not only about money, it is also concerned with intrinsic, as well as extrinsic motivation; with non-financial, as well as financial rewards. This leads to several components of reward management such as strategic reward, job evaluation, Market rate analysis, grade and pay structure as well as contingent pay, (Ripley, 2012).Organizations provide rewards to their personnel in order to try to motivate their performance and encourage their loyalty and retention. According to Luthans and Fred (2014), organizational rewards take a number of different forms including money (salary, bonuses, and incentive pay), recognition and benefits.

Despite the tendency in the recent years to downgrade the importance of pay as an organizational reward, there is ample evidence that money can be positively reinforcing for most people, and, if the pay system is designed properly to fit the strategies, can have a positive impact on individual, team and organization performance. For example, many organizations use pay to motivate not just their upper level executives but everyone throughout the organization.Moreover, these rewards may not always have to be immediately forthcoming. Many individuals will work extremely hard for rewards that may not be available for another 5 or 10 years. Additionally, every permanent employee receives benefits, even though they often seem to be unaware and not know the usually high monetary value of these benefits. In fact, benefits constitute a large percentage of most organizations expenses (Armstrong, 2012).

A study by Kiarie (2015) on selected employees in Mobile Phone Industry concluded that performance is not a major factor while setting compensation schemes for most quoted companies in Kenya. A majority of companies use salaries to compensate their employees with only a small number combining both salaries and bonuses. These salaries are based on grading systems that companies set based on either the education level or the experience of the employees.

Ooko (2013) concluded that employees in the mobile phone industry perceive a link between performance and incentive pay both among the sales persons and technicians. Work, salary and incentives are important to most

employees in the mobile phone industry positively influence satisfaction among employees and the timing of incentives is satisfactory to majority of employees. McNamara (2008) also found that monetary compensation is an essential component in recruitment and retention process; but benefits are equally important and can often be the deciding factor in whether an individual accepts an offer or even stays in the organization.

Huselid, (2011); Dotty, (2016); Goel (2014). People receive extrinsic or intrinsic rewards (Armstrong, 2014), Dessler, 2015, Goel 2014). Extrinsic rewards e.g. pay bonuses, promotions, time off, special assignments, office fixtures, awards and verbal praise are externally administered (Dessler, 2015; Armstrong, 2014).Intrinsic rewards are self-administered (Dessler, 2015).The dynamic state of global business greatly influences how organizations position themselves for performance and profitability. An organization's success is highly dependent on the performance of its employees. Poor employee performance is detrimental to any organization while effective employee performance is a great source of organizational success.

In most organizations, rewards are directly linked to employee performance (Zaman, 2011). Dewhurst et al (2010), defines rewards as both financial and non-financial benefits that are given to employees for good performance at work, or for accomplishing assigned duties, as stipulated in an organizational structure, strategies, policies, and processes. Zaini, Nilufar, and Syed (2012) define employee rewards as tangible financial benefits and services, and other non-tangible benefits given to employees for playing their part in an organization. Richard, Ryan and Deci (2010) say that organizational rewards significantly influence employee performance in organizations.

Employee performance can be defined as the ability of an employee to accomplish his or mission based on the expectations of an organisation (Pierce et al, 2014). It can also be said to be the level to which the employees apply their skills, knowledge and attitudes towards achieving the desired results and meeting the specified objectives, (Rehman, 2012). Bohnstedt & Larsen, (2014) points out that employee performance is often indirectly measured using aspects of employee behaviour at work such as speed, courtesy, etiquette, precision, time management, consistency and influence on other employees.

Performance based compensation is a method of compensation designed to reward employee performance. Performance based compensation may be based on individual and team performance (Gomez, 2013). Gomez-Mejia and Balkin (2013) specify favorable conditions under which performance related compensation is deemed to be favorable and they include; where individual performance can be objectively and meaningfully measured, where individuals are in a position to control the outcomes of their work, where close team working or cooperation with others is not central to successful job performance and where there is individualistic organizational culture.

In Asian countries, rewards have been used for decades to enhance employee performance (Thomas, 2012).Long before multinationals started venturing in Asia, countries like Malaysia, Japan, and Singapore were using reward systems to enhance employee performance. A study conducted by Ali, and Ahmad (2012) on effects of rewards on employee performance in Malaysian hospitality industry established the existence of a relationship between rewards,

motivation, job satisfaction, and performance. The study found that financial rewards were directly related to employee performance as well. Further, they noted that organizations in the hospitality sector should design evaluation systems for rewards that are able to uncover employees' weaknesses and strengths in a specific job, and reward factors that motivate employees towards enhanced performance.

Africa as a continent has used rewards systems from pre-colonial days. However, Africa's pre-colonial employee rewards were not as advanced as the monetary extrinsic systems used in Europe (Dewhurst, Guthridge & Mohr, 2010). Employees who worked in farms received higher rewards when the harvest was bountiful as a way of showing appreciation and recognition.Many studies have shown a positive relationship between HRM strategies and performance in the manufacturing sector (Huselid 2017; Armstrong & Baron, 2012; Katou, 2014; Ahmad & Schroeder, 2013; Bae & Lawler, 2010; Batt, 2012; Delery & Doty, 2016; Guthrie, 2011; Gardner & Moynihan, 2013). Despite these findings most SHRM studies have been characterized by lack of a solid theoretical foundation explaining the mechanisms causing the observed enhanced performance.

Nairobi City County is the County hosting the Capital City of Kenya and therefore most of the headquarters for commercial banks and other organizations are based in the city. In Kenya, the Banking sector is composed of the Central Bank of Kenya, as the regulatory authority and the regulated, Commercial Banks, Non-Bank Financial Institutions and Forex Bureaus. As at 31st Dec 2011 the banking sector comprised 45 institutions, 43 of which were commercial banks and mortgage finance companies. Commercial banks and mortgage finance companies are licensed and regulated under the banking Act 488 and Prudential Regulations and regulated under the Central Bank of Kenya (CBK) Act Cap 491. Out of the 45 commercial bank institutions, 33 were locally owned and 12 were foreign owned. The locally owned financial institutions comprised 3 banks with significant government shareholding, 28 privately owned commercial banks and 2 mortgage finance companies (NIFC's). Of the 44 private banking institutions in the sector, 71% were locally owned and the remaining 29% were foreign owned. According to the Central Bank of Kenya website by January, 2017 there are 44 commercial banks, 1 mortgage finance company (HFC), and 7 authorized holding companies in Kenya. Out of the 44 commercial bank institutions, 30 are locally owned and 12 are foreign owned.

Statement of the problem

The banking sector in Kenya has over the years faced a number of challenges including increasing competition, increased regulation by the government and high rate of technological growth especially the mobile phones that now offer banking services. The shift by commercial banks in Kenya to strategic management has created a lot of interest on the effect of compensation practices on employee performance. Commercial banks in Kenya are faced with issues of productivity, competition for customers, efficiency in operation, trade unions and high staff turnover. Such issues must be dealt with (Robbins, 2001). Achieving success in core business is the concern of every organization. This requires considerable skill, expertise, experience and judgment on the part of its staff. Commercial banks must implement motivational structures that will attract, retain and motivate employees to major objectives of the organizational pay system which include efficiency, equity and compliance with laws and regulations (Gomez and Balkin, 2014).

Employee performance among commercial banks has been a challenge due to high competition from other sectors on rewards and compensation, volatile financial sector environment, unfavorable government policy and above all dynamism in the labour market. Most of the staff are not motivated due to non-consumerate compensation and overwork among the banking institutions (Okioga, 2015)).Previous studies show that good compensation for employees will be able to stimulate the emergence of fresh ideas and employees' innovation.

Commercial banks in Kenya are faced with issues of productivity, competition for customers, efficiency in operation, trade unions and high staff turnover. To compete effectively, organizations must continually improve their performance by reducing costs, innovating products, improving quality, increasing productivity of staff and efficiency in operation. Past research has predominantly focused on the performance- pay strategies among CEO and top management. For instance Steven et.al.,(2011) investigated the relationship between firm strategy and the use of performance measures in executive compensation and found that there was an increased emphasis on sales in the determination of executive compensation for firms pursuing a cost leadership strategy in order to attain competitive advantage through low price and high volume. Studies that have been done on employee performance based pay include Kiarie (2015), a survey of performance based compensation schemes in companies listed at the NSE and Ooko (2013), employee perception of the link between performance and incentive pay.

Available literature highlights that most of the studies examining the relationship between HRM and employees' performance have been conducted in the manufacturing sector mostly in the United States (Huselid, 2011; Guest, Michie, Conway, & Sheehan, 2013). Very few studies have been done in Kenya particularly in the banking sector. This study therefore sought to establish the influence of compensation schemes on the employee performance among commercial banks in Nairobi City County, Kenya.

General Objective

The general objective of this study was to establish the relationship between Compensation schemes and employee performance among commercial banks in Nairobi City County, Kenya.

Specific Objectives

The study was guided by the following specific objectives;

i. To establish the relationship between commissions and employee performance among commercial banks in Nairobi City County, Kenya.
ii. To determine how bonus schemes influence employee performance among commercial banks in Nairobi City County, Kenya.

Research Questions

i. What is the influence of commissions on employee performance among commercial banks in Nairobi City County, Kenya?
ii. What is the influence of bonus schemes on employee performance among commercial banks in Nairobi City County, Kenya?

Scope and limitations of the study

The study sought to establish the influence of compensation schemes on employee performance among commercial banks in Nairobi City County, Kenya. The compensation schemes considered include incentives, piece rate systems, commissions and bonus schemes. The study focused on the 44 commercial banks in Kenya which have been licensed and regulated by the Central Bank of Kenya as per the attached list in appendices and have operations in Nairobi County. The study was confined to banks in Nairobi City County since it is the main hub and headquarters for all the banks in Kenya According to Central Bank of Kenya website there were forty two licensed commercial banks and one mortgage finance company as at January, 2017.

Theoretical Underpinnings

Herzberg's Two-Factor Theory divides motivation and job satisfaction into two groups of factors known as the motivation factors and hygiene factors. According to Frederick Herzberg, "the motivating factors are the six 'job content' factors that include achievement, recognition, work itself, responsibility, advancement, and possibility of growth. Hygiene factors are the 'job context' factors, which include company policy, supervision, relationship with supervision, work conditions, relationship with peers, salary, personal life, relationship with subordinates, status, and job security" (Ruthankoon, 2013). Basically Herzberg theory differentiates the factors between intrinsic motivators and extrinsic motivators. The intrinsic motivators, known as the job content factors, define things that the people actually do in their work; their responsibility and achievements. These factors are the ones that can contribute a great deal to the level of job satisfaction an employee feels at work. The job context factors, on the other hand, are the extrinsic factors that someone as an employee does not have much control over; they relate more to the environment in which people work than to the nature of the work itself (Schermerhorn, 2013). The theory supports the study on the motivation and hygiene factors. Reward and competition are some of the key motivators of employees in an organization. Managers and owners of firms should appreciate the efforts of their work force by remunerating, recognizing and rewarding them accordingly. This will assist in reducing employee turnover among firms especially commercial banks.

Expectancy Theory

This theory was proposed by Victor Vroom (1932) of the Yale School of Management. Expectancy theory (or expectancy theory of motivation) proposes an individual will behave or act in a certain way because they are motivated to select a specific behaviour over other behaviours due to what they expect the result of that selected behaviour will be. In essence, the motivation of the behaviour selection is determined by the desirability of the outcome. However, at the core of the theory is the cognitive process of how an individual processes the different motivational elements. This is done before making the ultimate choice. The outcome is not the sole determining factor in making the decision of how to behave. The theory supports the study that favourable human resource management practices are meant to motivate employees which will boost their expectancy and hence their retention in the organization. Compensation schemes are some of the significant human resource management practices that foster employee productivity in a firm.

Literature Review

Literature on the dependent variable and the two independent variables on commissions and bonus were reviewed

to identify the gaps in research.

Commissions and Employee Performance

Appelbaum (2016) on an analysis of the effect of sales commissions on firm performance indicated that the commission schemes improve rate of sales but interest of the organization or the customer may not predominate. This can be reduced by paying only for outcomes which are acceptable to the organization or by paying true salary, which is related to wider issues than financial performance (Appelbaum, 2016).

Mach (2013) on exploratory study on the influence of commission schemes on sales, indicated that commission schemes typically treat the salesperson as a self-standing profit unit. The commission plan is structured to share the gross margin of sales between the organization and the salesperson. If the organization provides selling tools such as a car, mobile phone or portable computer, these costs may be explicitly taken into account. He further indicated that the main risk inherent in commission schemes is that the sales person will be motivated only by personal gain.

Taylor (2014) on his analysis on the other hand, on the relationship between commission based remuneration and career progression among the sales staff in South Africa indicated that commission pay scheme might not give any recognition to levels of competence or performance except through the level of earnings. In these circumstances salespeople often ask for a career structure. This can be provided by defining the number of levels of sales role. Progression through these is governed by a set of criteria which could include performance levels and competence standard. Commission is a variable component of compensation package. It is given on the basis of business generated by the employee. Commission is a pre fixed component say 5% of the total sales done by the employee. It is practiced in the retail and other sectors in the marketing and sales segment.

According to McConnell et al (2014) on the effect of commissions on sales for FMCG companies in the UK, payments often are calculated on the basis of a percentage of the goods sold, a way for firms to solve the principal–agent problem by attempting to realign employees' interests with those of the firm. Sales personnel are thus paid, in part of entirely, on the basis of products or services successfully sold rather than being paid by the hour, by attempted sales, or by any other measure. A common form of commission sales is real estate; in the United States, a real estate agent who successfully sells property will collect a commission of 6% of the sale price but a realtor who makes no sales will collect no salary or compensation whatsoever.

Madhani (2017) did a study on how commissions improve employee performance commissions are intended to create a strong incentive for employees to invest maximum effort into their work. One of the most common means of attempting to align principal and agent interests is to design a contract with incentives that track agent performance. The principal–agent theory provides an explanation for the dissimilarities across the marketing firms in the types of compensation plans used by them, such as fixed salary, straight commission or a combination of both fixed salary and straight commissions. Often, a firm embracing a commission structure may not involve employees, but may solely establish themselves using independent contractors. Reward in the form of commission alone with no pay or salary is known as straight commission. Reward may also take the form of commission plus a fixed salary. Industries where commission is commonly paid include car sales, property sales, insurance broking, and many other sales jobs.

Bonus Schemes and Employee Performance

A company that gives its employees bonuses is bound to motivate them to perform highly (Dohmen and Falk, 2017). Furthermore, Mwita (2012) concludes by stating that, the performance incentive bonus scheme is the logical process by which an organization includes its employees as individuals and team members, in refining organizational effectiveness in the achievement of organizational goals and mission. This information is further backed up by Kanji (2015) who stated that performance Incentive Bonus Scheme is a pillar of any individual life and organization, once employees appreciate what needs to be done and when and why/what is to be done, then the organization will achieve its goals and employees will feel empowered.

Methodology

A descriptive research design was adopted for the study. According to Mugenda and Mugenda (2013) the purpose of descriptive research is to determine and report the way things are and it helps in establishing the current status of the population under study and is useful for describing, explaining or exploring the existing status of two or more variables.The target population comprised of all the 44 commercial banks licensed and regulated by the Central Bank of Kenya with head offices in Nairobi City County. The target population consisted of staff members working in the human resources department who include 44 top level managers one from each bank, 84 middle level managers two from each bank and 210 low level managers who will be 5 from each of the 44 commercial banks registered and regulated by the Central Bank of Kenya with operations in Nairobi City County, who made a total of 336 .

Table.1: Sample Size

Category	Population	Sample Ration	Sample Size
Top level managers	44	0.3	12
Middle level managers	84	0.3	25
Low level managers	210	0.3	63
Total	**336**	**0.3**	**101**

Source: Researcher (2018)

The study covered all commercial banks but sampled the respondents from each of the 44 banks using the stratified random sampling technique. Kothari (2014) argues that when all items are covered, no element of chance is left and highest accuracy is obtained. Kothari (2015) argues that if well-chosen a sample of 30% of a population can often give good reliability findings. Mugenda and Mugenda (2013) stated that in stratified random sampling where population within each stratum is known, a sample of 30% is adequate representation for data collection. Therefore 30% of each stratum formed the sample for the study as shown in Table 1.

Data was collected using a semi-structured questionnaire. The study sought to establish the validity of the questionnaire through the opinion of the research project supervisor and a field test to measure the face and content validity. A pilot study or pre-test was done in I&M bank and respondents who took part

were not included in the main study. The pre-test enabled update the research questionnaire hence enhancing content validity. Reliability was tested using Cronbach's coefficient alpha (Cronbach 1951).

a Cronbach's coefficient above 0.70 is acceptable as an internally consistent scale so that further analysis can be possible.Before processing the responses, the completed questionnaires were edited for completeness and consistency. Descriptive analysis was used; this includes the use of weighted means, standard deviation, relative frequencies and percentages. The study was guided by the following regression model to establish the relationship between the study variables:

$$\mathbf{Y= \alpha + \beta_1 X_1 + \beta_2 X_2 + \varepsilon}$$

Y = Employee performance

α = Constant

β = Coefficients

X_1= Commissions

X_2= Bonus schemes

ε = Error Term

Data Analysis and Findings

A total number of 101 questionnaires were issued out to respondents of the study by the researcher. From these questionnaires, 79 of them were completely filed and returned to the researcher. This was equivalent to a response rate of 78.2%.

Descriptive Analysis

Descriptive statistics were used to describe how compensation schemes affected employee performance of commercial banks in Nairobi city county, Kenya. In particular, means and standard deviation were employed. This section presents the findings of the analysis using these descriptive statistics.

Commissions and Employee Performance

The findings on commissions and how they influenced employee performance are shown in Table 2

Table 2 **Commissions and Employee Performance**

	Mean	Std. Dev
The bank has a commission based payment system for sales staff	4.13	0.872
The bank gives employees a retainer then commission based on volume of sales	4.14	0.617
The bank only pays sales staff commissions without any salary	3.53	1.065
The bank has a graduated commission system	3.73	0.783
Employees are consulted in designing the commission criteria	3.49	0.529
Management only decided on the commission to be earned	3.78	0.893
Commissions given are not competitive	3.44	0.875
The commissions paid to employees are not motivating	3.47	0.898
Average Score	**3.71**	**0.816**

The findings in Table 2 indicate that the bank gave employees a retainer then commission based on volume of sales with a mean of 4.14 and standard deviation of 0.617. The study revealed that the bank had a commission based payment system for sales staff with a mean of 0.872 and standard deviation of 0.872. The findings of the study further indicated that the management only decided on the commission to be earned with a mean of 3.78 and standard deviation of 0.893. The study revealed that the bank had a graduated commission system with a mean of 3.73 and standard deviation of 0.783. A small portion of respondents however agreed that their bank only paid sales staff commissions without any salary with a mean of 3.53 and standard deviation of 1.065. Respondents however were not sure whether employees were consulted in designing the commission criteria with a mean of 3.49 and standard deviation of 0.529, the commissions paid to employees were not motivating with a mean of 3.47 and standard deviation of 0.898 or the commissions given were not competitive with a mean of 3.44 and standard deviation of 0.875.

On average, respondents agreed with a mean of 3.71 that commission affected employee performance. Taylor (2014) on his analysis on the other hand, on the relationship between commission based remuneration and career progression among the sales staff in South Africa indicated that commission pay scheme might not give any recognition to levels of competence or performance except through the level of earnings.

Bonus Payments and Employee Performance

Table 3 reports the findings on bonus payments and how they influenced employee performance.

Table 3: Bonus Payments and Employee Performance

	Mean	Std. Dev
The firm has a bonus payment system for staff	3.98	0.789
Bonus payments are done at the end of each financial year	3.96	0.881
Bonus payments are based on employee targets	3.69	0.982
Bonus payments are based on organizational targets	3.89	0.874
Organizational mission determines bonus payments	3.59	0.890
Bonus payment system is not standardized	3.40	0.887
Average Mean	**3.75**	**0.883**

As shown in Table 3 the study revealed that the firm had a bonus payment system for staff with a mean of 3.98 and standard deviation of 0.789. The study established that bonus payments were done at the end of each financial year with a mean of 3.96 and standard deviation of 0.881. The study revealed that bonus payments were based on organizational targets with a mean of 3.89 and standard deviation of 0.874. The study established that bonus payments were based on employee targets as shown by a mean of 3.69 and standard deviation of 0.982. Some respondents slightly agreed that their bank mission determined bonus payments with a mean of 3.59 and standard deviation of 0.890. Respondents however were not sure whether bonus payment system was not standardized with a mean of 3.40 and standard deviation of 0.887.

The average mean was 3.75, which shows that respondents generally agreed on the statements under bonus payment. Kanji (2015) stated that performance Incentive Bonus Scheme is a pillar of any individual life and organization.

Employee Performance

Employee performance was the dependent variable of the study. The findings are shown in Table 4.

Table 4: Employee Performance

	Mean	Std. Dev
The output per employee has significantly improved with the reward system	3.88	0.673
The level of job satisfaction among staff has improved	3.63	0.997
Customer service has increased with performance based rewards on staff	3.89	0.876
Employee efficiency has improved with performance based rewards	3.76	0.888
The compensation schemes system in the bank has improved employee effectiveness	3.77	1.064
The bank staff are motivated and feel proud working for the bank	3.68	0.873
Customer loyalty has improved	3.65	0.872
Average Mean	**3.75**	**0.891**

The study established that customer service had increased with performance based rewards on staff with a mean of 3.89 and standard deviation of 0.876. The findings on employee performance from Table indicate that the output per employee had significantly improved with the reward system with a mean of 3.88 and standard deviation of 0.673. The study established that compensation schemes system in the bank had improved employee effectiveness with a mean of 3.77 and standard deviation of 1.064. Employee efficiency had improved with performance based rewards as shown by a mean of 3.68 and standard deviation of 0.876. The study established that the bank staff were motivated and felt proud working for the bank as shown by a mean of 3.68 and standard deviation of 0.873. Respondents agreed that customer loyalty had improved as shown by a mean of 3.65 and standard deviation of 0.872. The level of job satisfaction among staff had improved with a mean of 3.63 and standard deviation of 0.997.

Regression Results

Regression analysis was employed to determine how compensations schemes influenced employee performance. The findings are reported in sections that follow. Table 5 is the Model Summary that indicates the value of the coefficient of determination R squared.

Table 5: Model Summary

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	.858[a]	.737	.703	1.92029

From the findings in Table 5, the coefficient of determination R square is 0.737. This shows that 73.7% change in employee performance is explained by compensation schemes in place. The findings of the Analysis of Variance (ANOVA) are shown in Table 6.

Table 6. Analysis of Variance

	Sum of Squares	df	Mean Square	F	Sig.
Regression	317.067	2	79.267	51.842	.000[b]
Residual	113.146	74	1.529		
Total	**430.213**	**76**			

As shown in Table 6, the value of F calculated is 51.842 while F critical (from the F-tables) is 2.495. Since the value of F calculated is greater than F critical, this indicates that overall regression model was fit. The findings on the p values and beta coefficients of each of the study variables are reported in Table 5

Table 7: Coefficient Results

	Unstandardized Coefficients		Standardized Coefficients		
	B	Std. Error	Beta	t	Sig.
(Constant)	3.207	1.474		2.175	.043
Commissions	.179	.081	.215	2.201	.030
Bonus schemes	.171	.069	.229	2.475	.015

From Table 7, the following regression equation is formulated;

$$\mathbf{Y=3.207+0.179X_3+\ 0.171X_4\ +e}$$

Y = Employee performance; X_1= Incentives; X_2= Piece rate systems; X_3= Commissions and X_4= Bonus schemes.

Thus, the possible level of employee performance when all the factors were held constant would be 34.207.

At 5% level of significance, Commission (β=0.179, p=0.030<0.05) had a positive and significant effect on employee performance. The findings of the current study agrees with Appelbaum (2016) on the analysis of the effect of sales commissions on firm performance indicated that the commission schemes improve rate of sales but interest of the organization or the customer may not predominate.

Bonus schemes (β=0.171, p=0.015<0.05) had a positive and significant effect on employee performance. This study concurs with Kanji (2015) who stated that Bonus Scheme is a pillar of any individual life and organizational Performance.The study established that commissions had a positive and significant effect on employee performance. The bank gave employees a retainer then commission based on volume of sales. The study revealed that the bank had a commission based payment system for sales staff. The findings of the study further indicated that the management only decided on the commission to be earned. The study revealed that the bank had a graduated

commission system.

The study established that bonus payment had a positive and significant effect on employee performance. The study revealed that the firm had a bonus payment system for staff. The study established that bonus payments were done at the end of each financial year. The study revealed that bonus payments were based on organizational targets. The study established that bonus payments were based on employee targets.

Conclusions

The study concludes that commissions have a positive and significant effect on employee performance. The bank gave employees a retainer then commission based on volume of sales. The bank had a commission based payment system for sales staff. The management only decided on the commission to be earned. The bank had a graduated commission system. The study further concludes that bonus payment has a positive and significant effect on employee performance. The firm had a bonus payment system for staff. The bonus payments were done at the end of each financial year. The bonus payments were based on organizational targets.

Suggestions for Further Studies

The focus of the current study was on remuneration schemes and how they influenced employee performance. From regression analysis, the value of R square was 73.7% showing that there exist other factors apart from remuneration schemes that have an influence on employee performance. Thus, future studies should focus on these other factors with significant influence on employee performance.

The focus of the current study was on commercial banks operating in Kenya that belong in the larger financial industry. Thus, future studies should focus on other firms within the financial sector including Micro-finance institutions and SACCOs. This would facilitate generalization of the finding to the entire finance sector.

MARKETING STRATEGIES AND PURCHASE DECISION AMONG CONSUMERS OF SMARTPHONES IN NAIROBI CITY COUNTY, KENYA

Irene WairimuMwaniki[1], Dr. Jane Wanjira[2]& Dr. Samuel Maina[3]

[1]Msc (Marketing) student, Kenyatta University, School of business

[2] Lecturer, department of Business Administration, School of Business, Kenyatta University

[3]Lecturer, department of Business Administration, School of Business, Kenyatta University

Abstract*: The study sought to establish the effect of marketing strategies among consumers of smartphones in Nairobi City County. The study was guided by the Stimulus Response Model, Howard & Sheth model and Jerome McCarthy' 4Ps, it applied descriptive and explanatory research design. Residents of Nairobi between the ages 18 and 35 years formed the target population, they were approximated to be 1,694,127 and a sample size of 278 drawn from this population. The research adopted area sampling method which is a form of cluster sampling and data was collected using self-administered questionnaires based on a 1-5 Likert Scale. Descriptive and inferential data was analyzed using stepwise multiple regression and data was tested using SPSS (22.0). Findings reveal that product strategies significantly influenced purchased decision with brand name and camera resolution being the leading drivers. Pricing strategies also had a significant influence on purchase decision with everyday low pricing, free data bundles and high price for high specifications as the most significant strategies. Place strategies significantly influenced purchase decision with indicators like shops stocking a wide variety of phones, online presence and availability of warranty centers being the most significant. Social media reviews, family and friends, TV advertisements were the most effective of all promotion strategies items. Customer characteristics (age, education and income) had a significant moderating effect on the relationship between marketing strategies and purchase decision. Based on these findings the study concluded that marketing strategies do have a significant effect on purchase decision.*

Keywords: ***Marketing strategies, purchase decision, differentiation, branding***

Introduction

The purchase decision is one of the important stages in the consumer buying process. It is at this point that the consumer actualizes the process that involved need recognition, information search and evaluation of alternatives by acquiring the product (Kotler & Keller, 2012). Today's consumer is more informed and knowledgeable about the products they want, this has created a shift in how manufacturers design, communicate and price their products, with more focus on the consumer needs and wants (Blackwell, Miniard, & Engel, 2006).Organizations today have adopted the marketing concept whereby an organization focuses all its efforts at satisfying the customer and understanding what it takes to satisfy him/her as they consider the consumer to be the path to profits (Perreault & McCarthy, 2005). Factors such as product features, price and social influence significantly determine demand for smartphones (Suki, 2013). Product strategies like differentiation, product life cycles, branding, pricing strategies like cost, breakeven , marginal analysis, promotion strategies through the various channel have a huge effect on the choices that consumers make as portrayed by Saif and Aimin(2015) in their research on analysis of Huawei's smartphone strategies in the Arab world.The regional Smartphone market has seen tremendous growth in the demand putting Africa at the third position globally in high volume shipments of handsets (IDC, 2017).

The Kenyan market has several operators or service providers like Safaricom, Airtel, Finserve, Telkom Kenya and Sema Mobile services, of these operators Safaricom has the largest share of subscriptions with 71.2%, followed by Airtel at 17.6%, Telkom Kenya at 7.4%, Finserve at 3.8% and the rest goes to Sema Mobile services (CA, 2016). These players have facilitated the increased demand for smart phones in the market.The key brands of smartphones in Kenya include Samsung, Apple, Huawei, Oppo, Infinix, Sony, Tecno, and HTC among others. Samsung smartphone sales in Kenya were considered to be the highest in year 2016 at 24.37%, followed by Huawei at 6.68%, Nokia5.50%, LG 1.77%, Alcatel at 1.16 and the other vendors like Oppo, Tecno, IPhone among others sharing 59.36% in the third quarter of 2016 (Evolita, 2016).

In Kenya there are few notable studies on Smartphones and consumer choice like the growth of the smartphone market in Kenya (Zab, 2015), mobile phone usage among university students in Kenya, a case of Nairobi university student (Octutu, Martita, Nyakerario, Wanekeya, &Akoth, 2014), Factors Influencing Young Kenyan Consumers' Use Of Smartphones (Odipo, 2016), though the studies touch on smartphone usage they hardly focus on the

consumer purchase decision. Researches and reports that have been conducted by private and government firms in Kenya fail to connect the marketing aspect with the consumer purchase decision. Smartphone industry reports on volume of handset sold globally by research firms like CCS Insight and International Data Corporation (IDC). The local research on mobile subscriptions by Communications Authority of Kenya (CAK) only focuses on statistics of smartphone brands in volumes. They do not narrow down on the specifics of the consumer's purchase decision in regards to how they arrived at their decision. Hence the need to conducta research whichto provided empirical data on factors behind the consumer choice of smartphones in Nairobi City County.

Marketing Strategies

Strategy is the long-term course of action taken up by an organization and is created to deliver a unique customer experience while achieving its goals (Kerin, Hartley, & Rudelius, 2009). A marketing strategy is the big picture a firm has for a market, two intertwined parts are needed to achieve this and that is the target market and the marketing strategies (Perreault & McCarthy, 2005)., it is also an organizations path to creating value for consumers and defining the boundaries from which to operate from (Paswan, Charles, & Guzman, 2011).Theories relating to marketing strategies for instance example Stimulus response Model (Kotler 1997), Howard and Sheth (1969) and Jerome McCarthy (1960) 4Ps of marketing among others focus on how to meet and satisfy customer needs better than the competition. The 4ps of marketing namely price, product, place and promotion was introduced by Jerome McCarthy back in 1960 as a framework that identifies the prime choices made by managers in firms in designing their offerings to match the needs and wants of the consumer (Goi, 2009).

As the discipline of marketing has continued to expand and grow the theory is taking on new forms with additional Ps like people, process and physical evidence (Bitner, Booms, & Tetreault, 1990)for services marketing, Partner, Presentation and passion (Londre, 2016).McGrath(1994) also suggested three additional Ps namely personnel, physical facilities and process management, for the purpose of this study we will focus on the tradition 4Ps by Jerome McCarthy(1964) which focuses on price, product, promotion and place. Even in changing marketing landscapes, the 4Ps are still relevant and the model combines the four elements namely price, product, place and promotion into a most favorable blend that seeks to satisfy the consumers' needs and wants, it is also dynamic and can adapt to changing needs and wants of consumers (Dimitrova, 2011).

Literature Review

The research relied on 3 major theoretical models namely the stimulus response model, Howard and Sheth and the 4Ps model. The stimulus response model is based on the marketing environmental and a set of psychological processes that combine with certain consumer characteristics that help in a series of steps in making decisions and ultimately the purchase decision(Kotler & Keller, 2012). The Howard and Sheth model sought to show the relationship between the stimulus responses in order to explain the consumer's purchase decision behaviour over a period of time(Jisana, 2014).Finally the 4Ps model focuses on 4 aspects namely price, product, promotion and place. It asserts that the customer is not part of the marketing strategy but the target of the marketing efforts (Perreault & McCarthy, 2000). This model also guides the current study as it supports the independent variables giving deep insights into how they operate and how they designed to ensure the client needs and wants are met.

Research on product strategies and consumer purchase decision indicate that the products innovative features, quality brand image, family and friend influence were among the leading motivating factors behind the purchase of a mobile phone (Khan &Rohi, 2013). Features that consumers would want to identify with in an innovative product like a smartphone include the relative advantage, compatibility, trialability, observability and complexity (Clarke, 1999). An almost similar criteria that consumers used to select a product as noted by Belbag, Gungordu, Yumusak and Yilmaz(2016) in their study is its user friendliness, durability, design and resolution.

Price strategies in the smartphone market like low cost are among drivers of purchase (Zab, 2015). Similarly Samsung mobile used a high quality-low price strategy to penetrate the Indian market (Singh, 2012). Pricing should be done in such a way that it upholds the image of the brand and that its quality has not been compromised or a dilution of brand equity as found out in a research conducted by Erdem, Keane &Sun (2008). Rao (2009) noted that end users are sensitive to price change and differences among brands and use these price differences to switch brand. Promotion Strategies focused on promotional activities related to offering information to the consumer either by advertising in the media, through suppliers or through social media also play a part in consumer purchase decision. Studies by Alshurideh, et al.,(2015) found there was a statistically significant effect of informational reinforcement

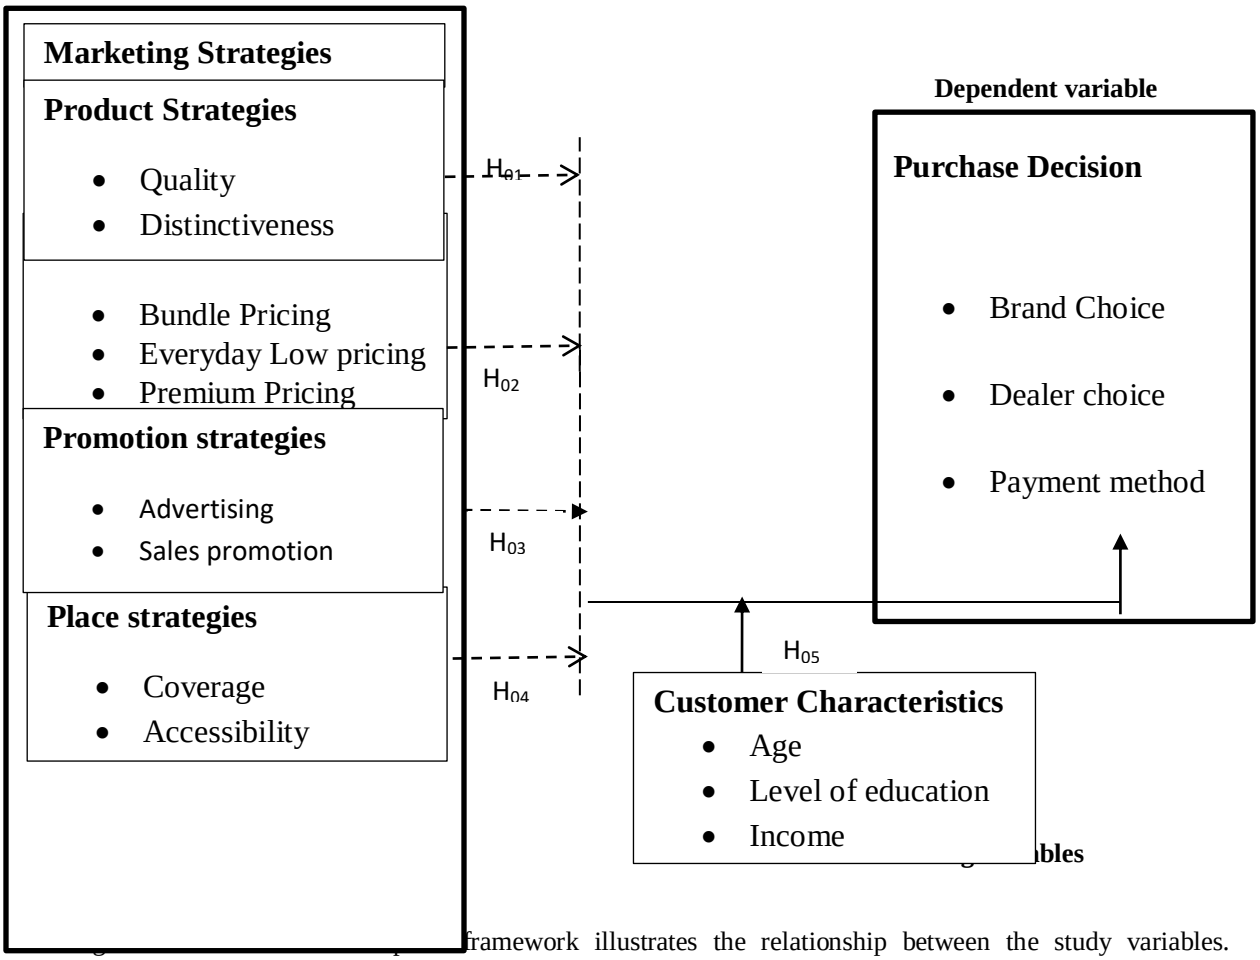
on mobile brand choice and that the various sources of information available to the consumer drove his or her choice for the mobile phone. Findings by Odoom (2016) indicate that one of the advertising options like celebrity endorsement were 1.583 times more likely to influence choice and loyalty. Finding in a research by Woo& and Koo(2015) indicate that consumers made a decision to purchase goods like mobile phone via sources of information (in order of highest preference) like word of mouth, TV broadcast, internet search, subscription TV, magazines, radio and finally newspapers.

Place strategies involve the distribution channels, availability of the product to the consumer in terms of how many outlets stock the desired product is crucial when it comes to brand choice, manufacturers that have an intensive distribution design with marketing support programs end up having more retailers stocking their products and hence increasing presence and availability as researched by Frazier &Lassar (1996). Findings in a study by Alshurideh, Bataineh, Alkurdi and Alasmr (2015) argued that the services offered by the vendor like warranty and after sales services were found to be critical in the purchase of a mobile phone

Conceptual Framework

Figure 1: Conceptual framework guiding the study

Independent variables



framework illustrates the relationship between the study variables. The independent variables for the study were price, product, place and promotion, the dependent variable was purchase decision. The moderating variables included age, income and level of education.

Research Methodology

The study was guided by positivism philosophybecause of its ability to allow for data to be strategically analyzed, and for hypotheses to be developed and proven empirically (Schiffman & Kanuk, 1997). Descriptive research design which was cross sectional in nature was used to establish knowledge that describes the characteristics of problem

(Foya, 2015). It was considered appropriate as it embraced probability sampling and allowed for structured instruments of data collection hence setting the nature and standard of the research (Kothari, 2004). The cross sectional nature ensured that the observations were done and data was collected at one single point in time(Tashakori & Tedllie, 2003).

Target population included consumers of ages between 18-35 years; who were mostly employees, businessmen and women, students in the city. The study used multistage sampling design which originates from cluster sampling design; the design is used for large geographical areas. Multistage sampling design divided the large geographical areas into a number of smaller units that do not overlap and were randomly selected to be included in the overall sample (Kothari, 2004). Determination of sample size was by the use of the formula by Yamane (1967) which yielded 278 respondents. The research used structured questionnaires as the tool for data collection. They were considered to be the most convenient forms of data collection as they could be standardized and covered all aspects of the topic(Kothari, 2004).

Pretesting of the questionnaire was done among 10university students and redesign and calibration was done immediately after the feedback and then questionnaires were issued to the intended respondents. This ensured that content, criterion and construct validity was achieved. Test for reliability gave a Cronbach Alphawas utilized. The outcome of the test gave an alpha value of 0.749. This indicates that the instrument reliable as guided byNunnally (1978) who states that a value of 0.7 and above shows that the research tool is reliable.

The study was guided by five (5)research hypotheses listed H_{01}- H_{05}

H_{01} Product strategies have no significant effect on purchase decision among consumers of smartphones in Nairobi City County Kenya

H_{02} Pricing strategies have no significant effect on purchase decision among consumers of smartphones in Nairobi City County Kenya

H_{03} Promotion strategies have no significant effect on purchase decision among consumers of smartphones in Nairobi City County Kenya

H_{04} Place strategies have no significant effect on purchase decision among consumers of smartphones in Nairobi City County Kenya

H_{05} Customer characteristics have no significant moderating effect on the relationship between marketing strategies and purchase decision among consumers of smartphones in Nairobi City County Kenya

The general multiple regression model to test the effect of the independent variable on the dependent variable took the form shown in model (i). The model was further computed to establish the effect of each individual independent variable on the independent variable

$$\mathbf{Y=\beta_0+\beta_1X_1+\beta_2X_2+\beta_3X_3+\beta_4X_4+\varepsilon}\ldots\ldots\ldots\ldots\ldots\ldots\ldots\ldots\text{Model (i)}$$

Where:
Y=Consumer purchase decision β_0=Constant term ε =Error term

β_1-β_4=Beta Coefficient of Marketing strategies

X_1=Product strategies, X_2= Price strategies, X_3= Promotion strategies, X_4= Place strategies

In order to establish the moderating effect of the moderating Variable – customer characteristics

on the relationship between the independent variables and the dependent variable model (ii) was used as illustrated.

$$\mathbf{Y=\beta_0+\beta_5MSx+\beta_7MS*CC+\varepsilon}\ldots\ldots\ldots\ldots\ldots\ldots\text{Model (ii)}$$

Where:

Y= Purchase decision
β_0= Constant
MSx=Composite index for Marketing Strategies-Product, price, promotion, place
CC= Customer Characteristics
B_7= Beta coefficient of the interaction between marketing strategies and customer characteristics
Customer characteristics items included the age, gender and education level of the respondents, therefore the fifth hypothesis was tested for moderation by using three sub-hypotheses with indicators of the customer characteristics using multiple regression.The study adopted a three step approach whereby the first step was to get the composite index of marketing strategies which is the independent variable regressed against the dependent variable purchase decision.

Research Findings and Discussion

The research targeted a sample of 278 respondents. Questionnaires were distributed to the 278out of whome171 responded giving a response rate of 61.5% . The rate was considered adequate for analysis as recommended by Babbie (2002) who considered 50% response rate as adequate.

Table 1: Demographic information of the respondents

Demographic information	Frequency (n = 171)	Percent%
Gender		
Male	117	68.4
Female	54	31.6
Age (years)		
18 – 23	10	5.8
24 – 29	40	23.4
30 – 35	70	40.9
36 and above	51	29.8
Highest Level of Education		
Primary	1	0.6
Secondary	13	7.6
Diploma/Certificate	54	31.6
Degree and above	103	60.2
Nature of occupation		
Self employed	54	31.6
Full time employment	90	52.6
Part time	7	4.1
Not employed	20	11.7

Source: Survey Data (2018)

The findings presented in Table 1 indicates that majority of the respondents were male at 68.4%and female at 31.6%.The respondents ages were divided into four categories namely 18-23 years, 24-29 years, 30-35 years and 36-years and above. Most of the respondents were between the ages of 18-35 which cumulatively accounted for 70.1% of the respondents.Education was classified under four categories namely primary, secondary, diploma/certificate and degree and above. 60.2% of the sampled respondents had a degree and above and 31.6% had Diploma/Certificate level of education.

Descriptive analysis

Marketing Strategies

The results of the four independent variables of the marketing strategies which were product, price, promotion and place strategies are presented in Table 2

Table 2: Summary of marketing strategies

Item	Description	Aggregate mean Scores
1	Product Strategies	3.71
2	Pricing Strategies	2.68

3	Promotion Strategies	2.93
4	Place Strategies	3.29
	Aggregate Mean score	**3.44**

Source: Survey Data (2018)

As presented in Table 2, product strategies had the highest mean score of 3.71 followed by place strategies at 3.29, promotion strategies at 2.93 and price strategies at 2.68.With an aggregate mean score of 3.44, marketing strategies influenced purchase decision to a moderate extent. The results were based on questionnaires that used a likert scale of 1-5 with 1=Not at all, 2=little extent,3=moderate extent, 4=large extent, 5=Very large extent.
Product strategies used on purchase decision among consumers of smartphones was established based on seven test items; brand name, processing speed, battery life, size of the handset, durability, Camera resolution and color of the phone. Responses received indicated that the respondents considered the battery life to a large extent followed by processing speed and durability which had mean scores of 4.20, 4.12 and 4.09 respectively. Similarly studies by Khan and Rohi (2013), Suki (2013), Alshurideh, Bataineh, Alkurdi&Alasmr (2015) also found processing speed as a big decision influencer when purchasing a smartphone. Also worthy to note is that battery life ranked 9 out of 14 items which implies that consumers considered the battery life when looking to buy a smartphone (Saif & Aimin, 2015). The aggregate mean score of product strategies was 3.71 with a standard deviation of 1.25, an indicator that consumers highly valued the product features to an almost large extent.

The effect of pricing strategies was similarly tested based on six items namely free data bundles, phone accessories, constant low price, everyday low prices, high price for highest specifications and discounts. Respondents greatly considered discounts in pricing at the time of purchase to a moderate extent with a mean score of 3.53. An aggregate mean score of 2.68 and standard deviation of 1.35 is a positive indicator that the pricing strategies play a role in influencing the purchase decision for smartphones among consumers to little extent.Discounts increased the chances of purchase by up to 76% (Fang, Luo, Andrews, & Phang, 2014). An indicator that manufacturers have to focus more on quality of the product so as to attract more customers (Alshurideh, Bataineh, Alkurdi, & Alasmr, 2015).

Promotion strategies on purchase decision among consumers of smartphones were established on six test items. These source of information included print media, Television advertisements, family and friends, social media reviews, mobile phone displays and loyalty programs. The respondents mainly considered family and friends and social media reviews as the most influential sources of information regarding a smartphone with mean scores of 3.33 and 3.23 respectively. These finding are consistent with Suki (2013) and Khan &Rohi (2013) that showed family and friends as key variables that influence a purchase decision. The aggregate mean score for promotion strategies was 2.93 and standard deviation of 1.35, this is an indicator that promotion strategies played a role in the purchase decision a nearly moderate extent.

Place strategies effects was analyzed based on six test items namely ease in accessibility, stock of wide variety, availability of warranty centers, online presence, offering of delivery services and manufacturer's presence at the shop.The average response indicates that the respondents considered availability of warranty centers in their decision making to an almost large extent with a mean score of 3.86. Similarly 80% of respondentsconsidered after sales services like warranty as a factor that would make them buy the same brand of smartphone again (Chen, Chen, & Lin, 2016). Zab (2015) also recommends that brands wishing to get ahead must create great attention in after sales services. The aggregate mean score for place strategies is 3.29 and a standard deviation of 1.38, this implies place strategies had a positive influence on purchase decision to a moderate extent

The effect of marketing strategies on purchase decision among consumers of smartphones was established based on six test items. This included loyalty, popularity of the brand, stocking at preferred shop, accessibility of the preferred shop, variety of payment options and credit facilities offered by the shop. A high number of respondents agreed that their preferred shop is easily accessible with a mean score of 3.41. This was followed by brand loyalty and access to a wide variety of payment options which had means scores of 3.25 and 3.14 respectively.

Availability of shops has often been cited as one of the important factors of ensuring a product reaches the consumer easily, Huawei strategy of having their markets divided into first tier and lower tier markets increased their penetration and ultimately the demand for their product in the Middle East (Saif & Aimin, 2015). The aggregate mean score of 2.95 and a standard deviation of 1.39 is a strong indicator that consumers have a positive view of their purchase decision and considered it to a moderate extent.

Inferential Statistics

Diagnostic Tests

Several diagnostic tests were conducted, a normality test using the Shapiro-Wilk test resulted in p-value of 0.340, 0.448, 0.451, 0.437 and 0.134 for product, price, place, promotion strategies and consumer purchase decision respectively. At the $p<0.05$ significance level the results were rejected concluding that data was normally distributed and satisfied the regression assumption of normality allowing further analysis of the variables. Linearity tests using deviation from linearity yieldedvalues of product, price promotion and place strategies at a p-values of 0.549,0.200, 0.275 and 0.310 respectively. At the significance level of $p<0.05$ the variables were above the significance level confirming that the relationship between the independent variables were linearly dependent (Field, 2009). Test for Multicollinearity using aggregate VIF indicator gave a value of 1.312 which showed that the data was suitable for hypothesis testing using regression since the VIF of the independent variables was less than 10 and greater than 1 (Field, 2009).

Test of Hypotheses and Discussion of results

The research was based on hypotheses that marketing strategies do not have any effect on purchase decision of smartphones among consumers in Nairobi County and that this relationship was moderated by the consumer characteristics. This section starts with presentation and interpretation of the results and followed by discussions of these results

Effect of marketing strategies (product, pricing, promotion and place) on purchasedecision

The actual effect of the marketing strategies on purchase decision was computed using a multiple regression model (i);

$Y = \beta_0 + \beta_1X_1 + \beta_2X_2 + \beta_3X_3 + \beta_4X_4 + \varepsilon$…….. (i)

Where Y = Purchase decision; β = Beta coefficient, β_0 = constant, X_1 = product strategy, X_2= pricing strategy, X_3 = promotion strategy, X_4 = place strategy, ε = error term

The results from this analysis are shown in Tables 3, 4 and 5. The results on goodness of fit were illustrated in Table 3.

Table 3:Model Summary for marketing strategies on purchase decision

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	.683	.466	.454	.71057

a. Predictors: (Constant), product, pricing, promotion and place strategy
b. Dependent variable , purchase decision

Source: Survey Data (2018)

As presented in Table 3, the regression result showed that R^2 value was 0.466 indicating that 46.6% variation in the purchase decision was as a result of the marketing strategies, this implies that the rest is explained by factors not included in the current study.

An Analysis of Variance (ANOVA) was computed to check the effect of marketing strategies on purchase decision and the results presented in Table 4.

Table 4: ANOVA for marketing strategies on purchase decision

Model	Sum of Squares	Degree of freedom	Mean Square	F	Significance Level

1	Regression	73.258	4	18.315	36.273	.000
	Residual	83.815	166	.505		
	Total	157.073	170			

a. Predictors: (Constant), marketing strategies(product, pricing, place promotion strategies)
b. b: Dependent variable , purchase decision

Source: Survey Data, (2018)

The results presented in Table 4 on analysis of variance shows an F statistic Value of 36.273, p-value of 0.000, at the significance level of $p<0.05$, marketing strategies had a significant effect on purchase decision.

Regression coefficients were analyzed for the individual independent variables and their effect on the dependent variable and findings presented in Table 5

Table 5 : Regression coefficients of marketing strategies on purchase decision

Model		Unstandardized Coefficients		Standardized Coefficients	t-Value	Significance Level
		B	Std. Error	Beta		
1	(Constant)	.328	.218		1.503	.135
	Product strategies	.263	.065	.292	4.021	.000
	pricing strategies	.135	.079	.130	1.714	.012
	promotion strategies	.261	.076	.260	3.435	.001
	place Strategies	.156	.068	.169	2.294	.023

Source: Survey Data (2018)

Findings presented in Table 5 indicate that the independent variables namely product, pricing, promotion and place strategies had *p*-values of 0.000, 0.012, 0.001 and 0.023 respectively, at the significance level of $p<0.05$, marketing strategies did have a significant influence on purchase decision among the consumers.

The standardized beta coefficients of product, pricing, promotion and place strategies were 0.292, 0.130, 0.260 and 0.169 respectively. The regression analysis thus, produced a model equation using standardized beta coefficient of;

$Y = 0.328 + 0.292X_1 + 0.130X_2 + 0.260X_3 + 0.169X_4$ where X_1 = Product strategy, X_2= pricing strategy, X_3 = promotion strategy, X_4 = place strategy.

Findings presented in Table 5 show that standardized beta coefficient of product strategies was 0.292, a t-statistic of 4.021 with a corresponding p-value of 0.000. With a t-statistic value of 0.292 it can be deduced that 29.2% of changes in purchase decision can be explained by marketing strategies, the rest was due to variables not captured in the study. At the significance level of $p<0.05$ product strategies had a significant effect on purchase decision. These findings are consistent with studies by Suki(2013), Mutinda (2016) and Mutuku (2011) where product strategies like brand name, processing speedand battery life were among the most influential among the respondents when making their purchase decision.

Pricing strategies had a standardized beta coefficient of 0.130, t-statistic value of 1.714 and a p-value of 0.012. These results imply that there was a positive relationship between pricing strategies and purchase decision. According to the t-statistic of 0.174, it can be concluded that a 0.174 change in purchase decision is a result of the pricing strategies, the rest is due to variables not captured in the study. At a significance level of $p<0.05$, the p-value of pricing strategies at 0.012 indicates that there was a significant effect of pricing strategies on purchase decision. In comparison to similar studies a low price for smartphones was found to have the highest number of respondents at a combined 45.8% (Khan &Rohi, 2013). Discounts for data traffic packages was also considered to be of importance (Saif&Aimin, 2015). Similarly discounts at the time of purchase was considered to be the most influential pricing strategy as illustrated in the current study. Consumer would be willing to pay a premium price for a smartphone brand of their choice (Muigai, 2017), price was found to have a significant effect on the buying behavior of smartphone consumers in all the highlighted researches.

Promotion strategies had a standardized beta coefficient of 0.260, t-statistic of 3.435 and p-value 0.001. These results indicate that the effect of promotion strategies on purchase decision was positive. The beta coefficient implied that only 26% of changes in purchase decision can be explain by the promotion strategies. Also at the significance level $p<0.05$, effect of promotion strategies on purchase decision was significant.These findings are in in line with studies where social media penetration in Kenya was found to be at 83% (Zab, 2015), in the current study social media was the second most preferred source of information on smartphones. Television advertising was found to be the highest source of information preferred by respondents for mobile phones (Woo, Ahn, Lee, & Koo, 2015), similarly promotion activities had significant influence among the youth consumers (Murigi, 2016). TV and social media advertisements highly influenced brand purchase decision and customers agreed that they would not buy a product if they didn't like the advertisement (Masimane, 2017).

Place strategies as presented in Table 5 show a standardized beta coefficient of 0.169, t-statistic 2.294 and a p-value of 0.023. This implies that the effect of place strategies on purchase decision was positive, also that a unit change in places strategies would create a proportionate increase in purchase decision. At the significance level of $p<0.05$, place strategies had a significant effect on purchase decision. In comparison to similar studies having an online presence was considered to be a critical element that influenced mobile brand choice (Alshurideh, Bataineh, Alkurdi, & Alasmr, 2015). Accessible dealer and operator shops greatly influenced purchase behavior (Mutuku, 2011), service quality after and during purchase of the product like warranty, had a significant effect on purchasing decision and brand loyalty on smartphone consumers (Chen, Chen, & Lin, 2016). This is similar to a response by majority of respondents in the current study who stated that availability of warranty centers influenced their purchase decision to a large extent.

Moderating effect of customer characteristics on the relationship between marketing strategies and purchase decision

Customer characteristics was assessed through its indicators income, age and level of education and results presented in Table 6.

Table 6: Summary of Coefficients for the moderating effect of age, education and income between the relationship of marketing strategies and purchase decision

Coefficients[a] - Age						
Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.
		B	Std. Error	Beta		
1	(Constant)	3.159	.130		24.362	.000
	Age	-.456	.184	-.139	-2.481	.014
	Average marketing strategy(MS)	.640	.054	.665	11.893	.000
2	(Constant)	3.158	.125		25.231	.000
	Age	-.452	.177	-.138	-2.551	.012
	Average marketing strategy(MS)	.367	.091	.382	4.027	.000
	AveMarketXAge (MSx*Age)	.450	.124	.344	3.636	.000
Coefficients[a]Education						
Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.
		B	Std. Error	Beta		
1	(Constant)	2.820	.378		7.462	.000
	Average marketing	.651	.055	.677	11.851	.000

	strategy					
	Education	.010	.083	.007	.123	.902
2	(Constant)	2.872	.389		7.390	.000

	Education	-.001	.085	.000	-.006	.995
	AveMarketXEdu	-.150	.252	-.130	-.595	.552

Coefficients[a] for Income

Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.
		B	Std. Error	Beta		
1	(Constant)	3.019	.086		34.936	.000
	Average marketing strategy	.650	.054	.676	12.102	.000
	Income	-.291	.128	-.127	-2.267	.025
2	(Constant)	3.006	.085		35.311	.000
	Average marketing strategy	.790	.075	.822	10.486	.000
	Income	-.261	.127	-.113	-2.055	.041
	AveMarketXIncome	-.327	.126	-.204	-2.603	.010

a. Dependent Variable: average purchase decision

The study created three sub hypotheses which tested the individual relationship of each indicator against the relationship between marketing strategies and purchase decision. Age and income had p-values of 0.00 and 0.010 respectively, at the significance level of $p<0.05$ the two indicators were found to have a significant moderating effect on the relationship between marketing strategies and purchase decision, however level of education was found to have no significant effect on this relationship as it yielded a p-value of 0.552.With high number of indicators showing a significant effect it can be concluded that customer characteristics were found to have a significant effect on the relationship between marketing strategies and purchase decision.

These findings are consistent with research by Trojanowski& Kulak (2017), where age was an important moderator in the use of a mobile phone; age is also considered an independent factor that influences buyer behavior (Kanagal, 2016). Mutuku (2011) found that respondents in the age group of 22-25 year were the largest respondents in the research and attributed age to biggest influence in brand preference for smartphones. Mudondo (2014) noted that age played a key role in understanding of technological advancement in the smartphones industry; youth are better placed to understand the current technology than the older generation.Income was found to have a significant effect on the purchase behavior among consumers in a study by Chen, Chen &Lin (2016). In research by Sethi (2017) income was the deciding factor on when the consumers bought their smartphones and from which store, the level of income also determined how much consumers were willing to pay for a smartphone. Lay-Yee, Kok-Siew& Yin-Fah (2013), Zab (2015) also noted that respondents between ages 18-35 had low incomes but were willing to pay more for higher priced smartphones with advanced features.

Research by Bringula et al. (2018) noted that even though respondents were computer literate undergraduate students preferred an in store purchase to an online purchase. Findings in a study by Christopher, John &Sudhahar (2014) indicated that education did not have a significant effect on peer influence regarding purchase decision for a smartphone. These findings can also be attributed to the fact the majority of respondents in the current study had a minimum education level of high school.

Conclusions and Recommendations

Marketing strategies was the independent variable with four indicators namely product, pricing, promotion and place strategies, the dependent variable was purchase decision and the moderating variable was customer characteristics which included age, education and income.When assessing the first objective it was found that product strategies like brand name, battery life, processing speed were found to have a significant effect on purchase decision among consumers of smartphones. Based on these findings it can be concluded that organizations need to look more into the product features like design and specifications when producing smartphones. The second objective found that pricing strategies like premium price, discounts, and free accessories had a significant effect on the purchase decision of consumers of smartphones. Based on this it can be concluded that both vendors and manufacturers work together to get effective pricing solutions.

Conclusion on the third objective based on research findings found that promotion strategies like use of social media, family and friends, television advertisements had a significant effect on purchase decision. Similarly conclusions drawn on the fourth objective found that place strategies namely warranty centers, stocking a wide variety of smartphones and easily accessible shops did have a significant effect on purchase decision among consumers of smartphones. Finally the fifth objective of the study which was to assess the moderating effect of customer characteristics on the relationship between marketing strategies and purchase decision, found that customers characteristics did have a significant effect on the relationship. Based on these findings it can be concluded that marketers should incorporate the demographic features of their customers when planning out their marketing strategies.

Contribution to the body of Knowledge

Study contributes to body of knowledge at the theoretical level by supporting the Stimulus response model, Howard and Sheth Model and the 4ps Model. It supports the stimulus response model by empirically proving that marketing strategies interacted by customer characteristics actually aid the steps arrived at in purchase decision. It supports the Howard and Sheth model by empirically supporting the input variables like marketing strategies, significative stimuli like advertisement and social stimuli like family and friends which contributes toward buyer behaviour and the ultimate purchase decision. The study also supports the 4Ps model which ascertains that the marketing strategies are directed towards the customer, marketing strategies have been seen to influence the consumers purchase decision. There have been few studies in Kenya focusing on purchase decision among consumers of smartphones and some whose results are often insufficient, the current research closes this gap by providing well researched results which give an accurate picture of the effect of marketing strategies on purchase decision.

Policy recommendations

Access to information is one of the articles enshrined in the Kenyan Constitution; the mobile phone has brought along with it numerous accesses to various types of information like access to government websites, health services, financial services, education services and so much more. As such the government through the Communications Authority and Kenya Bureau of standards should ensure that the quality of the smartphone imported into the Kenyan market is of high quality and that the manufacturer is able to offer after sale services like warranty and software support. A good quality handset not only safeguards the health of the consumer but also his or her money invested in purchasing the smartphone. Easy access to smartphone could improve their citizens' access to information and services offered by the government regardless of geographical boundaries without the need of investing in expensive equipment like desktop computers, internet connection and printers

The study has also demonstrated that manufacturers should focus more on creating smartphones that meet the needs, tastes, preferences and requirements of the customer. Today's consumer is looking to have a lot of features in one device so as to save them from purchasing and owning several devices doing different tasks. Manufacturers need to be creative in designing and creating smartphones that will attract and retain their customer base as technology is constantly evolving and the next design of smartphone might just make them lose a number of customers to the competitor.

INVESTIGATING THE EFFECTS OF LEADERSHIP COMMITMENT AND THE IMPLEMENTATION OF STRATEGIC PLANS IN NANDI COUNTY, KENYA

Isaac Kiprono Too, MBA Student

isaactook@gmail.com School of Business, Kenyatta University, Nairobi, Kenya

and

Godfrey Kinyua, PhD jefkinyua@gmail.com School of Business, Kenyatta University, Nairobi, Kenya

ABSTRACT

The Government of Kenya adopted strategic planning in various parastatals, institutions and ministries to address distinct and prioritized strategic agendas in order to uplift service delivery. In the County Government of Nandi, strategic planning is part of the on-going public sector reforms geared at improving effectiveness and efficiency in the prompt delivery of public services. Strategic planning in the County Government is aimed at achieving the sustainable development goals (SDGs) as well as the targets set in the Kenya's economic recovery strategy (KERS). This is one of the devotions of the Government of Kenya as a way of realizing her vision of providing accessible, affordable and quality services for all Kenyans. The core objective of this study was to determine the effect of managerial competence in the implementation of strategic plans in Nandi County. The research was carried out through a case study and interviews were conducted with the management, the sample populace and the functional staff with the help of interview guides. Nandi County developed its current integrated strategic development plan between the years 2013-2014 and during its implementation the strategic focus was on five wider objectives. However, the county continued to encounter managerial challenges in attaining her objectives. The research project sought to determine if County leadership, employees training, and resource allocations from the central government affect the implementation of the strategic plans. The target population for the project was members of the strategic management and implementation team of the various sub counties in Nandi County out of which all the 96 members were censured. The study employed a complete enumeration survey method where each and every item in the population was selected for the data collection. Primary data used in the study was collected using questionnaire which were self-administered while secondary data was collected from Nandi county's annual reports and the quarterly departmental reports, researches journals, books, articles, and the internet publications. The questionnaires were evaluated for content reliability and validity. Pilot study was done on 20 respondents who were not included in the main study. Data analysis began by sanitizing data and establishing recurrent themes from the respondents' description of their experiences. The data was then tested for completeness, coded, and analyzed. Tallying of the responses was carried out to generate information and to illustrate the general trend of findings about the respondents on the variables that were under study. The findings presentations was done using Statistical Package for Social Sciences (SPSS) software. Presentation took the form of tables, graphs and charts whereas qualitative findings were presented thematically. Majority of the respondents from the findings disagreed that the laid down strategies had been implemented. There was also no ideal period for the implementation of county strategic plans. Additionally, majority of the respondents agreed that there was need for improvement by benchmarking with other counties on the implementation of county strategic plans. The results of the study are of great significance to the county leadership and other related stakeholders in the various public or private sectors as it will recommend on parameters and or key indicators for improvement in the implementation of strategic plans. The study recommended that the county government of Nandi should give more priority to employment of woman so that the one –third rule envisage in the constitution of Kenya is realized. Additionally, the study recommended that top-level management should actively participate in formulation and implementation of strategic plans.

Keywords: Investigating the effect of Leadership Commitment and Implementation of Strategic Plans

1.0 INTRODUCTION.

Although strategy formulation is a challenging task for any most management teams, implementing and ensuring that the strategy works as predicted is more difficult (Hrebiniak, 2006). Various elements stand in the way of procedure by which strategic plans are transformed into executable steps in an organization. As opposed to strategy implementation, strategy formulation is perceived as an art, as opposed to a science, and its findings historically have been outlined as disjointed and diverse. Therefore it is expected that after deliberations on strategic decision, the implementation phase is faced with numerous challenges. The implications of these challenges are that the foreseen performance of any strategic decision may be unsuccessful in materializing despite there being a perfect strategy, as noted by Noble (1999b). Findings obtained from numerous researches have agreed to the same school of thought. A survey carried out by an economist deduced that 57 % of organization's were faced with challenges in carrying out strategic innervations throughout that last three years and similarly to a study of 276 top level operating managers in 2004 (Allio, 2005). Execution of Strategy in view the famous Chinese Corporation's White Paper of the year 2006, establishes that successful implementation of strategic plans are a very significant managerial impediment in most corporations currently. The survey reported based on the Chinese's document shows that greater percentage of firms and organizations at 83% evaluated did not achieved in the implementation of their strategy with a consistency as dismal as 17% which implied that they nailed consistency in the implementation of strategy process.

The cutting edge challenge for most of today's organizations is the implementation of strategy and it is common knowledge that there are numerous reasons that affect success of strategy implementation and not limited to the following; people who drive and oversee the strategy implementation and communicates of processes, co-ordination mechanisms and lastly benchmarks to strategic implementation process. Formulation and control is an intertwined loop that affect Strategy implementation Herbiniak (2006) argued that strategy formulation is challenging but executing and making strategy work is even more difficult and taxing. The findings of Cater & Pucko (2010) showed that majority of firms with 80% have the right strategies formulated, however it is only 14% of the sampled firms that have successful with the implementation stage. In establish the link between formulation of strategy and execution of the same strategy, Egelhoff (1993) studied the period or stage suits best a firm or organization to start thinking about implementation strategy. Failure of implementing a strategy that is well formulated might be in vain and also failure to implemented a strategy that which is not perfectly formulated or consider's most of the features of strategy implementation would end up with developing a pierced strategy with analysis paralysis hence executing it is misusing the scarce resources and the valuable time. Previous studies done by, Zaribaf & Bayrami (2010) manifested the same results which determined that most organization's managers labour most resources in developing a strategies, and fails to put in adequate resources to implementation phrase.

Several studies such as Cater & Pucko 2010, stressed developing and auctioning strategies with emphasis formulation other than implementation process cause of its difficulty. Formulation of strategy requires precision planning, leadership skills, and organizing resources alongside ensuring employees are committed to the newly developed strategy, while the implementation aspect requires scanning and understand market dynamics, creativity and lastly knowing the strengths of the firm or institution. Top level management is usually taxed with development of strategies while auctioning of the established plans is the duty of managers in the lower levels of management. Function of organizations executives is important in operationalization of strategy and clearly instructing mid-level managers who then proceed with implementation processes in a fluid manner.

Development of strategies is normally an entrepreneurial function which needs the understanding to judge, analyze, and innovate on the other hand laying down of strategy needs both managerial and administrative capability to anticipate challenges which could pop up during the implementation phrase. Strategic planning is an important management tool acclaimed internationally in terms of work performance by any organization since it set's the organization on a path of make or break (Bryson, 1998). A documented plan is the definition of a strategy that which

is geared at producing results which would redefine and redirect organizations to achieve a particular purpose by focusing in the future (Pearce & Robinson, 2007).

2.0 Literature Review

Hrebiniak & Joyce (2006), submitted that the process of implementing strategic plans is not only key and challenging but nevertheless it is also a difficult field for most researchers to study. Based on analysis of organizations exhibiting and sustaining a good performance index, the organization's ability to achieve in the short run is identified by four main factors affecting the desired output and it include the following aspects namely; starting efficient and effective firm, clearly designing a strategic path, starting a culture which is adaptive in nature and lastly moving from customer targeting and reduction of cost to the wider picture.

Also Hrebiniak & Joyce (2006), states that the people mandated with implementation requires a sequential and a simultaneous thinking which applies majorly to important decisions. The sequential thinking describe the nature of a relationship between interconnected activities and consecutives events. In the design of the logical sequence of causality one should think of an event to be implemented first, call it event (A). It subsequently lead one to question the consequences on task (B) and on the other hand questions the essential change in (B) which aids execution of task (A). The link between task A and B must be defined to show their relationship. After discerning the link between subsequent events up-to the end interconnection (Z) is determined. Though the use of sequential analysis under consideration of rational establishment in the procedure of implementation, narrowness and simplicity of range that is which remains undisclosed is not sufficient hence the need to infer using the ultimate effect in the structure and purpose of the firm if each of the occurrences is implemented and materializes.

Implementation process must not only be conceptually wide but also entirely center on exact tasks while carrying out analysis. It is a challenging task for organizations implanting sequential and simultaneous thinking in process of arriving at resolution. Additionally, fragmentation of convolution of challenges into smaller fragments lessen the cost of losing the broader intention. However, Manager's and the individual capabilities can provide the needed combination of exact and integrative analysis during the formulation period hence there for an organization must to institutionalize important capabilities entrenched in individual employees so as to maintain task over a given period(Joyce, 2009). The theory is used to emphasize independent and dependent variables of the study.

2.1Empirical Literature Review

Boonyada Nasomboon (2014) undertook a research to find out the correlation and linkage amongst Organizational Performance, Employee Engagement, and Leadership Commitment, through their influence a number of intervening variables for instance Alignment of strategy, Employer's Branding, Agility of an Organizational, and Practices of Human Resource management. Based on the relationships on existing theories a conceptual model was developed. The collected date was obtained from managers of the 26 petrochemical companies which were analyzed and identifiers of the dominant or untapped variables in the model were realized. Principles of structural equation was used in completing the process of modeling which needed confirmatory factor analysis on both the path analysis and measurement model on the structural model. After the analysis were carried out found out that Leadership Commitment has a direct effect on organizational performance. The research did not however explore the various management processes that would affect organization performance namely budgeting, staffing, planning, measuring performance, problem solving, and also clarifying jobs.

Well-developed strategies in combination with an effective and robust professional pool of employees are a very key resources determining the success of strategy, while poor leadership on the other hand is one of the greatest challenge in fruitful strategy implementation that is according to Pucko & Cater (2010). Lorange (1998) argued out that the top level management and organization executives must focus attention on the interfaces in the organization. The main obstacle during strategy implementation process is making sure that the work force is persuaded by set

goals and that they can focus their business understanding and potential to the new strategy hence the desire of an effective leadership supersede other factors. Eisenstat & Beer (2000) viewed the issue with a different school of thought and proposed that the absence of good leadership and most conflicting consideration will lead to inadequate or ineffective coordination because the work force will think that the executive or their management would favor in avoiding embarrassing circumstances and potentially threatening situations. The other responsibility of leadership is promoting transfer of information across and amongst the different levels within the structure of the firm. Blocking vertical communication has a specific negative effect on the organization's capability to refine and to subsequently implement its strategy that is according to, Eisenstat & Beer (2000).

Deriving from critical review of existing theories and related extant empirical literature, a conceptual framework displaying the relationship between the study variables is presented in figure 1.

• Leadership commitment

Figure 1: Conceptual Framework Source: Nandi County Annual Report, 2015

The conceptual framework in these project was a diagrammatic presentation of the interconnection between various independent variables and the dependent variable. The independent variable that determine the effectiveness of the implementation of strategies under consideration is leadership commitment. The dependent variable was the implementation of strategies.

3.0 Research Methodology.

Research design is a framework in used while generating solutions to research questions (Noum, 2007). The research objective is to collect data during a specific period and use it in describing the conditions of an existing nature. The research's problem was deliberated using a descriptive survey design. The design is normally employed when the study desires to describe the character identified in groups, approximate the people's proportion with determined characteristics and construct predictions. Borg & Gall (1996) recommended descriptive survey design because of its potential to generate statistical data of education aspect which is of value to the formulators of policy and researchers.

Mugenda & Mugenda on the other hand pointed out that descriptive researcher designs are suitable in determining and reporting the way things are. This design was chosen because the study was trying to determine the correlation between independent variables and the dependent variable in an existing circumstance. The dependent variable being implementation of strategic plans while independent variables were: leadership commitment, resource allocation and employee training.

The population study mainly focused on the strategic management teams of the different departments of the 6 sub counties in Nandi County. Both the management and the support staff were targeted from such departments as Public works, Planning, Environment, Basic Education, Housing, Finance and Public Sanitation and Health. All the targeted respondents did have a chance of being considered to take part during administration of the question in the studies questionnaires, hence bring the total study respondents in the research to 96 as shown in table 3.1.

The total target population of the study comprised of 96 correspondents including 84 employees and 12 administrators. In percentages, administrators comprises the smallest proportion at 12.5 % whereas the rest of the employees has the largest proportion of the total population at 87.5% as tabulated below.

Table 3.1 Target population

No.	Sub Counties	Target population (Administrators)	Censured Population (Administrators)	Target population (Clerks)	Censured Population (Clerks)	**Total of Censured Population**
1	Nandi Hills	2	2	11	11	**13**
2	Tinderet	2	2	12	12	**14**
3	Emgwen	2	2	14	14	**16**
4	Mosop	2	2	16	16	**18**
5	Aldai	2	2	17	17	**19**
6	Chesumei	2	2	14	14	**16**
	Total	**12**	**12**	**84**	**84**	**96**

Source: Nandi County Government (2015)

The instrument used to collect the primary data in the study was a self- administered questionnaire as attached as appendix 1. A questionnaire is a document designed specifically with a set of questions deliberately to steer responses from respondents primarily for data collecting (Ritchie & Lewis, 2013).

The questionnaire had open ended as well as the close ended questions. The questionnaire in this study was divided into four sections with each covering planning, implementation, monitoring and evaluation and project sustainability. Additionally, the instrument had five-point Likert scale format to ensure that respondents are well guided in answering the questions. A Likert scale is important in evaluation of a behavior on a continuum (Stoecker, 2012).

Secondary data was also obtained via the following sources namely; Nandi County's year and quarterly department reports, researches, journals, journals, articles and the internet.

Validity of instrument defines to the precision and accuracy in which an instrument measures what was intended to, for a particular purpose and a group (Saunders et al 2003). Johnson & Gill suggested that there are specific and certain criteria which could be employed in evaluating research findings. The research aimed at ensuring validity of the research instrument by use of simple mode of communication that which would easily be understood by the respondents. Opinions of other entities rendered sound judgment in respect to adequacy was heeded by the researcher. In ensuring that the questions tested what was desired to capture the researcher also engaged his supervisor. The validity of the research instruments were tested through a pilot research study. Responses were tabulated and any inconsistencies were corrected.

A pilot study was undertaken through random sampling from the targeted population. Vague questions were revealed by a Piloting exercise which allowed for review till the same meaning to all the subjects was conveyed (Mugenda & Mugenda, 2013). The researcher also able to check whether the variables collected could be processed and analyzed easily during the pri.test phase. The questionnaire's reliability was determined using Cronbach's Alpha where internal consistency is checked and the results are shown in the table 4.1.

Table 3.5: Reliability of the questionnaire

Study variables	Cronbach's Alpha (α)	Number of Items
Implementation of county strategic plan	0.667	4
Leadership Commitment	0.731	3
Employees Training	0.677	3
Resource Allocation	0.716	3
	0.70	**3.25**

Aggregate scores

Field data, 2018

Source: Pilot Data (2018)

The results illustrated that the aggregate score as per cronbach's Aipha **(α)** was 0.70 and it is established that dependent variables under the study were visible since their values of reliability exceeded the predetermined threshold of 0.6 in respect to Nunnally (1978).

Empirical data was collected using questionnaires through a drop-and –pick method. Research permit was sought from the National Commission for Science, Technology and Innovation (NACOSTI) to aid in the implementation of the research study. Any respondent that for some reason was not willing to participate in the study was excluded from the investigation. The identity of respondents' were not indicated anywhere on the data collection tools for confidentiality and the data gathered was only be used for academic purpose.

The collected data was edited and the responses were coded to allow the researcher to minimize errors during data entry and analysis of results. After coding, the data was carefully entered into the SPSS software using the codes assigned and a final check performed to ascertain the level of accuracy, completeness and consistency. The research data gathered was analyzed to generate the measures of both descriptive and inferential statistics. Descriptive statistics included such measures as frequency, percentages, sample mean, and sample standard deviation; however inferential statistics involved the use of bivariate correlation analysis and simple linear regression analysis.

The study was guided by the multiple regression models presented as follows:

$$Y = \beta_0 + \beta_1 X_1 + \beta_2 X_2 + \beta_3 X_3 + \varepsilon$$

Where Y – Implementation of county strategic plans, X_1- Leadership commitment, X_2– Employee training, X_3– Resource allocation, β_0– Constant term

β_1, β_2 and β_3 are coefficients of independent variables and ε - Error term.

4.2.1Gender Distribution of Respondents

The findings in figure 4.1 demonstrated that majority of the response at (73.8%) were male, while the other gender comprised of 26%. The results show that Nandi County staff is dominated by male gender. The one third gender rule envisaged in the Constitution of Kenya, 2010 was not satisfied.

4.3. Descriptive Statistics

The section presents findings related to the various variables of the study.

4.3.1. Leadership commitment

In order to evaluate the influence of county leadership commitment on implementation of strategic plans in Nandi County, the respondents were provided with statements related to leadership and asked to indicate the extent of their consent with each of the statements by ticking appropriately along a five point scale, where the responses were coded as follows for analysis with the SPSS version 23 Those who strongly agree (SA) = (1); Those who agreed (A) = (2) The undecided (UD) = (3); Those who disagreed (D) = (4); and those who strongly disagreed (SD) = (5). The responses are summarized and tabulated in table 4.4 below.

Table 4.3 Leadership Commitment

Statement	**Mean**	**SD**
The county leadership fully participates in the formulation and implementation of the strategic plans	**4.16**	**0.77**
	4.23	**0.73**
The county leadership carries out a thorough monitoring and evaluation on the implementation of the strategic plans		
	3.74	**0.82**
The county leadership is accountable for the implementation of the county strategic plans		
Aggregate Scores	**4.04**	**0.769**
n = 80		

Source: Field Data (2018)

From the findings, the respondents disagreed that the county leadership fully participates in the formulation and implementation of the strategic plans and that the county leadership carries out a thorough monitoring and evaluation on the implementation of the strategic plans as expressed by a mean score of 4.16, and 4.23 respectively. The respondents are undecided whether the county leadership is accountable for the implementation of the county strategic plans as expressed by a mean of 3.74. The study therefore indicates that the respondents disagreed that Nandi County leadership is committed to implementation of county strategies as expressed by an aggregate score of 4.04 based on the five point likert scale in the questionnaire.

4.4 Inferential Statistics

The findings related to analysis of the relationships between the dependent and independent variables of the study was discussed in this section. It contains results of regression and correlation analysis between dependent variable, implementation of strategic plans and independent variables namely leadership, employee training and resource allocation.

4.5. Regression Analysis

The findings related to analysis of the relationships between the dependent and independent variables of the study was discussed in this section. It contains regression and correlation analysis results between implementation of strategic plans and independent variables; leadership, employee training and resource allocation.

The model analysis of regression in Table 4.7 indicates the strength of the relationship between the independent variables (Leadership commitment, Employee Training and resource allocation) and the dependent variable (Strategy Implementation). The R square value in this case was 0.062, which clearly suggests that there is a strong relationship between Strategy Implementation and Leadership commitment, Strategy Implementation and Quality training, Strategy Implementation and resource allocation. This indicated that Leadership commitment, Employee training and resource allocation share a variation of 83.4% of Strategy Implementation.

Table 4.8: Regression Coefficients

Model		**Unstandardized Coefficients**		**Standardized Coefficients**	**t**	**Sig.**
		B	Std. Error	Beta		
1	(Constant)	1.050	.425		9.533	.000
	Leadership Commitment	.504	.098	.525	.036	.002
	Employee Training	.637	.084	.649	1.635	.000
	Resource Allocation	.340	.090	.355	.447	.002

Dependent variable: Implementation of strategic plans

Source: Field Data (2018)

From the table above $\beta_0 = 1.050$, $\beta_1 = 0.504$, $\beta_2 = 0.637$ and $\beta_3 = 0.340$

The simplified regression equation becomes

$Y = 1.050 + 0.504\ X_1 + 0.637\ X_2 + 0.34\ X_3$

The simplified regression equation becomes

$Y = 1.050 + 0.504\ X_1$

Table 4.9: Analysis of Variance

ANOVA[a]

Model		Sum of Squares	df	Mean Square	F	Sig.
	Regression	6.575	3	2.192	31.53	.027[b]
1	Residual	100.100	144	.695		
	Total	106.676	147			

a. **Dependent Variable**: Implementation of strategic plans

b. **Predictors**: Leadership commitment

The Anova table indicates that the overall model was a good fit since (F-value = 31.53 and p-value = 0.02<0.05)

Source: Field Data (2018)

The researcher sought to determine the effect of Leadership Commitment on implementation of strategic plans. The results of regression analysis in Table 4.10 demonstrated that Leadership Commitment is significant at β=0.504; t = 0.036; p = .002. This implies that at 95% confidence level, Leadership Commitment has a positive effect on implementation of strategic plans.

These results confirm that a unit increase in Leadership Commitment is responsible for 0.504 increases in implementation of strategic plans. Thus, this study concludes that Leadership Commitment affects implementation of strategic plans in Nandi County, Kenya.

5.0 Summary, Conclusion and Recommendations.

The objective of the study was designed to establish the effect of leadership commitment on implementation of strategic plans in Nandi County, Kenya. Leadership commitment was measured using indicators comprising of participation, monitoring and evaluation, and accountability. Results of the descriptive statistics analysis revealed that the data collected manifested that leadership commitment has a statistically significance on the implementation of strategic plans in Nandi County, Kenya and thus the expectation of this study was made. The conclusion section stipulates what the study reassures and gives major findings that the researcher postulated in each of the variables under the study.

The results of descriptive statistics analysis showed that the data gathered revealed that leadership commitment has a statistically significant effect on implementation of strategic plans in Nandi County, Kenya. Thus, the researcher concludes that leadership commitment positively affects implementation of strategic plans in Nandi County, Kenya. The study also recommends that the top-level management should actively participate in formulation and implementation of strategic plans.

5.5 Suggestions for Further studies

The study recommends further research to identify the other various aspects of leadership, for example, leadership style, that negatively affect implementation of strategic plans in the various counties.

ABSTRACT

Delinquent loans are in the rise both globally and locally leading to closures, receiverships and even collapse of institutions receiving and offering agricultural loans. The agricultural sector plays a very critical role in economic development, employment and wealth creation and as a source of revenue. The state of tea sector in Kenya currently is a combination of a number of factors; colonial history, socio-economic environment, regional economic relations, resource endowments and the general policy environment. This study therefore sought to determine the relationship between three macroeconomic variables namely, lending interest, inflation and foreign exchange rates; and delinquency of loans in the tea manufacturing companies managed by Kenya Tea Growers Association for the period Quarter 1, 2008 to Quarter 4, 2017. The study adopted explanatory research design approach and the population of study was 16 tea manufacturing companies. Secondary data on the macro-economic variables and delinquency of loans was collected and analyzed using E-Views software. The study findings reveal that at 95% level of confidence, the independent variables have no significant relationships (p=0.38). In the short-run, Error Correction Model depicts a significant relation between loan delinquency and the three macroeconomic for the period under study. Regression analyses depict negative relationships between lending interest rate, foreign exchange rate; and loan delinquency. Inflation rate reflected a positive relationship. The results of Autoregressive Distributed Lag Model revealed sufficient evidence of insignificant relationships between loan delinquency and the selected macroeconomic variables in the long run. This study notes that macro-economic environment should therefore, be monitored by the regulators and should take fiscal and monetary measures to ensure management of loan delinquency in the tea sector, and the economy as a whole.

1.0 BACKGROUND OF THE STUDY

Following global financial Crisis, recession has left institutions and individuals in debts, leading to loan delinquency and subsequently non-performance of loans. According to Addae-korankye (2014), loan delinquency 'results into loan default where a debtor has not met his or her legal obligation according to the debt contract'. The concept of loan delinquency is not new. For the European Union as a whole, NPLs was at over 9% of GDP 2014 end. In the United State of America, the percentage of NPLs to total loan was 2.21 percent in 2008 rising to 5.3 percent in 2010, after which there was a decrease from 4.5 percent in 2011 to 1.67 in 2015. The same pattern was experienced in the United Kingdom where the percentage rose from 1.56 in 2008 to 3.96 in 2011, followed by a decline to 1.04 percent in 2015. Germany recorded 2.85 percent of the total loans as NPL s in 2008, 3.03 percent in 2011 then 2.34 percent in 2014 (Statistica, 2017).

Agricultural credit institutions in developing and developed countries have been plagued by high default and delinquency rates. Delinquency rate for loans to finance agricultural production farm loans in Commercial banks in the USA was recorded at 1.19, 2.37, 3.04, 2.11, 1.56, 1.45, 0.9 and 0.84 percent for year 2008 to 2015 respectively (Board of Governors of Federal Reserve System of the US, 2017). 40 per cent of the borrowers in Sirsa district of Haryana, India repaid approximately 50 per cent of loan. 5 per cent of the borrowers repaid more than 70 per cent of agriculture loan (Bala, 2015). In the developing world, out of Naira (₦)7,188,575,000 loans granted to farmers registered under Agricultural Development Programes (ADP) in their states in Nigeria, between years 2009-212, only ₦ 3,523,018,005 of the total loan granted was repaid giving a default rate of 51 % (Obasi, 2015). Oladele and Ward (2016) concluded that 29.3 percent of loan beneficiaries from Micro Agricultural Financial Institution in North West Province, South Africa, did not repay their loan while 44 percent made partial repayment.
